In the legal proceedings involving Anaxagoras and Aspasia and in the trial of Socrates, popular feeling was no doubt exploited for political purposes. This motive in the prosecution of Socrates has been noticed already in the present Study in VII. vii. 472; and, in recording Diopithea's motion for the prosecution of 'disbelievers in the supernatural and teachers of theories about the heavenly bodies', Plutarch, in his *Pericles*, chap. 32, states that Diopithea was 'gunning for' (*ἀντιπεδοῦμενος* *εἰς*) Pericles by exploiting the feeling against [Pericles' friend and protégé] Anaxagoras. But *cherchez la politique* is not an adequate explanation of the outburst in 415 B.C. 'On this occasion a real religious hysteria broke out, for these events took place just before the great fleet sailed for Syracuse' (Nilsson, *op. cit.*, loc. cit.).

These manifestations of Zealotism at Athens during the Atheno-Peloponnesian War on the eve of the expedition against Syracuse had their counterparts at Rome during the Hannibalic War on the morrow of the Roman disaster at Cannae. When, at this juncture, two Vestal Virgins were found guilty of having broken the tabu against their indulging in sexual intercourse, one of them was punished by being buried alive, while the other only escaped this fate by an anticipatory suicide. One of the seducers, who was a pontifical clerk (*scriba pontificis*), was beaten to death by the Pontifex Maximus in person. But these savage punishments of members of the Roman official religious establishment who had been convicted of a ritual offence are not so horrifying as the propitiation of an angry Roman Pantheon by the gruesome rite of burying alive in the Forum Boarium four innocent aliens: a male and female Greek and a male and female Gaul (see Fowler, W. Warde: *The Religious Experience of the Roman People* (London 1911, Macmillan), pp. 319-20).

In the Early Modern Age of Western history an Athenian Zealot reaction against a rationalist enlightenment that had culminated in the judicial murder of Socrates had its counterpart in A.D. 1600 in the judicial murder of Giordano Bruno by a death which was as cruel as the deaths inflicted on their victims by Etruscan-minded pagan Roman ecclesiastical authorities in the panic following the catastrophe at Cannae.

¹ The heroically absurd word of command by which, according to a legend of the World War of A.D. 1914-18, a French subaltern, turned Tertullian-minded by the exaltation of despair, had conjured up into action again the no longer living effectives required for repelling an irresistible German assault on a trench which the Frenchman had been ordered to hold at all costs.

² Matt. xvi. 18.

³ It is no accident that the Idumaean Jewish statesman who offered to the Jews of his day a mundane solution of their Hellenic problem should have shared with the Galilaean Jewish Saviour who offered to them the insight to sublimate the same problem on to the spiritual plane the one common characteristic of being the offspring of new ground beyond the limits of a hard-baked Judaea. The cultural background of 'Galilee of the Gentiles' has been indicated in II. ii. 73-74 and in V. vi. 477-8 and 499. The policy of Herod the Great has been touched upon in V. vi. 123. This ex-Gentile statesman who forcibly kept a post-Alexandrine Palestinian Jewry out of trouble during his lifetime by compelling them to allow him to manage their affairs is 'the opposite number' of an ex-Jewish statesman who rehabilitated a nineteenth-century British Conservative Party by inducing them to place the management of their affairs in his hands. If Herod showed

prescription for Jewry's problem of coping with Hellenism was, first, to take the objective measure of this alien social force's irresistibly superior power with a sober eye, and then to learn and borrow from Hellenism every Hellenic accomplishment that it might prove necessary for the Jews to acquire for the judicious and practicable purpose of equipping themselves for holding their own, and even contriving to lead a more or less comfortable life, in the Hellenizing World that was their inescapable new social environment.

In a Zealot's eyes this Herodianism was a compromise that was as dangerous as it was impious and cowardly; but the Herodians could argue plausibly on behalf of their policy that it was preferable to the Zealots' impulse in every respect that was of any practical consequence. It was positive instead of being negative, and was therefore free to be active instead of condemning itself to be passive, whereas the Zealot line was hopelessly passive in spirit, however violently it might simulate activity in its foolhardy physical exercises. More than that, the Herodians could represent that, in following their own line, they were exhibiting a greater moral courage than any to which the Zealots could lay claim, since the attitude which the Zealots denounced as an Herodian opportunism was in truth simply the realism of minds strong enough to look facts in the face without flinching, to take these indisputable facts as they were, and to frame a straightforward policy on this firm basis.

Hellenism, the Herodians would say, was a hard fact which had successfully intruded itself into Jewry's social universe, and from which there was no possibility of escape. The Zealots' attitude of uncompromising non-recognition of the presence and power of this triumphant alien force was an attitude of moral cowardice entailing an impolicy of impossibilism that courted certain defeat. The one effective way for Jewry to cope with Hellenism was for the Jews to take to heart the manifest limitations of their own power; to recognize that their social universe could never be the same again since the emergence of Hellenism above the Syriac World's horizon; and to grasp, and act upon, the truth that Hellenism could be fought successfully only by the adoption of Hellenic weapons. According to the Herodian exposition of the case, the real choice lay between a voluntary Hellenization of Jewish life to whatever extent might be found necessary in the course of an empirical solution of the Hellenic problem *ambulando*, and an irresponsible Zealot impulse to ride for a fall in which Judaism would succumb to Hellenism altogether—with nothing to show for such a stupidly purposeless sacrifice beyond the poor consolation of having managed to make the mock-heroic Zealot gesture of shaking an infantile fist in an unimpressed Destiny's face. The Herodian's watchwords were *Fas est et ab hoste doceri*¹ and 'when you are in Rome, do as Rome does'. And, if a Zealot had been shocked by the Herodian's impiety into putting to him the searching question, 'Which of you by taking thought can add one cubit

himself less adroit than Disraeli in proving unable to carry out his policy without resorting to the crude expedient of repression, this was because, of these two audacious political acrobats, the ex-Gentile had committed himself to performing the greater *tour de force*.

¹ Ovid: *Metamorphoses*, Book IV, l. 428.

unto his stature?',¹ the Herodian would have replied without hesitation that he, for one, could answer that question in the affirmative—an answer indicating that, in spite of his air of rationalism, the Herodian, like the Zealot, was actuated by a faith which, in its Herodian vein, was perilously akin to hybris.

*A Survey of Zealot and Herodian Reactions*²

We cannot listen to the Herodian's and the Zealot's competitive expositions of their cases without being moved to ask ourselves two questions. How do these melodramatically contradictory attitudes stand to one another in fact? And does either of them prove to be an effective retort to the successful penetration of an assaulted body social by the cultural radiation of an aggressive alien society which is the common challenge evoking both these ostensibly opposite responses? It would be premature, however, to take up either of these questions before making a wider survey of the field of our present inquiry; for the two psychological reactions which we have just identified in the attitudes, and labelled with the names, of two factions which disputed between them the protagonist's role on the stage of Palestinian Jewish politics during the hundred years ending in A.D. 70 can, of course, be detected in many other passages of history; and these other manifestations of them may be expected to throw further light on their respective characters and on their mutual relations.

In the history of the Jews' encounter with Hellenism—to look no farther afield than this episode, for the moment—the phenomenon of Herodianism is already discernible by a date that anticipates Herod the Great's seizure of power in the Hasmonaeen Jewish principality in Palestine by at least a century and a half. Even if we reject as unhistorical the legendary account of the Septuagint's translation of the Jewish scriptures from the Hebrew and Aramaic into the Greek by a Ptolemaic royal command in the reign of Philadelphus (*regnabat* 283–245 B.C.),³ we can trace the beginnings of a voluntary self-Hellenization of the immigrant Jewish community in Alexandria right back to the infancy of this melting-pot city on the morrow of its founder's death; and even in the comparatively secluded hill-country of Judaea the High Priest Joshua-Jason, who is the archetype of the Herodian school of statesmanship, was busy as early as the fourth decade of the second century B.C. on his devil's work (as it appeared in Zealot eyes) of seducing his younger colleagues in the Jewish hierarchy into an indecently naked exposure of their bodies in an Hellenic palaestra and a shockingly vulgar screening of their heads under the broad brim of an Hellenic *petasus*.⁴ The *damnatio memoriae* through which Jason's Herodian escapade has been immortalized in the

¹ Matt. vi. 27.

² Much of the evidence cited in the following survey has already been presented in this Study in other contexts, especially in Part IX B, in the present volume, and in V. v. 58–712 and V. vi. 1–132, as well as in V. vi. 213–42. In the present chapter, references are given to the relevant passages in Part V but not to those in Part IX B.

³ According to Edwin Bevan, in *A History of Egypt under the Ptolemaic Dynasty* (London 1927, Methuen), p. 112, 'the translation of the Old Testament was made, bit by bit, in Egypt during the last three centuries before the Christian Era'.

⁴ See V. vi. 103–5, with the passage quoted from 2 Macc. iv. 7–17 on p. 104, n. 1.

Second Book of Maccabees is a revealing exhibition of the animus that Herodian policies arouse in Zealot hearts; and this provocation in high places at Jerusalem duly evoked a 'Zealot' reaction at least five generations before these anti-Hellenic Jewish fanatics had eventually acquired their historic soubriquet from a zeal for the Lord¹ which had long since eaten them up.²

Nor was Jewish Zealotism crushed out of existence by the military and political catastrophe of A.D. 70, nor even by its conclusive repetition in A.D. 135;³ for the gentle vein of Jewish Zealotism, consecrated in the legends of the old scribe Eleazar and of the Seven Brethren and their Mother,⁴ which had declared itself before the alternative violent vein had found vent in the militancy of the Maccabees, came into its own at last when Rabbi Johanan ben Zakkai responded to the tremendous challenge of the fall of Jerusalem under the assaults of Titus's storming columns by endowing Jewry with an inertly rigid institutional framework and a passively obstinate psychological habitus that enabled it to preserve its distinctive communal life in the frail clay tenement of a politically impotent diaspora.⁵

Jewry, however, was not the only Syriac community, nor the Syriac Society the only Oriental Civilization, to be divided against itself into an Herodian and a Zealot camp by the challenge of having to react to the impact of a post-Alexandrine Hellenism in one way or other. The Maccabaeian-tempered Zealot insurrections of non-Jewish Syrian plantation-slaves in Sicily in the latter decades of the second century B.C.⁶ were balanced at Rome, in the ensuing Imperial Age, by the Herodian flow of a stream of Syriac freedmen-converts to Hellenism which was satirized by a contemporary spokesman of an Hellenic dominant minority, in a celebrated phrase, as a noisome and unnatural discharge of the Orontes into the Tiber.⁷ Conversely, the Herodianism of a more well-to-do and more sophisticated stratum of the Syriac Society, which an Hellenic dominant minority was prepared to take into social partnership with itself on terms of virtual equality, was balanced by the conscription of other Syriac higher religions, besides Judaism, for the spiritually irrelevant and desecrating Zealot fatigue duty of serving as instruments for the waging of a secular cultural warfare. Zoroastrianism,⁸ Nestorianism and Monophysitism,⁹ and Islam¹⁰ all, in turn, followed Judaism's lead in making this spiritually disastrous deviation from Religion's true path. Yet the last three of these perverted religious movements all eventually made some subsequent atonement for their Zealot aberration by the Herodian act of translating into their Syriac and Arabic liturgical languages the classical works of Hellenic philosophy and science; and the Oriental manuscripts which survived in twentieth-century Western libraries to bear witness to the Herodian

¹⁰ See V. v. 673-9.

life-work of these assiduous translators would count for more in a judicious historian's estimation than the legend that the Caliph 'Umar had given orders for the burning of the books in the library at Alexandria.¹

In this pharos from which, by 'Umar's day, an Hellenic intellectual light had been streaming out into an encompassing Oriental darkness for a thousand years, the way had been prepared for the Syriac intellectual Herodians of the 'Abbasid Age by a Jewish Philo² and a Christian Clement and Origen.³ And even a stubborn Iranian rear-guard of the Syriac World's anti-Hellenic battle-order, which was not called upon to face the fire of Hellenism at the murderously point-blank range at which this artillery was discharged against a devoted Jewish vanguard, had to suffer first the annoyance of seeing a militantly Zealot anti-Hellenic Zoroastrian Church's domestic competitor, Mithraism, take an Herodian path into a mission field in *partibus Hellenicis*, where Zoroastrianism had made itself too odious to gain an entry, and then the humiliation of seeing the Zoroastrian True Faith itself sacrilegiously 'processed' for export to the Hellenic World by the ingeniously Herodian-minded heresiarch Mani.⁴

When we turn to consider the reactions to Hellenism in the other Oriental societies that had shared the Syriac World's experience of being subdued by Hellenic arms in and after the generation of Alexander the Great, we find the outburst of Jewish Zealotism in Judaea in the fourth decade of the second century B.C. being anticipated in the last decade of the third century B.C. by a Zealot *émeute* in Egypt,⁵ while the swift failure of Joshua-Jason's audacious Herodian attempt to Hellenize the priesthood of the Temple of Yahweh at Jerusalem was balanced in the Egyptiac World by the eventual success of a gradual movement towards converting the metropoleis of the Egyptian nomes into simulacra of Hellenic municipalities which began with the enrolment of young native Egyptian notables as Hellenic gymnasiasts.⁶ In a post-Alexandrine Babylonia a dwindling band of astronomer-priests, who were fighting a losing battle to preserve a more and more esoteric native cultural heritage against an invading Syriac culture's progressive encroachments, were so zealously bent on eluding the contaminating touch of the Syriac aggressor who was delivering this frontal attack that they inadvertently leaned over backwards into an Herodian Philhellenism;⁷ and it was no accident that in a later act of this play with three dramatis personae a fossilized remnant of the Babylonian Society which had managed to keep its head above the encompassing Syriac flood-waters on an unsubmerged Mesopotamian islet at Harrān should have taken a hand in the intellectual conversion of the Syriac Society to Hellenism in the 'Abbasid Age.⁸ In an Indic World which had been forced into an intimate contact with Hellenism by the Bactrian Greek war-lord Demetrius's invasion of

the Mauryan Empire's domain *circa* 183 B.C., we can likewise observe symptoms of our two familiar alternative psychological reactions in the Herodian Philhellenism of a Mahayanian Buddhist religious art¹ and in the anti-Hellenic vein in a Zealot-minded Hinduism.

This survey of the psychological reactions in the societies which encountered an aggressive post-Alexandrine Hellenism would be incomplete if we failed to notice one figure whose attitude cannot be accounted for adequately unless we are prepared sometimes to find the Herodian and the Zealot nature both incarnate in the same person. Mithradates VI Eupator, the Iranian-descended king of a successor-state of the Achaemenian Empire on the Hittite soil of Pontic Cappadocia,² presented an attractively Herodian countenance to the eyes of European as well as Asiatic Hellenes who welcomed him in 88 B.C. as their deliverer from a barbarous Roman yoke; yet the same war-lord wore the opposite appearance of an anti-Hellenic Zealot to the Cyzicenes who closed their city's gates against him in 74 B.C. and greeted the Roman general Lucullus as their saviour from the doom of falling under the alien yoke of an Oriental despot. The cultural ambivalence of this North-East Anatolian actor on a post-Alexandrine Hellenic stage is reminiscent of the enigma presented, in the pre-Alexandrine chapter of the same Hellenic story, by a Ducetius³ who, after having made his name as the unsuccessfully gallant Zealot leader of his Sicel fellow barbarians in the last round of their losing battle against Hellenic imperialism, lived to return to Sicily from an exile in the heart of the Hellenic World on the Herodian errand of founding in his homeland a new commonwealth in which Greek colonists and Sicel natives were to fraternize with one another in virtue of the natives' voluntary adoption of the intruders' alien culture.

If we pass on now to glance at the psychological reactions manifested in the societies that encountered a Medieval Western Christendom, we shall find the most thorough-going practitioners of Herodianism known to History up to date in those *ci-devant* pagan Scandinavian barbarian invaders who, as a result of one of the earliest and most signal of all Western cultural victories, became the Norman exponents and propagators of a Medieval Western Christian way of life. The Normans proceeded to embrace not only the religion but the language and the poetry of the Romance-speaking Western Christian native population of the successor-state that they had carved for themselves out of a Gallic province of the Carolingian Empire. When the French-named Norman minstrel Taillefer lifted up his voice to inspire his fellow knights as they were riding into battle at Hastings, he did not recite to them the *Völsungasaga* in Norse but chanted to them the Song of Roland in French;⁴ and, before William the Norman Conqueror of England high-handedly promoted the growth of a nascent Western Christian Civilization by a military act of self-aggrandizement which brought a backward and isolated province of Western Christendom under the influence of the metropolitan culture of the West in the most progressive of its

contemporary versions, other Norman military adventurers had embarked on the enterprise of enlarging the bounds of the Western Christian World in the opposite quarter through conquests at the expense of Orthodox Christendom and Dār-al-Islām in Apulia, Calabria, and Sicily.

The readiness of the Scandinavians to divert their psychic energy from the creative task of building up a promisingly precocious civilization of their own to the Herodian pursuit of adopting some alien civilization over whose native representatives they had established their military ascendancy was displayed in the adhesion of Scandinavian converts to other cultures besides that of Western Christendom, and in the conversion, not only of a vanguard that had planted itself within the domains of the civilizations to whose attractions it succumbed, but also of a rear-guard that received these alien culture-rays either in some barbarian no-man's-land or in the Vikings' Scandinavian home. The adoption of the Western Christian Civilization by the Scandinavian settlers in Normandy and the Danelaw, the influence of Byzantine and Islamic art and institutions on the Norman conquerors of Sicily, and the tincture of Far Western Christian Celtic culture that was acquired by the Ostmen in Ireland, and by the Norse colonists in the Western Isles, Iceland, and Greenland, are not such remarkable exhibitions of Herodianism—remarkable though they are—as the eventual conversion of the Scandinavian communities in and beyond the Celtic Fringe and in Scandinavia itself to the Western Christian culture, or as the adoption of the Orthodox Christian culture by the Russian Scandinavian conquerors of Slav barbarians in the basins of the Dniepr and the Neva.¹

In the encounters between the representatives of a nascent Scandinavian Civilization and their culturally alien neighbours, this Herodian tide had no difficulty in sweeping off their feet the 'die-hard' Zealot champions of an indigenous Scandinavian culture, though this original creation of the Scandinavian genius had a value which was worth preserving and a charm which might have been expected to inspire a more enthusiastic defence, while the victorious alien cultures had no physical force of their own, beyond the right arms of their Scandinavian converts, to pit against the spiritually abashed but militarily undefeated Berserkers. When we turn to survey the psychological reactions evoked by the impact of Medieval Western Christendom on the Syriac World and on the main body and the Russian offshoot of Orthodox Christendom, we find the balance between Zealotism and Herodianism rather less uneven here.

In the Syriac World a predominantly Zealot reaction against Medieval Western Christian aggression, which came to a head in an *union sacrée* of Dār-al-Islām against the lodgements made in Syria by the Crusaders,² was set off to some extent by the Norman-minded Herodianism of the Cilician Armenian Monophysite Christian converts to a contemporary Western Christian way of life. In the main body of Orthodox Christendom a likewise predominantly Zealot reaction expressed itself, as we have seen, in an execration of the Normans as 'Children of Hagar' and in a refusal to accept ecclesiastical union with the Western Christian

¹ These conversions of divers Scandinavian communities to divers alien cultures have been noticed in II. ii. 348-55.

² See V. v. 354, and pp. 353-6 above.

Church at the price of acknowledging the Papacy's supremacy over the Eastern Orthodox Churches, even though the manifest price of non-acceptance was the doom of falling under Ottoman Turkish Muslim rule; yet this demonically Zealot Orthodox Christian antipathy towards an aggressive sister Christian civilization was tempered, in a few East Roman hearts and minds, by an Herodian appreciation, not only of the expediency of an unpalatable ecclesiastical union, but of the nobility of the Western ideal of chivalry and the fertility of the audacious Western innovation of employing the currently spoken vulgar tongue as a vehicle for literature.¹

In the victorious revolt of Orthodox Christian Zealotism against an ecclesiastical union under Papal supremacy in accordance with the terms agreed at the Council of Florence in A.D. 1439, the Orthodox Church in Russia took the lead among the sundry national churches within the Orthodox communion in the resistance to Western ecclesiastical aggression, while the simultaneous Western political aggression against Russian Orthodox Christendom in the shape of sweeping Polish and Lithuanian conquests of derelict Russian territory, after the Mongols' catastrophic impact on Russia in the thirteenth century of the Christian Era had reduced her to military and political impotence, was countered in Muscovy by a political manifestation of Zealotism in the shape of an absolute authoritarian state in which an East Roman tradition and ideal of autocracy were re-embodied in new institutions that were original creations of the Russian political genius. Yet this Zealot seedling of Byzantine autocracy at Moscow, which had originally been called into existence as a windbreak against the icy blast of a Mongol Eurasian Nomad domination before being used to defend an unsubjugated remnant of Russian Orthodox Christendom against the predatory eastern marchmen of a Late Medieval Western Christian World, could not claim to be a more characteristic Russian response to the challenge of Western pressure in this age than the Herodian seedling of Medieval Western civic liberty which was bedded out contemporaneously at Novgorod.²

It is true that the *Gleichschaltung* of Novgorod's Western-inspired institutions and outlook, through the forcible incorporation of this *ci-devant* sovereign city-state into the dominions of a Muscovite 'Third Rome' in the eighth decade of the fifteenth century of the Christian Era, gave the Zealot answer a definitive victory over the Herodian answer to an insistent Western question in all parts of Holy Russia that had

¹ This contemporary Western example was the genial influence that encouraged the buried living waters of a rudimentary vernacular Greek literature to ooze up into the open through cracks in the ice-cap of a Byzantine classicism and to breed a native school of drama *alla Franca* in Crete in the course of the long-maintained Venetian political dominion over this Greek Orthodox Christian island (see pp. 392-4, above, and X. ix. 73-74).

² The voluntary entry of a Russian Orthodox Christian Novgorod into the commercial and cultural comity of a Medieval Western city-state cosmos is a more conspicuous, though more ephemeral, example of the cultural metamorphosis that is likewise exemplified in the history of the city-states founded on the coasts and adjoining waterways of Ireland by Ostmen who were kinsmen and contemporaries of Novgorod's original Scandinavian founders. In this context we may remind ourselves of a pre-Alexandrine Hellenic city-state cosmos's success in winning the cultural allegiance of the colonial city-states founded by the Hellenes' Libyphoenician and Etruscan commercial and political rivals in the Western Basin of the Mediterranean.

succeeded in keeping themselves politically inviolate from the stain of subjection to an alien Western rule; yet, even after the fall of Novgorod, Herodianism maintained an ascendancy over Zealotism during the next three centuries in those Russian Orthodox Christian territories that had been incorporated into the Western Christian kingdoms of Poland and Lithuania. On the ecclesiastical plane this Herodian proclivity revealed itself in a widespread—though not unchallenged and never all-embracing—acceptance of union with the Roman Church, on the terms agreed in A.D. 1439, by the Polish and Lithuanian Crowns' *ci-devant* Orthodox Christian subjects;¹ on the secular cultural plane the same vein of Herodianism found expression in a spontaneous progressive self-Polonization of the Orthodox and Uniate White Russian and Ukrainian, as well as the Latin Catholic White Russian and Lithuanian, nobility and gentry in the dominions of a Polish-Lithuanian United Kingdom.

Our pair of antithetical psychological reactions can also be detected in the histories of an Ottoman Orthodox Christendom's and a Hindu World's respective encounters with an aggressive Iranic Muslim Civilization.

In the main body of Orthodox Christendom under the *Pax Ottomanica*, a majority of the *ra'īyeh* belonging to the Millet-i-Rûm still clung to an ancestral religion whose ecclesiastical independence they had chosen to preserve at the price of submitting to an alien political régime; yet this Zealotism was partially offset, even on the religious plane, by the Herodianism of a minority who, from the fourteenth down to the seventeenth century of the Christian Era, were lured into apostasy from Christianity to Islam by tempting social advantages and dazzling political prizes that were the rich rewards for conversion to the religion of an Ottoman 'ascendancy'. A political ambition, that had sometimes prompted Orthodox Christian parents to welcome the conscription of their children into the Pādishāh's Slave-Household,² became a far stronger incentive to Herodianism in the hearts of Orthodox Christian subjects of the Porte when, in the course of the seventeenth century, new exigencies created by the rising pressure of the Western Christian Powers upon the Ottoman Empire moved the Porte to create new-fangled high offices of state to be held by Orthodox Christian *ra'īyeh* without their being called upon either to renounce their ancestral faith or to forfeit their personal freedom.³ Meanwhile, the rank-and-file of the Millet-i-Rûm, who, short of becoming free Muslims or Ottoman public slaves, did not enter the Ottoman public service even as unconverted freemen, had long since

¹ This comparative success of the Uniate movement among the Orthodox Christian subjects of the Western Catholic Polish and Lithuanian Crowns, by contrast with its signal failure among the Orthodox Christian subjects of an Orthodox Christian East Roman Empire, was remarkable, considering that the Ukrainian and White Russian converts to Uniatism lacked the political incentive which, in Greek Orthodox Christendom, had moved a sagacious Michael Palaiológos to action as early as A.D. 1261 and had become so obviously urgent there by A.D. 1439 that it could then be ignored there only by a Zealot's wilfully blind eyes. In Greek Orthodox Christendom the choice was one between ecclesiastical union with Rome and subjection to an alien political yoke, whereas the converts to Uniatism among the Orthodox subjects of Poland and Lithuania could not imagine that they were purchasing their escape from a political calamity that had already long since overtaken them.

² See III. iii. 37, n. 1.

³ See II. ii. 224-5.

succumbed to Herodianism in much larger numbers in the more trivial, yet nevertheless significant, ways of learning to talk their Ottoman masters' language¹ and to ape their dress.

The story of the Hindus' psychological reaction to the rule of an Iranic Muslim 'ascendancy' runs on much the same lines. While a vast majority of the Hindu *ra'îyeh* of the Timurid Mughal Muslim emperors of India and their Afghan and Turkish Muslim forerunners emulated the Orthodox Christian *ra'îyeh* of the 'Osmanlis in zealously resisting the temptation presented by potent social and political inducements to apostatize, there were local mass-conversions to Islam—particularly among the socially depressed *ci-devant* pagan converts to Hinduism in Eastern Bengal—that would appear to have been on a greater scale, not only absolutely but also relatively to the total head of population in question in either case, than the corresponding local mass-conversions to Islam among the Albanian, the Epirot and Cretan Greek, and the Pomak Bulgar Orthodox Christians and among the Bosniak Bogomils. Moreover, the Brahmans showed the same alacrity as the Phanariots in entering a Muslim Power's public service as unconverted freemen, and the same facility in adopting their Muslim masters' language² and dress.

The history of an Iranic Muslim Society's impact on the Orthodox Christian and Hindu worlds also offers us two examples of psychological ambivalence. The new religions founded by Sheykh Bedr-ed-Dîn Simâvî in a fifteenth-century Western Anatolia³ and by Guru Nanak in a fifteenth-century Panjab⁴ were ostensibly expressions of a radical Herodianism; for both prophets proclaimed the fraternity and equality, on their own new common spiritual ground, of all their converts, whatever their divers religious antecedents; and the common ground on which, according to Nanak's revelation, the traditional divisions between Hindus and Muslims and between members of different Hindu castes were no longer valid was an article of Nanak's faith that was not of Hindu but of Islamic provenance. Like all converts to Islam, all converts to Sikhism became one another's brethren and peers in virtue of their having all alike given their allegiance to one Lord whom they had been taught to worship as the sole True Living God; and this tenet was so fundamental that Sikhism might be described with no less truth than brevity as an Herodian response to the impact of an Islamic monotheism upon the Hindu consciousness. Yet these intellectually convincing grounds for classifying Sikhism and Bedreddinism as expressions of Herodianism would have seemed academically irrelevant to the Mughal Emperors Jahangîr and Awrangzîb, and to the Ottoman Emperor Mehmed I, when they were encountering their Sikh and Bedreddinî *ra'îyeh* on the battlefield in armed rebellion against an Islamic 'ascendancy'; and, if these Iranic Muslim potentates had been required to employ the psychological terminology of this Study, we may feel sure that they would have entered the names of Har Govind, Govind Singh, Bedr-ed-Dîn, and Mustafâ Börklüje in the Zealot, not the Herodian, column of our present inventory.

³ See V. v. 514-22.

⁴ See V. v. 106 and 665-8.

When we come to the encounters with the Modern Western Civilization which had overtaken all the contemporaries of this potently expansive society, we see the offshoot of the Far Eastern Society in Japan reacting to the impact of the West with vigour along both the two alternative lines.

The strength of the Herodian current in Japan was demonstrated more impressively by its persistence in adversity than by its exuberance before it fell on evil days. The eager curiosity that inspired a facile adoption of the Western weapons, dress,¹ and religion imported by Portuguese traders and missionaries during the honeymoon period, when Japan was making her first acquaintance with the West in the latter decades of the sixteenth century of the Christian Era, was justified by the silent heroism of this dubious wisdom's children² when, after the Tokugawa régime had ordered its subjects, under pain of death as the penalty for disobedience, to break off relations with the West and to renounce the imported Western religion,³ a remnant of Japanese crypto-Christians remained secretly loyal to their proscribed alien faith for more than two hundred years—as became apparent when, after the Meiji Revolution in A.D. 1868, it became possible for them at last, in the ninth or tenth generation, to come out into the open again.

This second outburst of Herodianism in Japan in the middle decades of the nineteenth century was also, as we have seen, partly the work of other heroes who had risked and lost their lives in a non-religious Herodian cause by secretly studying Modern Western Science in a Dutch medium without waiting for the fall of an intolerantly Zealot-minded Tokugawa Shogunate. In the rediscovered light of these long-hidden candles⁴ the Meiji Revolution in its day looked like a deferred but definitive triumph of an Herodianism which had been the predominant vein in the original Japanese response to the challenge of the West; yet, in this second bout, as in the first, the experience of half a century was to put a Zealot face on the reality behind Herodian first appearances—with the implication, for an historian's long-sighted eye, that the Tokugawa period, in which Zealotism had been in the ascendant, had, after all, been something more than an irrelevant interlude in a Japanese psychological drama in which Herodianism was the 'secular' trend (in the economists' technical use of the word).

The strength of the Zealot current in Japan had been indicated from the outset by the assiduity with which the Japanese had equipped themselves for holding their own against the formidable Western strangers by the ostensibly Herodian feat of learning how to make, as well as use, new-fangled Western fire-arms; and it was significant that the Tokugawa Government, when it set itself to sever relations between Japan and the West, cannily refrained from following up its veto on Western commodities and Western religion by renouncing the employment of Western weapons. This statesmanlike disregard for logic was justified by the sequel; for the Tokugawa eventually forfeited a political ascendancy founded on military force when their military impotence to prevent

³ Matt. xi. 19; Luke vii. 35.

⁴ Matt. v. 15; Mark iv. 21; Luke viii. 16 and xi. 33.

Commodore Perry's squadron from entering Yedo Bay in A.D. 1853 made it alarmingly manifest to the Japanese public that, in the course of 215 years of deliberate self-isolation, the Bakufu had allowed its stationary seventeenth-century Western armaments to be left so far behind by the never-ceasing and ever-accelerating progress of Western military technique that the régime had at last become altogether incompetent to live up to its acknowledged *raison d'être* of keeping the West at arm's length from the sacrosanct Land of the Gods. Between A.D. 1853 and A.D. 1868 this public zeal in Japan for an effective fulfilment of the Tokugawa's neglected Zealot mission displayed itself not only in a growing insubordination towards the authority of this now discredited indigenous régime but in a rising wave of xenophobia, foaming over into physical assaults, against Western intruders whom, in the meanwhile, the Bakufu had been constrained by Western political pressure to readmit within its precincts; and the revolution in which a thus patently irreclaimable Tokugawa régime was ruthlessly liquidated was the work of descendants of Kyushuan pupils of the Portuguese who had made up their minds to repeat their sixteenth-century ancestors' achievement of mastering Destiny by acquiring the superior military technique of the West in its most up-to-date form.

While this Japanese revolution can be presented as a triumph for Herodianism in the accurate statements that its economic programme was a thorough-going adoption of the material technique of the contemporary Western World and that its political programme was the entry of Japan into the contemporary Western comity of nations, the same revolution can be presented simultaneously as a triumph for Zealotism in the likewise accurate statements that the intention inspiring the technological revolution was to turn Japan into a Great Power of the contemporary Western standard, and that she was resigning herself to the necessity of entering the arena of Western power politics because she had come to realize that this was the only condition on which she could continue to hold her own against the West on the face of a planet that had now been magnetized by Western arts into a single indivisible field of force. The latent Zealotism of the strategy behind the Herodianism of Japan's tactics during the three-quarters of a century ending in A.D. 1945 was indeed divulged as early as A.D. 1882 in the official organization of the State Shintō, in which a resuscitated pre-Buddhaic paganism¹ was utilized as a vehicle for the deification of a living Japanese people, community, and state through the symbolism of an archaic cult of an Imperial Dynasty that was reputed to be the divine offspring of the Sun

¹ The origins of this archaistic Neo-Shintō movement can be traced back to the seventeenth century of the Christian Era, and its antecedents to the fifteenth century (see V. vi. 90, with n. 4). It was always suspect to the Tokugawa on account of its potentialities for serving as the ideology for an alternative régime based on a revival of the latent prestige of the Imperial Dynasty (see *ibid.*, p. 91, n. 3). The Tokugawa régime had sought to parry this threat to its stability by patronizing rival religions and philosophical movements. It had favoured the Mahāyāna and had encouraged an archaistic revival, not of Shintō, but of Confucianism (see *ibid.*, pp. 90-91, and Murdoch, J.: *A History of Japan*, vol. iii (London 1926, Kegan Paul), p. 97). In promoting the propagation in Japan of a Neoconfucian Movement that had originated in contemporary China, the Bakufu was employing Herodian tactics for attaining its Zealot strategic objective.

Goddess and that offered its hereditary collective divinity for worship here and now in the epiphany of a god perpetually incarnate in the person of the reigning Emperor.¹

It will be seen that, during the four hundred years ending in A.D. 1952, the Japanese psychological reaction to the ordeal of encountering the West had been ambivalent through and through.

The ultimately Zealot motive underlying a superficially Herodian-looking policy that has here been ascribed to the Japanese in and after the Meiji Revolution of A.D. 1868 was ascribed to the contemporary Chinese, on the morrow of the consummation of the Kuomintang Revolution in China in the third decade of the twentieth century, by a learned and acute student of Far Eastern history who was inclined at that date to take current Japanese Herodianism at its face value, or at any rate to judge that the latter-day Japanese importers of Western cultural wares were deceiving themselves in so far as they seriously expected to succeed, by the sophisticated means of a nicely calculated and strictly regulated dole of cultural rations, in eluding our empirically established social 'law' that, when once a society's defences have been penetrated by the radiation of an intrusive alien culture, 'one thing leads to another' inexorably until, willy nilly, the assaulted party has to resign himself to adopting the assailant's way of life *in toto*.

'The first approach of the West was resisted in Japan, as in China; but, when Perry demonstrated that the West "amounted to something", the effect approximated to a revelation, and was so accepted. . . . It is China, on the contrary, which has endeavoured to use the weapons of the West to preserve itself from the West. . . . The whole history of Chinese relations with the West implies an underlying instinctive playing for time, in the hope that the West would exhaust itself and China be able to assert once more the superiority of which the Chinese are morally convinced.'²

Twenty years after the publication of the book from which these passages are quoted, at a moment when Japan was under Western military occupation and China was under the rule of an indigenous Communist régime, it was manifestly rash to make a more than tentative and provisional estimate of the 'secular' psychological trend in either of these two provinces of the Far Eastern World; but it was nevertheless possible to observe unmistakable symptoms of both Herodianism and Zealotism in this episode of Chinese history, and also to notice certain likenesses and differences between the Chinese and the corresponding Japanese episode in respect of both the interplay and the relative strengths of the two alternative reactions.

The light-hearted adoption of current Western fashions by late-sixteenth-century and early-seventeenth-century Japanese barons and their retainers had its counterpart in the frivolous curiosity in regard to astronomical instruments and other toys of Modern Western Science that the Jesuit guests at the Imperial Court in Peking had the wit to arouse in the minds of Ming and Manchu emperors and Confucian literati; yet

¹ See V. v. 707, n. 2, and V. vi. 93.

² Lattimore, O.: *Manchuria, Cradle of Conflict* (New York 1932, Macmillan), pp. 85-88.

in China, as in Japan, the interest in Western fire-arms was both more serious and more sinister; and in China, as in Japan, again, adversity, in the severe form of official persecution, demonstrated the sincerity of the Herodianism of converts who became martyrs to their alien Christian faith,¹ while the eventual obsolescence of the ban on the profession of Christianity brought to light the persistence of Herodianism on the religious plane in China likewise when a fresh harvest of converts was reaped there by nineteenth-century successors of the proscribed Early Modern Western Christian missionaries.

This second wave of Herodianism was transmitted, in China too, from the religious plane, on which it first made its reappearance, to the secular planes of education and business. Mission-educated Chinese converts to Protestantism completed their studies in the universities of the United States, and penurious Chinese emigrants established themselves in force as efficient and prosperous Westernizing business men in a number of South-East Asian countries—the Philippines, Indonesia, Malaya, Indo-China, and Burma—that had fallen under Western rule and had in consequence been incorporated into a Westernizing World on the economic plane as well as the political.² This Chinese commercial diasporá, as well as the Chinese *alumni* of Western educational campuses on both Chinese and Western ground, had played a part, out of proportion to their numbers, in an Herodian political movement—Sun Yat-sen's Kuomintang—which had attempted in the second quarter of the twentieth century of the Christian Era to emulate the achievement of the Japanese authors of a Meiji Revolution who had succeeded in obtaining admittance for their country into the contemporary comity of Western states on a footing of equality with the original members of the club.

On the other hand, a Zealotism that had gained the upper hand in Japan eventually—in the fourth decade of the seventeenth century—had declared itself in China promptly at the beginning of the history of Chinese intercourse with the West. Ming emperors who had welcomed Western apostles of Christianity to their imperial capital had anticipated the Tokugawa Government's tardy precaution of confining the Dutch remnant of a Western commercial community in Japan to the islet of Deshima; for the Chinese imperial authorities had never permitted Western traders of any nation to reside on Chinese soil outside the confines of the Portuguese settlement at Macao and the mudbank of Shamen in the West River off the water-front at Canton, which was made to serve the purpose of a convict hulk for the internment of Western traders of all nations during their strictly limited and regulated seasonal visits. Even after the jealously locked, barred, and bolted gates of a Chinese Earthly Paradise had been blown in by British naval broadsides in the Sino-British 'Opium War' of A.D. 1839-42, a humiliatingly defeated Chinese Government still managed, in the ensuing peace settlement, to prevent the now inevitable enlargement of the resident Western

¹ The Battle of the Rites and its tragic outcome have been noticed in V. v. 366-7 and 539.

² The Chinese diasporá in Siam should be added to this list, notwithstanding Siam's success in preserving her political independence down to the time of writing.

traders' 'pale' from being extended beyond half a dozen specified 'treaty ports'. Missionaries of the Christian religion were the only Westerners who were then granted the privilege of travelling and residing at will throughout the length and breadth of Chinese territory; and the progressive increase in the number of Western treaty ports and in the weight of Western influence in China in the course of the last six decades of the nineteenth century provoked a cumulative resentment in Chinese hearts which culminated in demonic eruptions of militant xenophobia.

The Boxer Rising of A.D. 1900, like the sporadic outbreaks of Zealotism in Japan during the years A.D. 1853-68, was directed in the first place against a decadent indigenous régime whose dubious title to legitimacy was now challenged on the score of its manifest incompetence to resist the encroachments of Western intruders who were the rebels' ultimate target. An incurable inability to carry out the Zealots' anti-Western requirements was the offence that cost the Manchu imperial régime in China its life in A.D. 1911, as it had been the cause of the Tokugawa Shogunate's downfall in Japan in A.D. 1867-8. The Manchu Dynasty's doom had been sealed by its supreme and unpardonable offence of having owed its reprieve, eleven years back, to the bayonets of the alien international expeditionary force that had raised the Boxers' siege of the Legation Quarter in Peking; and the execution done by the Western sword with which the Boxers had perished¹ in A.D. 1900, and the T'ai-p'ing before them in A.D. 1864,² like those militant Jewish followers of Theudas and Judas who had once ventured to try conclusions with the Romans,³ did not deter a third generation of Chinese Zealots in A.D. 1925 from rushing into a fresh campaign of militancy which, in the teeth of all the forbidding precedents, was to justify itself by its success in bringing about the progressive abolition of 'the Unequal Treaties'.

Moreover, the ambivalence which we have found pervading all phases and aspects of the Japanese psychological reaction to the impact of the Modern West was discernible in the Chinese arena likewise in at least two movements. We have just now classified the T'ai-p'ing as a Zealot revolt against a semi-alien Manchu imperial régime which, in Zealot Chinese eyes, had forfeited any mandate to which it might have been able to claim title through its failure to prevent the unceremonious pioneers of a wholly alien Western World from breaking their way into the Middle Kingdom's sacrosanct precincts by force of arms. But such an account of the T'ai-p'ing would be misleadingly incomplete if we did not go on to remind ourselves that the inspiration of its founder Hung Hsiu-ch'uan's mountain-moving faith had come, not from the Confucian Classics, which he had studied without showing the ability required to qualify as a litteratus, but from tracts compiled by a Chinese convert of a Protestant Western Christian missionary;⁴ and the Western manufacture of the spring that thus released this Chinese prophet-pretender's

¹ Matt. xxvi. 52.

² A Manchu régime whose old-fashioned troops had signally failed to suppress the T'ai-p'ing had owed its salvation in this crisis to a new-model force organized and led for it by a Western mercenary soldier who consequently came to be known among his compatriots as 'Chinese Gordon'.

³ Acts. v. 36-37.

⁴ See V. v. 107, n. 1.

energies requires us to enter his name in the Herodian column of our inventory as well.

This recourse to the device of double entry was also the only adequate method of classifying the more recent phenomenon of Chinese Communism; for, while this movement, too, had an indisputable claim to a place in the Zealot column on the score of its implacable enmity towards its Herodian contemporary and rival the Kuomintang, the subtly pervasive taint of Herodianism also betrayed itself in the war-gear of a Chinese anti-Western movement that had borrowed the ideology of Communism from a Russian armoury; for Russia was not herself the artificer of the Marxian thunderbolt, but had imported this ideological weapon for her own use from the forge of a nineteenth-century Western heresiarch before re-exporting it to China for employment on the local anti-Western front in a 'cold war' that was then coming to be waged on an oecumenical scale.

In the psychological reactions of the pre-Columbian civilizations in the Americas to the appalling advent of militarily irresistible aggressors from a previously quite unheard-of and all but undreamed-of alien world overseas, the Zealot heroism of the Inca 'die-hards', who held out in an Andean mountain-fastness for thirty years after the Empire of the Four Quarters had fallen before the horse-hoofs and the fire-arms of the Spanish *conquistadores*,¹ flared up again, more than three hundred years later, in the insurrection of a pretender to the tragically inspiring name of Tupac Amaru in A.D. 1780-3;² but this vein of Zealotism in an overwhelmed Andean cosmos was balanced in the original Tupac Amaru's generation, on the morrow of the conquest, by the Herodianism of half-breed children of Spanish *conquistadores* and Inca mothers. The work of the half-breed Jesuit Father Blas Valera perished in manuscript, before publication, in the siege of Cadiz by the English in A.D. 1596,³ but the work of his fellow half-breed Garcilaso de la Vega⁴ (*vivebat* A.D. 1540-1616) was preserved to be the principal repertory of the Incas' traditions about themselves in the libraries of these Andean empire-builders' Western supplanters. This soldier-historian had gathered his ancestral traditions in his Quichuan mother-tongue from the survivors of the last generation of antediluvian Inca grandes before he left his Andean fatherland for ever at the age of twenty to serve on European battlefields as an officer in the Spanish Army; but he survived thirty years of military service to set down on paper in Castilian at Cordova in his riper years the oral information that he had garnered in Quichuan at Cuzco in his boyhood.

This evanescent Herodianism of a handful of half-breeds belonging to a single generation in the sixteenth century is a less impressive instance of the Herodian psychological reaction in the Andean World than the subsequent miracle of the adoption of the current Western Civilization in a Catholic Christian medium by the Guaraní transfrontier barbarians

¹ See V. vi. 213.

⁴ A note of Garcilaso de la Vega's career will be found *ibid.*, p. 12.

in Paraguay *en masse*. In the Paraguayan 'reductions' the spell-binding charm of the Jesuits' Orphean music worked the magic of securing a truce to the ferocity which these Western Christian culture-heroes' temporarily docile Guaraní converts, pupils, and protégés had displayed, before this interlude, as barbarian invaders of the Andean World, and which they were to display again as cannon-fodder in the international and civil wars of the Latin-American successor-states of the Spanish and Portuguese Empires. This summer of unwonted peace and prosperity between two bouts of frantic militarism lasted in Paraguay for the best part of two centuries (*circa* A.D. 1580-1773) and was terminated only by the Spanish Crown's wanton crime of liquidating an idyllic hierocracy.¹

When we turn our eyes from the Andes to Central America, we find there an illustration of the Herodian reaction in the readiness with which a subjugated indigenous peasantry in the Spanish Viceroyalty of New Spain embraced a version of a Tridentine Catholic Christianity in which the natives' Castilian religious instructors discreetly overlooked the infusion of a reassuring alloy of their converts' pristine paganism. On the northern fringes of the same Mexic World the antithetical ethos of Zealotism displayed itself in the gentle persistence with which an indigenous religion and way of life were treasured by the Pueblo and other agricultural sedentary communities that had been ceded by the Republic of Mexico to the United States in A.D. 1848; while, still farther afield, among the Nomadic hunting tribes of North America, the same Zealot spirit gave birth to new indigenous religions² under the agonizing ordeal of an assault by which these most unhappy of all American victims of aggression from overseas were being deprived, not merely of political freedom, but of the possibility of continuing to lead an ancestral way of life that had depended on a freedom to range over their now stolen hunting grounds.³

In the psychological reactions in the Central American World we also find examples of the phenomenon of ambivalence. The revolution that broke out in Mexico in A.D. 1910 might look, on the surface, like a social conflict in which the line of division between the combatant parties conformed to the conventional Western pattern of the day; yet a more penetrating eye would discern that these Mexican laymen, peasants, and workers in revolt against prelates, landlords, and employers who were largely of West European and North American provenance were also Zealot champions of a submerged Mexic culture against the ascendancy of an alien civilization that had originated in the Old World. In a neighbouring section of the same continent in an earlier generation the savage military resistance offered to the encroachments of White Men from overseas by Apaches, Comanches, and other Indian denizens of the Great Plains who had learnt from their assailants the Eurasian art of

horsemanship was likewise impossible to describe adequately without calling these fierce warriors both Zealots, in virtue of their recalcitrance to their White executioners' lethal designs, and Herodians, in virtue of their receptivity in borrowing from their adversaries an imported animate weapon which was providentially apt for use in a hitherto horseless 'Centaur's' paradise'.

In the psychological reactions of the Jewish fossil of an extinct Syriac Civilization to an encompassing and oppressive Western Christendom among which this Jewry was dispersed, we shall find a classical illustration of Zealotism in the meticulous observance of the Mosaic Law by orthodox Jews who had faithfully followed Rabbi Johanan ben Zakkai's admonitions to seek in the practice of this social drill their palladium for preserving their distinctive communal identity in diaspora; and in the same field we shall also find a classical illustration of Herodianism in the whole-heartedness and the virtuosity with which all the Jews in the West—Ritualists, Liberals, and Zionists alike—participated in the secular activities of the Western Gentile World on the economic plane.

In a Late Modern Western World in which the walls of the ghetto had fallen at the sound of a Revolutionary French trumpet, a latter-day Liberal School of Jews seized the opening thus offered to them for carrying their Herodianism beyond the economic plane on to the political and the personal. When once the pungent elixir of Rabbinical Judaism had been volatilized in the Jewish Liberal's Late Modern Western intellectual crucible to a degree of insipidity at which a Jewish citizen of the Netherlands, France, Great Britain, or the United States could be described as 'a Dutchman, Frenchman, Englishman, or American of Jewish religion' not less accurately than his Gentile fellow Liberal and fellow countryman could be given the corresponding label of a Dutchman or what-not of such-and-such a Christian denomination, it became comparatively easy, in the intellectual and emotional environment of an ex-Christian Liberal World, for latter-day Jewish Herodians to carry the process of assimilation to the further stage of abandoning even their formal membership in a Jewish community and intermarrying with neighbours and fellow citizens of Gentile origin. What sense was there, for a Liberal's rational mind, in a Mosaic ban that debarred Jews from *connubium* with Gentiles with whom all Jews in diaspora must always practise *commercium* in order to earn their daily bread?

The effort of breaking with traditional Jewish habit and prejudice which was entailed in such a defiance of a Mosaic tabu on mixed marriages might come easiest when the parties could meet and mate on a common ground of ex-Jewish and ex-Christian religious agnosticism; but an ex-Jew who had gone that far would no longer find it very difficult to pay a tribute to conventionality at a cheap rate by submitting to the formality of a baptism that would purchase for him a nominal membership in one of the less unfashionable of the Christian churches of the day. The anti-clockwise pilgrim's progress of the Jewish Herodian in a Late Modern Western World had illustrated the facility with which 'one thing leads to another' by going to these lengths before an outraged Moses was vindicated and avenged by a maniac Hitler who provided

himself with pariahs for penalization *more Visigothico* by routing out these 'non-Aryans' from the Gentile communities into which they had passed so adroitly, in order to thrust them back against their will into their deliberately abandoned invidious traditional role of being 'a peculiar people'.

At the time of writing on the morrow of a Second World War, both the Herodian 'non-Aryan' and the Zealot Ritualist survivors of the Jewish diaspora in the Western World had lost the lead in a Western Jewry to a Zionist movement that differed from both these other diasporan reactions alike in displaying an ambivalent affinity with both of them simultaneously.¹

The Zionists' deliberate and enthusiastic recultivation of a distinctively separate Jewish consciousness stamped them with the authentic hall-mark of Zealotism. Yet these Zionist Neo-Zealots were anathema to diasporan devotees of the Ritualistic Zealot tradition inaugurated by Rabbi Johanan ben Zakkai, in whose eyes the Zionists were guilty of flagrant impiety in presuming to bring about on their own initiative a physical return of the Jewish people to Palestine which it was God's prerogative to accomplish at His own good time according to *Agudath Israel's* hyper-orthodox belief. And, even when the Zionists had partially attained their objective *manu militari*, the Jewish Ritualists' joy at having lived to see the Mosaic Law reconstituted in a reconquered Eretz Israel must have been damped by the observation—to which no sharp-sighted lover of this Law could blind himself—that the Zionists had been moved to re-enact the Torah by the same cynical motive of making religious formalities serve secular purposes as had animated the 'non-Aryan' candidates for Christian baptism.

On the other hand, in the Assimilationist Jews' estimation, the Zionists' Herodian loss of their ancestral Jewish faith was a common experience that did not avail to atone for a Zealot vein in Zionism which, in the Assimilationists' eyes, was deplorably retrograde. The Assimilationists could not bear the Zionists' relapse into their common ancestors' irrational Zealot belief that the Jews were 'a peculiar people'. Yet an orthodox Jewish polemical theologian, or even a neutral Gentile scientific observer, who chose to charge the Zionists with being guilty of the same crime of 'Assimilationism' as those avowed Assimilationists who gloried in the name, would not have found it difficult to secure a conviction.

The truth was that, while the professed Assimilationists were seeking to assimilate themselves individually to their individual Gentile neighbours, the Zionists were unavowedly aiming at the same objective of assimilation in the more radical form of a corporate transformation of the Jewish community into the likeness of 'all the nations'² of a Western or Westernizing World in which a latter-day Jewry found itself living. The Zionist prisoner in the dock would, no doubt, protest that his aim, in parting company with the non-violent Jewish Zealots of Rabbi Johanan ben Zakkai's school, was not to arrive by a better alternative road at the goal of assimilation which was his Liberal Jewish contemporary's Herodian

¹ See II. ii. 252-4.

² 1 Sam. viii. 5 and 20.

objective, but was, on the contrary, to reinvigorate a tame non-violent rendering of the theme of Jewish Zealotism by reverting to the militancy of those Theudas and Judases who had come so promisingly near to success in the glorious years A.D. 66-70, 115-17, and 132-5.¹ But, even if this hypothetical plea of our imaginary Zionist defendant had not been open in A.D. 1952 to being impugned by a damningly odious comparison of it with the speculations of some irreclaimable contemporary German chauvinist on Germany's chances in a third world war, it would have been confuted by the evidence of the historic *sicarii* themselves, if Jewish Zealots of the classical period could have been raised from the dead to be placed in the witness-box by the counsel for the prosecution.

We may be sure that these inexpugnably authoritative witnesses, so far from being grateful to the Zionist in the dock for having cited them as his revered exemplars, would have scornfully dissociated themselves from him after pointing out to the Court that the Zionist's ideology did not vindicate but bewrayed him. In basing the Jewish people's title to the soil of Eretz Israel on the physical ground that they were a master race in virtue of having Abraham for their father,² the Zionist was unwittingly testifying that he had been ensnared by the lure of a post-Modern Western Gentile Racialism in which a Late Modern Western Gentile Nationalism had denounced itself, through the self-exposure of a self-caricature, as being the naked Neo-Paganism that it was. In pursuit of this inveterate Gentile idolatry in the particularly sinister form of Man's self-worship of a human herd, the Zionist Jewish addict to a pagan cult of 'blood and soil' had abandoned his fathers' faith that the Jews were a chosen people in virtue of God's grace in having condescended to make a covenant with Abraham and his seed in which the Lord's choice of Israel was conditional upon Israel's continuing to obey the Lord's commandments. In thus leaving God's will and Israel's conduct out of his reckoning, the Zionist was parting with the spiritual ground which was the only sure basis for the Jews' title to the soil of the Holy Land just because this orthodox version of the traditional Jewish faith compelled the faithful who adhered to it to recognize, with fear and trembling, that their privilege was contingent upon their keeping faith with their Maker and Chooser. What surer way of losing Jewry's title could the Zionists have devised than to deviate, in the blindness of a pagan hybris, into the delusion that a revocable grant from Almighty God was an inalienable birthright automatically transmitted through the physical medium of an Abrahamic blood-stream?

It will be seen that Zionism betrayed its ambivalence by laying itself open to simultaneous charges of Herodianism and Zealotism which, unfortunately for the Zionists, did not cancel one another out.

The psychological reactions in the Islamic World to the aggression of a Late Modern Western Civilization were strikingly reminiscent of the reactions to Hellenic aggression in Jewry during the two centuries ending in A.D. 135.

The insurrections of Jewish militant fanatics embattled on the desert fringes of Palestine against Idumaeen tetrarchs and Roman procurators

¹ See V. v. 68.

² Matt. iii. 9.

who had been invested by Caesar with the stewardship of the former dominions of Herod the Great had their counterpart in the fanatical outbreaks of the Wahhābī, Idrīsī, Mahdist, and Sanūsī Muslim puritans¹ who sallied out of their fastnesses in the Najd, 'Asīr, Kordofan, and the desert hinterland of Cyrenaica on the forlorn hope of overthrowing an Ottoman régime which, in their censorious eyes, had proved itself unworthy of its pretension to be the heir of the Caliphate. As these Islamic Zealots saw it, the Pādishāh had aggravated a heinous first offence of losing the military and political initiative to his infidel Western adversaries by committing the unpardonable second offence of allowing the Ottoman body politic to become a channel for the infection of the heart of Dār-al-Islām with the triumphant infidel's contaminating influence. In this light, nineteenth-century Ottoman sultans and pashas cut the same odious figure as the Herods and Pilates had once cut in the sight of leaders of a Zealot Jewish resistance movement; and the lamentable spectacle of the Theudases and Judases falling suicidally upon devouring Roman swords was duly reproduced in the execution done by Modern Western weapons when the Najdī Wahhābīs were smitten by Ibrāhīm Pasha, the Sudanese Mahdists by Kitchener,² the Libyan Sanūsīs by Graziani,³ and the Maghribī patriot leaders, an 'Abd-al-Qādir in Algeria and an 'Abd-al-Karīm in the Moroccan Rif,⁴ by Bugeaud⁵ and by Boichut. Only the Pathan highlanders⁶ in an East Iranian no-man's-land between a now independent Pakistan and a still independent Afghanistan had succeeded, down to the time of writing, in emulating in a latter-day Dār-al-Islām the Arsacids' and Sasanids' feat of thwarting all Roman attempts to recapture for Hellenism an 'Irāq and a Western Iran that Arsacid arms had salvaged for Zoroastrianism from the Hellenic domination of the Romans' Seleucid predecessors.

These latter-day Islamic reproductions of Zealot Jewish prototypes were balanced, in the same chapter of Islamic history, by avatars of the Herodians' eponymous Idumaeen hero, the great son of Antipater himself, in the titanic Herodian figures of a Mehmed 'Alī Pasha (thrown into relief by his reactionary grandson and successor 'Abbās I), a Sultan Mahmūd II, and a Ghāzi Mustafā Kemāl Atatürk who, in his own lifetime, was successfully imitated in Persia by a Rizā Shāh Pahlawī and was unsuccessfully parodied in Afghanistan by an Amānallāh;⁷ and we have already observed that Rizā Shāh's and Atatürk's radical Herodian reforms⁸ had been anticipated by an abortive Westernizing revolution in Persia in A.D. 1906 and in Turkey in A.D. 1908.⁹

⁸ The imposition of Western dress in Turkey, Persia, and Afghanistan has been noticed in V. vi. 102-3, and the imposition of the Latin Alphabet in Turkey *ibid.*, on pp. 112-13.

⁹ The temporarily successful constitutionalist revolution in Turkey in A.D. 1908 was,

On the other hand the Islamic Society may be credited with originality in having given birth to two nobly tragic martyrs to Herodianism in the persons of an imaginatively prescient Sultan Selim III and a beneficently efficient Midhat Pasha, while the doubtful honour of producing such oddly compounded monsters as Zealot-drones, for which it might be hard to find a precedent in Syriac history, was shared by the Islamic Society with the Russian branch of Orthodox Christendom, where the massacre of the Janissaries by Selim III's cousin and avenger Mahmūd II, and the massacre of the Mamlūks by Mehmed 'Alī, had been anticipated in the massacre of the Streltsy by Peter the Great.

There was, however, a residual tinge of Zealotism even in Mehmed 'Alī's aggressively Herodian *éthos*,¹ and in the writer's day the Islamic World had produced an unmistakably ambivalent culture-hero in the kingly person of an 'Abd-al-'Azīz b. 'Abd-ar-Rahmān Āl Sa'ūd,² the restorer of the fortunes of his house and sect who proved himself a successor of his Wāhhābī Zealot forebears when he purged the Haramayn in the Hijāz of the taint of idolatrous corruption after his conquest and annexation of the Islamic Holy Land, but went on to prove himself also a successor of those same primitive Wāhhābī Zealots' Herodian Ottoman bugbears when he set himself to consolidate the political independence of a salvaged Arabia by coaxing his turbulent and fanatical tribesmen to exchange the nomadic shepherd's leisure for the labours of a sedentary husbandry in oases whose productivity Ibn Sa'ūd did not hesitate to multiply by resorting to the unhallowed Western technique of boring artesian wells. When the Badu had thus been broken in to an Herodian revolution in their way of life, it was less difficult for their Janus-faced patriarch to provide himself with the financial sinews of war or welfare by earning royalties from leases granted, with his now semi-domesticated Badawī subjects' acquiescence, to American *entrepreneurs* who were thirsting to tap the liquid mineral wealth of an Arabian desert's subsoil by probing it, not now for water, but for oil.

In the reaction to the West in the Hindu World the Islamic Zealotism of Wāhhābī, Idrīsī, Mahdist, and Sanūsī puritans had its psychological counterpart in a Zealot revival of an orgiastic Kali-worship and recultivation of a desiccated Vedic lore, while the Brahmans' Zealot-minded anxiety to elude the ritual contamination that they would have incurred through eating and drinking in the company of their British 'fellow

as we have seen, the work of a 'New 'Osmanli' movement which had made its first abortive attempt to turn the Ottoman Empire into a parliamentary constitutional state *alla Franca* as early as the third quarter of the nineteenth century. A recent Western student of this episode of Ottoman history had summed up his appreciation of the policy of Nāmyq Kemāl, one of the leading 'New 'Osmanli' publicists of the pioneer generation, by putting it that 'his aim was to regenerate the state by borrowing from the West the means to oppose to the West a stronger and more united nation' (Davison, R. H.: *Reform in the Ottoman Empire, 1856-1876* (thesis submitted to Harvard University for the degree of Ph.D., 1st April, 1942), p. 241 of the typescript copy in Harvard University Library, quoted here by permission). This sentence puts in a nutshell the objective that is the common goal of all Herodians.

¹ In his *Report on Egypt and Candia* of the 27th March, 1839 (London 1840, Clowes), p. 30, Sir John Bowring records the Egyptians' confident belief that they had now learnt enough from their Frank instructors in Western technique to be able to afford to dispense with their costly services—though, in Bowring's own opinion, experience had proved the contrary (cp. *ibid.*, pp. 48 and 151).

² See V. v. 333-4.

Aryans¹ was amusingly reminiscent of the Pharisees' similar embarrassments in their unavoidable contacts with their uncircumcized Roman lords and masters. Yet these ritualistic scruples did not deter Brahmans from deliberately setting foot within an unclean British lion's den in order to serve the new alien rulers of India as administrators, in the footsteps of those Brahmans of earlier generations who had served the now fallen Muslim predecessors of the British in the same capacity. The British empire-builders' Brahman coadjutors equipped themselves for this Herodian profession of their choice by learning English² with the same industry and virtuosity that their fathers had shown in learning Persian.³

In this post-Mughal phase of the Hindu Society's experience of alien political domination, Brahmans, as well as Kshatriyas, extended the breadth of their front on their Herodian line of march by also taking service in the professional armies, on a Western model, that were raised, in and after the later decades of the eighteenth century, by a variegated pack of Hindu, Muslim, and Western adventurers who were now contending with one another in a competition to carve successor-states out of the carcass of a defunct Timurid Mughal Empire. When a combination of two complementary reductive processes—destruction and absorption—had duly reduced these inchoate Westernizing military forces on Indian ground first to the two surviving military establishments of a British East India Company and a Sikh war-lord Ranjit Singh, and finally to one sole surviving British Indian Army, as a result of a hundred years of costly experimentation in 'the survival of the fittest', this Western-organized, Western-trained, and Western-officered Indian military machine fed by voluntary enlistment kept open a wide vent for Hindu Herodian proclivities—at first mainly among the so-called 'martial races' of the North-West,⁴ but eventually also among Hindus of all castes and quarters whom a Western education had qualified and inspired to become candidates for officer-cadetships in an Indian Army when the cadre of officers was deliberately and rapidly 'Indianized' in the last phase of the British régime. The strength and volume of a Hindu Herodian movement that had been gathering momentum for the best part of two hundred years, as its triple stream swept forward down a military, an

¹ The mirage of a common physical stock to which latter-day Hindus and latter-day Europeans alike could trace back their descent had been conjured up by the unwarranted inference that the existence of 'an Aryan race' was implied in the authentic discovery of an *Ursprache* from which all the latter-day languages of an 'Indo-European' family were genuinely derived. In India under a British Rāj, this mistaken physiological induction from a correct linguistic premiss was not taken sufficiently seriously to move either the Brahman to sit at table with the Englishman or the Englishman to elect the Brahman to membership in his club. It was left for the Nazi fellow countrymen of Bopp to exploit the Aryan racial myth as an instrument of torture for use in their persecution of the Jews long after it had become manifest to scholars that there was little or no correspondence between the family-trees of languages and the genealogies of races. Such a mischievous use does not appear ever to have been made of the analogous legend of a common origin of the Spartans and the Jews that was invented to serve current political purposes in the post-Alexandrine Age of Hellenic history.

² See V. v. 507.

³ The Brahmans' linguistic prowess was the more praiseworthy inasmuch as most of them remained unaware that these graceless alien tongues which they were mastering from a utilitarian motive were akin to the sacred Sanskrit in which they themselves were zealous litterati.

⁴ See II. ii. 128, n. 1.

administrative, and also an industrial channel, was demonstrated in and after the summer of A.D. 1947, when the management of an Indian Union was successfully taken over from British hands by an efficient working party of Hindu statesmen, staff officers, and business men.

In previous contexts attention has been drawn to the ambivalence of the reaction of a Mahatma Gandhi whose conduct of his Zealot campaign for a radical severance of the economic threads implicating the Hindu Society in a Western way of life revealed this Hindu Janus's Herodian counter-face in both the Quaker-minded gentleness and the publicity-conscious efficiency with which the Gandhian political strategy of non-violent non-co-operation was put into action. In this place we have only to make the one further observation that a similar ambivalence revealed itself in the *éthos* of a would-be Zealot Arya Samāj,¹ which, though founded for the purpose of providing a corrective to the Brahmō Samāj's out-and-out Herodianism,² was itself open to the damaging charge that it had derived its own anti-Herodian inspiration from an Herodian sensitiveness to the exotic influence of a Western Romantic Movement.

The psychological reaction to the impact of the Modern West in the main body of Orthodox Christendom has come to our notice in the sullen retreat of a Zealotism that had still been murderously militant when, in A.D. 1638, it had compassed Cyril Loukari's death in retribution for his Herodian crime of Calvinism. Thereafter, the Greek Orthodox hierarchy still showed their teeth in occasional rear-guard actions. Their frustration of Evyénios Voulgcharis' eighteenth-century pioneer educational work advertised their disapproval of Herodianism even when this obnoxious outlook was confined to the intellectual plane, while their subsequent obstruction of the educational activities of nineteenth-century American Protestant missionaries betrayed a perhaps less unreasonable suspicion that in this case an educational programme might have the conversion of souls as its covert ulterior object. Their last losing battle in a Zealot cause was fought in opposition to the plans adopted by an Herodian-minded post-Mahmudian Ottoman Porte for reforming the constitution of the Millet-i-Rûm by giving the laity as well as the clergy a place on its governing body and by introducing into its organization the latter-day Western constitutional devices of representative government by election and of parliamentary control over public finance.

At the same time there was also an Herodian vein in the cultural evolution of an Ottoman Greek Orthodox Christian oligarchy in this age; for, in the course of two hundred years ending in the nineteenth-century last stands of clerical Greek 'die-hards', a ring of Phanariot Greek families³ had secured something like a monopoly of the patronage in the making of appointments to the higher posts in the Orthodox ecclesiastical hierarchy throughout the Ottoman dominions thanks to the wealth and power which these Phanariots had won for themselves by entering the Ottoman public service under unprecedentedly favourable new conditions that had been offered to them since the middle of the seventeenth century; and the professional asset which had purchased for the Phanariots

¹ See V. vi. 94.

² See V. v. 106.

³ See II. ii. 222-8.

from their Ottoman masters these unwontedly attractive terms of employment had been the Herodian familiarity with the languages, manners, and customs of a contemporary schismatic Western Christendom which these Greek Orthodox Christian Brahmans had not disdained to acquire for the sake of the increasingly lucrative profits that they found themselves able to earn by serving as middlemen in the commerce between an Ottoman World and the Occidental 'Children of Hagar'. When these enterprising seventeenth-century and eighteenth-century Greek Orthodox Christian merchants had once set their feet on this Herodian Broadway,¹ it was not surprising that the rank-and-file of a nineteenth-century Ottoman Millet-i-Rûm should have followed the Phanariots' lead to Broadway's terminus by indulging in the more hazardous Herodian conceit of sorting themselves out, in imitation of the Western fashion of the day, into a patchwork of territorially segregated linguistically homogeneous sovereign national states.

In the Russian branch of Orthodox Christendom the psychological reactions to the impact of the Modern West surpassed the contemporary reactions in the main body of Orthodox Christendom in the lengths to which they ran in both directions. In the irreligiously prophetic figure of Peter the Great,² Russia produced the archetype of all the high-handed autocrats who were to impose their Herodianism 'from above downwards' on their fellow creatures in other societies that were likewise confronted with a ubiquitous and inescapable 'Western Question', while in the opposite swing of her psychological pendulum the same Russia reproduced Jewry's uncompromising Pharisees in her Old Believers³ and Jewry's desperate Theudases and Judases in her Cossack

¹ Matt. vii. 13.

² See III. iii. 278-83. Peter's Herodian figure cast its Zealot shadow in the shape of his son, heir, opponent, and victim, Alexei.

³ See V. vi. 120-1. Some two hundred different sects of dissenters (*raskolniki*) were generated (see Mettig, C.: *Die Europäisierung Russlands im 18. Jahrhundert* (Gotha 1913, Perthes), pp. 161-72) in the last chapter of the pre-Petrine phase of Russian history by the liturgical reforms of the Romaicizing Patriarch of Moscow, Nikôn (*pontificali munere fungebatur* A.D. 1652-58 *de facto* and 1652-66 *de jure*). Though the issue over which they had parted company with the officially Orthodox Russian Church of the day was their indignation at an assimilation of current Russian liturgical practice, not to a schismatic Western Roman Catholicism or Protestantism, but to the contemporary Greek version of Russia's own cherished Orthodoxy, many of the dissenting Russian sects eventually also took a Wahhâbi-like stand against Western innovations; and their Zealot puritanism was apt to fasten upon such spiritually neutral 'Yankee notions' as the cultivation of the Italian style of church music and religious painting, the smoking of tobacco, the drinking of tea, and the wearing of Western clothes (*ibid.*, p. 162; Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 281). This Francophobia was common ground between the dissenters and their Nikonite bugbears (see Brückner, *op. cit.*, pp. 96 and 212), and it was particularly violently excited by Western innovations in dress (see the present Study, III. iii. 283, n. 1, and V. vi. 102)—even when these innovations were recognized as being merely what they were, and did not give rise to such horrifying misapprehensions as the mistaking of wig-stands for idols which led, at Astrakhan in A.D. 1705, to an armed insurrection in which the unfortunate bewigged Western officers in Tsar Peter's garrison there were massacred (see Brückner, *op. cit.*, pp. 287 and 289; Sumner, B. H.: *Peter the Great and the Emergence of Russia* (London 1950, English Universities Press), p. 66). This detestation of Western dress was shared with the dissenters by their own detested adversaries the patriarchs. The wearing of Western clothes was forbidden by Nikôn himself (Brückner, *op. cit.*, p. 19), and this ban of Nikôn's was repeated by the Patriarch Joachim (*fungebatur* A.D. 1674-90) in a testament (*redactum* A.D. 1690) in which he also called for the rasing of all churches erected by non-Orthodox Christians on Russian soil as a practical way of acting on his general warning against 'Latins, Lutherans, Calvinists, and Tatars' (Brückner, *op. cit.*, p. 97).

militant Zealots Stenka Razin and Pugachev,¹ whose 'die-hard' deaths put to shame Peter's drone-like Zealot victims the Streltsy.

Even a pre-Petrine Imperial Government that had already taken the first steps to equip itself with Western armaments proved able to inflict on Razin (*erupit* A.D. 1667-71) the fate that was to overtake Pugachev, when he dared to measure his strength against the post-Petrine army of the Empress Catherine, and was likewise to overtake the Wakhābīs when they provoked the Ottoman punitive expedition that was eventually launched against them by Mehmed 'Alī. Yet the Petrine régime of Catherine and her successors, whose flagrant Herodianism stamped them in the Old Believers' eyes with so indubitable a mark of the Beast as to certify their satanic *archégetés* Peter's identity with Antichrist,² harboured a lingering residue of Zealotism which betrayed itself in this régime's ecclesiastical policy towards the Uniate element in the Ukrainian and White Russian population that was reunited with a still aggressively 'holy' Muscovite Russia as a result of the three successive partitions of Poland-Lithuania between the years A.D. 1772 and A.D. 1795. Though in theory the ecclesiastical allegiance of their new subjects ought to have been a matter of studied indifference to an Occidentally enlightened late-eighteenth-century Russian Imperial Government, the statesmen at St. Petersburg nevertheless departed from their professed principle of religious toleration by abusing their political power in compelling the Orthodox Church's Ukrainian and White Russian Uniate lost sheep to return to Orthodoxy by entering a Muscovite ecclesiastical fold—for all the world as if these Voltairian martinets were not quite incredulous of the Orthodox superstition that an ecclesiastical association with the schismatic Western Church of Rome was a murrain from which these infected stragglers from the flock must be decontaminated by being re-dipped in Orthodoxy's sterilizing chrism.

In our gallery of Janus-faced heads, we have long since observed that Lenin's bust has no rival except Gandhi's for the distinction of being labelled as the most perfect specimen in the collection. In the vehemence of their anti-Western Zealotism, even the fifteenth-century Russian Orthodox Christian prelates who led the fanatical Orthodox opposition against the Union of Florence were surpassed by the twentieth-century Russian Communist opponents of a secularist Liberalism which had come to be the prevalent Western ideology of the age; yet the Bolsheviks' Zealot indictment of a contemporary Western way of life was uttered in the name of a Western-made Marxian ideology in obedience to which the Bolsheviks subjected Russia to an Herodian regimen that made Antichrist Peter's Herodianism seem mild by comparison when the Russian soil whose surface Peter's horse-drawn iron-shod plough had turned was cloven to its depths by Stalin's power-driven adamant blade. In this place we have only to add that the nineteenth-century Russian Slavophiles had anticipated the Bolsheviks in their ambivalence by drawing their inspiration for a would-be Zealot criticism of the current

¹ See V. v. 104 and V. vi. 227.

² See Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), pp. 274-9; Sumner, B. H.: *Peter the Great and the Emergence of Russia* (London 1950, English Universities Press), pp. 65-66.

Western way of life from an Herodian acquaintance with a Western Romantic Movement which was likewise to inspire the Zealot-meant gestures of a Hindu Arya Samāj.

A no less equivocal interplay of Zealot and Herodian *motifs* accounts for the fineness of the water of those pearls of literary art that were secreted in a nineteenth-century Russia's morbidly Westernizing body social. The elusive riddle of an Herodian-Zealot Russian literature holds a Western reader fascinated as he finds himself sinking below its seemingly familiar aesthetic surface into the disquietingly alien underworld of its spiritual depths; and this magic is no monopoly of 'the inspired dog' Dostoyevski's mantic genius. It also animates the rarefied atmosphere and subdued colours of the exquisite psychological landscapes painted by the naturalized Parisian Turgenev. We feel it as we admire the masterly portraiture with which, in the character of Bazarov, he creates the Janus-faced archetype of the Bolshevik's forerunner the Nihilist.¹

Our tale of Zealots and Herodians would still be incomplete if we neglected to round up a few stray goats and sheep from Cain's and Abel's meeting-ground on the fringes of the Great Eurasian Steppe. An Herodianism that cost the crypto-Hellenist Scythian Nomad prince Scyles his life at his Zealot tribesmen's hands in the fifth century B.C.² was practised with impunity in the same Great Western Bay of the Steppe in the eighteenth century of the Christian Era by overt converts to Orthodox Christianity among the Lamaistic Mahayanian Calmuck Nomad subjects of a Petrine Russian Empire,³ and likewise by the Sinomane prince of 'Wei' Hiao Wên-ti (*regnabat* A.D. 490-9), though this aggressive Herodian autocrat asked for trouble by going out of his way to impose his policy of Sinification upon his *ci-devant* Nomad To Pa fellow tribesmen in the successor-state which his and their barbarian forebears had carved out for themselves from a defunct Sinic universal state's carcass.⁴ Conversely, we find the lure of the Nomadic life evoking an Herodian response in the heart of an Hellenic representative of the Sedentary World in the fifth century of the Christian Era and in the hearts of Chinese representatives of the same world in the seventeenth century. The renegade Greek captive who had transformed himself into a Hun warrior by the time when he ran into the Constantinopolitan envoy Priscus in Attila's camp was matched, as we have seen,⁵ by Chinese settlers who transformed themselves into Manchu 'bannermen' in Southern Manchuria. In the gamut of the husbandman's and business man's psychological reactions to the impact of Eurasian shepherd-kings, these two instances of a thorough-going Scythophil Herodianism have their antitheses in two outbreaks of a Scythophobe Zealotism that went to no less extreme lengths. The Zealot reaction which threw the Mongols out of a conquered China in the fourteenth century of the Christian Era⁶

¹ The 'Nihilism' which in Russia was a premonitory symptom of the characteristic malady of an intelligentsia has been noticed in V. v. 157. A sensitive appreciation of this phenomenon will be found in Weidlé, W.: *La Russie Absente et Présente* (Paris 1949, Gallimard), pp. 119-21.

² See II. ii. 372, n. 3; III. iii. 281, n. 2, and 429, n. 1.

⁴ See V. v. 477-8.

⁵ In V. v. 409-10.

³ See III. iii. 429, n. 1.

⁶ See V. v. 348-51.

had been anticipated in the sixteenth century B.C. by a Zealot reaction of a no less demonic vehemence which had thrown the Hyksos out of a conquered Lower Egypt.¹

These antithetical 'Zealot' and 'Herodian' types of psychological reaction which we have found declaring themselves so conspicuously in encounters between contemporary representatives of different civilizations may also be expected, in virtue of the psychic uniformity of Human Nature, to be discernible and identifiable in other encounters in which the parties represent, not different civilizations, but merely different communities within a single world, or different individuals within a single community; and, before we bring this survey to a close, it may be as well to put this *a priori* expectation to at least one empirical test.

After the schism between the Catholic core of a Western Christendom and the Protestant flake that split off from it in the Early Modern chapter of Western history, there were characteristic manifestations of both Zealotism and Herodianism in the psychological reactions of the Catholic party to this Western family quarrel.

We can trace the Zealot vein in the ecclesiastical sphere in a cult of Papal autocracy, as an end in itself, which was inaugurated at the Council of Constance (*sedebat* A.D. 1414-18) by Pope Martin V² and was carried to its climax at the Vatican Council (*sedebat* A.D. 1869-70) by Pope Pius IX.³ The same rise of emotional temperature in a Zealot furnace can be read on the gauge of ecclesiastical discipline in the difference between the relentless severity of a Spanish Inquisition and the relative mildness with which the repression of heresy had been conducted by the Roman Church before the Spanish Inquisition had come to dominate this field of Catholic action, while, in the intellectual field, we can observe a comparable difference between the Vatican's Herodian open-mindedness towards a fifteenth-century Italian Renaissance of Hellenism and the obscurantism of its resistance to a seventeenth-century indigenous Western scientific revolution.⁴ On the political plane, too, this Zealot vein in the Modern Western Catholic Christian reaction to the challenge of Protestantism declared itself in the Spanish Crown's attempt to insulate its Empire of the Indies by immuring this hermit kingdom behind a wooden wall of Castilian sea-power.

On the other hand we see Herodianism asserting itself in a Late Modern Catholic social environment in the tacit relaxation, in an eighteenth-century Italy, of the seventeenth-century Papal ban on an empirical study of Physical Science without regard for the authority of Holy Church's doctor of secular theology, Saint Aristotle, while, in a France where Protestantism had been suppressed by Counter-Reformatory zeal, we see an Herodian crypto-Protestant-mindedness reasserting itself in the successive guises of an abortive Augustinian Jansenism and of a triumphant rationalist agnosticism which followed up its conquest of France by eventually conquering all the Catholic as well as Protestant

¹ See V. v. 351-2.

² See IV. iv. 573-4.

³ See IV. iv. 638.

⁴ This scientific revolution was not only a new departure; it was a move in a different direction from that of the foregoing Renaissance of Hellenic culture (see the passage quoted from Herbert Butterfield, *The Origins of Modern Western Science, 1300-1800*, in X. ix. 67-68).

provinces of a Late Modern Western World.¹ In a French Revolution in which the ideas of the eighteenth-century French rationalist philosophers went into action on the political plane, a *ci-devant* Catholic France adopted from her *ci-devant* Protestant neighbours, Great Britain and the United States, the modernized Medieval Western institution of a parliamentary national state; and, in this elegantly rounded French version,² an unattractively angular Anglo-Saxon political attitude was eventually adopted—at least in outward show—even by such old-fashioned Catholic countries as Spain, Portugal, the Latin-American successor-states of the Spanish and Portuguese Empires, and a *gleichgeschaltet* Kingdom of the Two Sicilies.

The Zealot vein in the Catholic reaction to the eruption of Protestantism in the Modern Western World had its counterpart in the contemporary Zealotism of the Safawī Qyzylbash devotees³ whose swords achieved the trowel's work of building a new city of refuge, in the heart of an encompassing and indignant Sunnī Iranic Muslim World, for a long repressed and scattered Shī'ah, while the antithetical Herodian vein can be detected in Nādir Shāh's unsuccessful attempt⁴ to redirect a latter-day Shī'ī Persia into the Sunnah's beaten track.

A Meeting of Extremes

If we now proceed to take stock of the impressions left on our minds by the spectacle that we have just been watching, we may find that these impressions are confused and that our minds are correspondingly bewildered. As we took the salute from the mixed force under review, the Zealot and the Herodian components of these motley troops both made a parade, as they presented arms in passing the saluting point, of the distinguishing marks blazoned on their respective accoutrements. In the conspicuousness of these badges and the emphasis of these gestures alike, they were insisting with one accord upon their diversity from one another; yet this unanimous assertion of theirs was being contradicted all the time by the evidence of our own observant eyes; for the most striking of all the impressions made upon us was our observation—as frequently repeated as it was perpetually surprising—that the classical examples of either one of the two types turned out, as often as not, to be also classical examples of the other type of soldier under arms for the defence of an assaulted society.

The list of these Janus-figures that we have been jotting down so assiduously turns out, on inspection, to be a veritable roll of celebrities. It includes King Mithradates Eupator; the Sicel patriot Ducetius; the Sheykh Bedr-ed-Dīn of Simān; Guru Nanak the founder of the Sikh Church (who had a likewise Janus-faced forerunner in the poet-prophet Kabīr);⁵ all the Japanese statesmen who had been wrestling with the

¹ See X. ix. 304-5.

² The role of France in Late Modern Western history as an interpreter of English ideas which were peptonized by being 'processed' in a French mill has been noticed in III. iii. 369-71; IV. iv. 200, n. 1; and on p. 517, above.

³ See I. i. 366-7 and V. v. 661-5.

⁵ See IV. iv. 231; V. v. 106, 537, and 668.

⁴ See I. i. 399.

Western Question for the past four hundred years; Hung Hsiu-ch'uan, the father of the T'ai'ping movement in a nineteenth-century China, and the twentieth-century Chinese apostles of Communism; the authors of the revolution in Mexico that broke out in A.D. 1910; 'the Horse Indians' on the Great Plains of North America; the Zionists; King 'Abd-al-'Aziz Āl Sa'ūd; the Arya Samāj; Mahatma Gandhi; the Slavophiles; the Bolsheviks; and the creators of a nineteenth-century Russian literature. This dubious array of caprine Zealot sheep and ovine Herodian goats may well make us sceptical of the authenticity of either of the two *soi-disant* diverse breeds that are both alike represented in the ambiguous physiognomy of each of these Protean creatures; and we may be moved to ask: Then were those contradictory-sounding Zealot and Herodian slogans 'Antichrist!' and 'Die-hard!' insincerely rhetorical exclamations? And was that dumb-show of mutual antipathy and opposition a sly piece of play-acting in which the actors were in collusion to deceive us?

Our Zealot and Herodian demonstrators' now suspect sincerity can hardly be vindicated unless the alleged antithesis between their two ideologies, which both schools unanimously call upon us to recognize, proves to be guaranteed by some objective distinguishing mark in the nature of a finger-print or a shibboleth; but none of the marks borne by the representatives of either party will prove, on examination, to be either party's distinctive livery.

There is, for example, a distinction, empirically traceable in our foregoing survey, between movements from above downwards and movements from below upwards; and, if we were to make our first test of this possible differentia between Zealots and Herodians by applying it to the classic case that we have taken as our prototype, a first glance at the relations between Herod the Great and the Jewish Zealots of his day might tempt us to jump to the conclusion that Herodianism could be distinguished from Zealotism as a policy imposed from above downwards on a passion surging up from below.

This criterion might seem accurately to distinguish a common characteristic of Herod and his forerunner Joshua-Jason from a common characteristic of the Maccabees and the Pharisees. It might also appear to hold good as between Herod's Hellenizing patrician contemporaries and counterparts in the Philistine and Phoenician city-states and their anti-Hellenic kinsmen the insurgent Syrian slaves in Sicily; and, again, as between an insurgent Egyptian peasantry and the Egyptian notables in the *métropoleis* of the nomes who proclaimed themselves philhellenes by enrolling themselves as gymnasiasts. A latter-day series of anti-Hellenic Zealot movements flying religious colours—a Nestorian and a Monophysite Christianity and a more militantly Zealot Islam—all also duly respond to our test by patently revealing themselves to be eruptions from below upwards. Our criterion fails us, however, when we apply the same test to Zoroastrianism; for here we find an anti-Hellenic Zealot movement—likewise flying religious colours—that did not erupt from below upwards but was, on the contrary, imposed from above downwards by Zealot-minded Arsacid and Sasanid autocrats who 'established'

a Zoroastrian Church as the official religious organization in their dominions. And, if this Zoroastrian Zealot movement from above downwards thus proves recalcitrant to our test, we shall find our tentative criterion doubly discredited when we light upon the inverse intractable phenomenon of an Herodian movement from below upwards. Yet we are bound thus to characterize the peaceful penetration of the upper levels of the Hellenic Society by freedmen successors of insurgent slaves who had failed to throw off an Hellenic yoke, and by latter-day missionaries of Cybele-worship, Isis-worship, Mithraism, and Manichaeism who commended their Oriental religious wares to an Hellenic public by putting them into an Hellenic dress.

If we pass from the field of the encounter between Hellenism and its contemporaries to the other plots on our map, we shall meet with the same experience. In an encounter between a nascent Western Christendom and the Scandinavians, an Herodian response in the Scandinavian World to the Western Christian challenge duly took the form of a movement from above downwards in the kingdoms of Denmark, Norway, and Sweden, but could not take effect otherwise than from below upwards in the anarchic political environment of Iceland. In the encounter between a Medieval Western Christendom and a Russian Orthodox Christendom, again, our criterion holds good as between the Hanseaticizing patrician Herodians in the city-state of Novgorod, or the Polonizing Ukrainian and White Russian nobles in the kingdoms of Poland and Lithuania, and the anti-Uniate Zealot Ukrainian and White Russian Orthodox Christian subjects of the Polish and Lithuanian Crowns. But what are we to make of the Ukrainian and White Russian Uniates? Are we not confronted here with an Herodian movement rising from below upwards? And what of those Muscovite autocrats who patronized the Orthodox Christian Church? Are they not unmistakable counterparts of the Zealot Arsacid and Sasanid patrons of Zoroastrianism? And does not this affinity identify them for us as being likewise Zealots working from above downwards?

The farther we proceed, the more frequently our tentative criterion fails us. The Phanariot and Brahman ministers of Muslim empire-builders, who were Herodians duly transmitting the adopted language, dress, and other external insignia of an alien Muslim culture to the lower castes of their societies from above downwards, are counterbalanced by members of those very lower orders who propagated the same Herodian movement from below upwards in the more radical act of becoming converts to Islam. In a Far Eastern World under pressure from the Modern West, an Herodianism duly working from above downwards at the Chinese Imperial Court under the Ming and Manchu régimes and in the Meiji Revolution in Japan is counterbalanced by the spectacle of a Zealotism likewise working from above downwards in Japan under the Tokugawa régime and returning to the charge in the same direction, even after the Meiji Revolution, in the subsequent establishment of Neo-Shintō as a state religion, while in the same Far Eastern World the reactions to Western pressure that come up from below are more frequently Herodian than Zealot in character. The Zealot eruption of the

Boxers is counterbalanced here by the Herodianism of the seventeenth-century Japanese and eighteenth-century Chinese Catholic Christian martyrs; and similar well-springs of Herodianism rising from below can be detected in the subterranean heroism of Japanese crypto-Christians and secret students of Western learning in defiance of the Bakufu, in the recrudescence of conversions to Christianity in nineteenth-century Japan and China alike, and in the emergence of the Kuomintang. In the submerged indigenous societies in the Americas the aristocratic Herodianism of a Garcilaso de La Vega is counterbalanced by the Herodian mass-conversions of Andean, Paraguayan, and Mexican peasantries to a Tridentine Roman Catholic Christianity.

If we go on to apply our test to the encounter between the Modern West and the Islamic World, we shall find it at first sight appearing to answer better here. An Herodianism imposing itself from above downwards is represented by antitypes of King Herod the Great in the persons of Sultans Selīm III and Mahmūd II,¹ Mehmed 'Alī Pasha and Midhat Pasha, President Mustafā Kemāl Atatürk, Rizā Shāh Pahlawī, and King Amānallāh; and this imposing array of Herodian statesmen operating from above is confronted by a no less imposing array of Zealot insurgents erupting from below: the explosive Wāhhābī, Idrīsī, Mahdist, and Sanūsī fanatics on the Afrasian Steppe; the romantic patriots 'Abd-al-Qādir and 'Abd-al-Karīm in the Maghrib; the untamed Pathan barbarians in the highlands of Eastern Iran. Yet here, too, we find phenomena that do not conform to our experimental pattern; for those 'Zealot-drones' the Janissaries and Mamlūks were incubuses weighing upon Society from above, not jacks-in-the-box bursting the lid by springing up from below.

In the Hindu Society's reactions to the Modern West the downward-working Herodianism of a British Serkār's Brahman clerks and the upward-working Zealotism of a resurgent Kali-worship and a Neo-Vedism conform to our test only to be offset by the anomalously upward-working Herodianism of a British Indian Army's recruits and a Brahmō Samāj's converts. In a latter-day Ottoman Orthodox Christendom the Herodianism *de haut en bas* displayed by Westernizing Phanariot Ottoman Ministers of State is offset by the Zealotism *de haut en bas* of an anti-schismatic Phanariot Orthodox Christian hierarchy, while Greek, Serb, Bulgar, and Ruman nationalists *alla Franca* anticipate a Chinese Kuomintang in propagating Herodianism from below upwards. In Russia the classic contrast between Peter the Great's Herodianism from above downwards and the Zealotism from below upwards displayed by obstinate Old Believers and explosive Cossack insurgents is blurred by the anomalous spectacle of a Zealotism from above downwards which reasserted itself in the repression of Ukrainian and White Russian Uniatism by an eighteenth-century Petrine Russian Imperial Government after Peter the Great had crushed an earlier manifestation of the

¹ 'Reform in Turkey, as in Russia (until the mid-nineteenth century), came from above, because the rulers were more revolutionary than their conservative subjects' (Bailey, F. E.: *British Policy and the Turkish Reform Movement: A Study in Anglo-Turkish Relations, 1826-1853* (Cambridge, Mass. 1942, Harvard University Press), p. 223).

same anomalous phenomenon of a Zealotism in high places in the act of ridding Russia of the incubus of those Zealot-drones the Streltsy.

In the encounters between Cain and Abel along the borderline between the Desert and the Sown the Herodianism from above downwards practised by Scythian, Calmuck, and To Pa khans who cultivated the Sedentary World's alien way of life within the shelter of city walls, and the Zealotism from below upwards that was displayed by the sedentary subjects of Eurasian Nomad empire-builders in demonic revolts against hated alien masters, are counterbalanced by a Zealotism from above downwards through which these harshly oppressive sons of Abel incurred their sedentary subjects' implacable hatred, and by the Herodianism from below upwards that moved Greek and Chinese renegades from the ranks of a sedentary society to take service in the armies of Hun and Manchu Nomad invaders of the fields and cities of the Children of Cain.

When we glance, in conclusion, at our two instances of encounters between two conflicting ideals within the bosom of a single society, we shall find our tentative identifications of Zealotism with movements from below upwards and of Herodianism with movements from above downwards only partially corresponding with the facts here likewise. In the encounter between a resurgent Shi'ah and an encompassing Sunni World, Zealotism, it is true, duly erupts from below in the explosion of Ismā'il Shah Safawī's Qyzybashys, while Herodianism likewise conforms to pattern by emanating from above downwards in Nādir Shāh's unsuccessful attempt to undo Shah Ismā'il's work by an exercise of his own autocratic power. On the other hand, in the history of the psychological reactions of a Tridentine Roman Catholic Church that had been thrown on to the defensive by the shock of the Protestant Reformation, the Vatican's eighteenth-century latitudinarianism *vis-à-vis* a Late Modern Western scientific revolution was an exhibition of Herodianism from above downwards that was as exceptional as it was belated. The Vatican's characteristic reaction was the Zealotism from above downwards exhibited in a burning of Giordano Bruno which was one of the sensational sequels to the Spanish Inquisition's investiture with the supreme command in the Roman Church's perennial holy war against heresy; and the same Zealot spirit moved the Papacy, from the pontificate of Martin V to the pontificate of Pius IX, persistently to subordinate other considerations to the obsessive over-riding aim of preserving and augmenting its own autocratic control over the Roman Church's government. Conversely, the most impressive manifestation of Herodianism in this domestic scene in Western Christendom's modern life was a crypto-Protestant movement which had rocketed up from below—driven aloft, like a jet-plane, by the successive explosions of Jansenism, Voltairianism, and Jacobinism.

Now that an empirically observed difference between movements rising from below upwards and movements descending from above downwards has proved, on trial, not to furnish us with a satisfactory criterion for distinguishing Zealots and Herodians from one another, let us see whether a likewise empirically observed difference between violent and gentle responses to challenges will serve our purpose any better.

A priori this might seem improbable, since our study of schism in the body social,¹ which was the context in which this antithesis between the spirits of Violence and Gentleness first came to our notice, has shown us both spirits manifesting themselves indiscriminately in the responses of Proletariat and Dominant Minority alike to the challenge of disintegration. Yet, if we apply this criterion in turn to our prototype case, at first sight it does seem to be valid, as we register the contrast in temper between Zealot Theudas and Judases, who were spoiling for a fight with Roman masters of the World, and a Herod who earned his title to be acclaimed as great in statesmanship by his determination to restrain his ineptly fanatical Jewish subjects from indulging their mad impulse to challenge Rome's omnipotence. On this showing, we might tentatively identify Zealotism with the violent and Herodianism with the non-violent vein in an assaulted society's feeling towards its alien assailant; but these provisional identifications also will not stand the test of further confrontation with the facts.

In the classic case in point, for instance, a suggestion that Herod's studious appeasement of Rome certified this appeaser to be a man of peace would have been received with bitterly derisive laughter by *sicarii* whose childish schemes for resorting to violence against Herod's Roman overlords had been anticipated by the better calculated violence with which Herod had nipped such 'dangerous thoughts' in the bud. We have lighted here upon a political dilemma that faces every Herodian potentate. The stronger his conviction of the necessity of coming to terms with an alien civilization of decisively superior potency, the greater will be his sense of the urgency of insisting that his subjects shall fall in with his policy; and, if this policy is ever placed in jeopardy of being frustrated by violent manifestations of Zealotism on their side, he will deem it the lesser evil to meet violence with violence in his struggle to save his Herodian statesmanship from being frustrated by the Zealots in his own household, rather than to shrink from repressing these wild men by force at the cost of allowing them to sweep him into a desperate insurrection against a paramount alien Power. He can take no other line if he is not to be untrue to himself, for the penalty of capitulation to the Zealots would be not merely the negation of the weakling ruler's own Herodian policy; it would also be the death of the community for whose welfare he is politically responsible.

Our prototype-episode also brings to light another point in which our tentative equations of Herodianism with Gentleness and of Zealotism with Violence both break down. Any Herodian statesman who is in earnest will be concerned not only to save his policy from being sabotaged by Zealot violence but also to ensure that it shall not be frustrated by Zealot passive resistance.² A lively awareness of this second, more insidious, danger in Herod's lucid mind gave his ruthless will the signal to chastise awkward Pharisees³ as well as froward *sicarii*; and the states-

¹ In V. v. 35-376.

² The non-violent vein in the Zealot Jewish opposition to a post-Alexandrine Hellenism has been noticed in V. v. 72-73.

³ The *ethos* of the Pharisees has been noticed in V. v. 73, n. 4.

manlike consistency with which Herod thus meted out chastisement to Pharisees and *sicarii* alike will remind us that Zealots are no more invariably violent than Herodians are invariably gentle. In the encounter between a post-Alexandrine Hellenism and its Oriental contemporaries the violent Zealotism inherited by the Jewish *sicarii* from Maccabee fore-runners and likewise displayed in the Maccabaeon Age by insurgent peasants in Egypt and plantation-slaves in Sicily—not to speak of the latter-day violence of Zoroastrian Sasanidae and of Primitive Muslim Arabs who gave a by then senile Hellenic ‘ascendancy’ its *coup de grâce*—divided the allegiance of Zealotism’s devotees with the gentle fanaticism of the Pharisees, Rabbi Johanan ben Zakkai, and the Nestorian and Monophysite Christian Hellenophobes, while, on the other side, Herod the Great was not the only Herodian reagent to the impact of Hellenism who was drawn into using violence by the exigencies of a policy of appeasement. This statesman’s dilemma, which did not beset the non-violently Herodian Egyptian gymnasiasts, freedmen *novi homines*, and missionaries of Cybele-worship, Isis-worship, Mithraism, and Manichaeism, inexorably led other Oriental client princes besides the Herods into taking repressive measures against their own subjects in pursuance of a pacific policy *vis-à-vis* the Roman Imperial Government which invested these appeasers, in their victims’ eyes, with all the Satanic attributes of the powers of darkness.

Our classic test case of the encounter between a post-Alexandrine Hellenism and its Oriental contemporaries thus indicates that an empirically observed distinction between veins of Violence and Gentleness does not, in fact, provide us with an objective differentia for distinguishing between Zealots and Herodians; and this indication will be confirmed by an extension of our field of vision.

The Hellenic spectacle of a Herod the Great being drawn into a domestic policy of repression in defence of a foreign policy of appeasement is reproduced in the political careers of Herodian potentates in the histories of other encounters between the representatives of conflicting cultures. This was likewise the tragic destiny of the Varangian war-lord Vladímir the Great,¹ the Norwegian King Ólaf Tryggvason,² the Kuomintang Government of a Chinese Republic, Mehmed ‘Alí Pasha, Sultan Mahmūd II, President Mustafā Kemāl Atatürk, Rizā Shāh Pahlawī, King Amānallāh of Afghanistan, the leaders of Greek, Serb, Bulgar, and Ruman Orthodox Christian militant nationalist movements, Tsar Peter the Great,³ the Sinomane To Pa Prince Hiao Wên-ti, Nādir Shāh, and a Jacobin Committee of Public Safety that set up a Reign of Terror in a Revolutionary Paris.

The successfully violent Herodian potentates in this catalogue of successes and failures would have sought to justify their crimes by insisting that it was not only better to succeed like a Vladímir and an Atatürk than

¹ See II. ii. 352.

² See *ibid.*

³ Peter was a believer in the use of violence in dealing with his Zealot-minded subjects, not merely for the negative purpose of suppressing revolts against his policy of Westernization, but also for the positive purposes of forcing down their throats a Western system of education and a Western industrial technique (see Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), pp. 514–16).

to fail like an Olaf and an Amānallāh, but was also better to make even an unsuccessful attempt than to show oneself, like Selīm III, 'too proud to fight',¹ or to make, like Scyles, a futilely craven attempt to evade an unescapable issue, or to be manœuvred, like Midhat, into 'missing the bus'.² And these impenitently high-handed Herodian advocates of force who had been rewarded by success for having the courage of their convictions would not have accepted Selīm's Frankish historical adviser's plea that this 'Osmanli Herodian's Norman counterpart Rollo had been able to induce his Scandinavian warriors to follow his Herodian lead without having to take them by the scruff of the neck, or Scyles' shaman *clairvoyant's* plea that Scyles' bloodily terminated crypto-Hellenic life within the walls of Borysthene had been justified posthumously by his latter-day Calmuck counterparts' adroitness in 'getting by' with their conversion to a Petrine Russian Orthodox Christian culture within the precincts of Stavropol. The triumphantly violent champions of Herodianism would have dismissed this Calmuck and this Norman episode as being exceptions which proved their own robust rule, and they would have despised the tolerantly latitudinarian Popes of an eighteenth-century school as traitors to the august office whose traditional prerogatives these Laodiceans were thus permitting to go by default. Nor would the red-handed Herodians have been impressed by non-violent Phanariot ministers of an Ottoman Porte or non-violent Brahman ministers of a Mughal and a British Rāj; for they would have pointed out that these Herodian-minded civil servants were non-violent by necessity and not by choice, since their masters always withheld from them the exercise of the power of the sword.

If, in the teeth of these testimonies and arguments, we still sought to vindicate our tentative identification of Herodianism with Non-Violence, we could, of course, present a counter-list of non-violent Herodians, including the nineteenth-century Jewish Assimilationists in the Western World; the whole of the Jewish diaspora—and all other diasporas at all times in all places—on the economic plane; the Andean and the Mexican converts to a Roman Catholic Christianity, ranging from the aristocrat Garcilaso de la Vega to the primitive Guaranís; the Japanese and Chinese converts to the same religious faith who died for it as martyrs or lived for it in the catacombs; the Japanese pagan martyrs who paid with their lives for their secret study of a secular Late Modern Western Science; and the Jansenist and Voltairian apostles of a Modern Western *Weltanschauung* who waged their 'cold war' of aggression against an apprehensively Zealot-minded Tridentine Roman Catholicism with the Orphic weapon of propaganda. This list, however, would remain inconclusive even if it could be lengthened *ad infinitum*; for, if once we have conceded that Herodianism is apt to find itself drawn into violence by the exigencies of its own aims when its exponents are political potentates, we have implicitly conceded that the spirit of Non-Violence cannot be a distinctive characteristic of the Herodian ethos.

¹ Woodrow Wilson on the 10th May, 1915.

² Neville Chamberlain on the 5th April, 1940, referring to Hitler, who was to make Chamberlain's taunt recoil on its author's own head before the month was out.

Conversely, we shall find, if we complete our application of this test to our array of exponents of Zealotism, that the Oriental Zealot reactions against a post-Alexandrine Hellenism are not peculiar in displaying non-violent as well as violent manifestations. The split in Jewish Zealot ranks between *sicarii* and Pharisees, and in servile Zealot ranks between slave insurgents and freedmen *arrivistes*, is reproduced in a Russian Orthodox Christendom in the split between the violence of Stenka Razin or Pugachev and the non-violence of the Old Believers, and in an Ottoman Orthodox Christendom in the contrast between the martial spirit of Maniot and Montenegrin wild highlanders and the tameness of a conservative-minded Greek Orthodox hierarchy. On the northern fringes of a submerged Central American World the same parting of the ways is proclaimed in the piquant juxtaposition of pugnaciously Zealot 'Horse Indians' and pacifically Zealot Pueblos; and the hunter peoples of North America who were engulfed by a tidal wave of immigration from the Old World, that was rolling westwards, with irresistible force, from the Atlantic seaboard of the United States, were likewise divided between pacifists and believers in resistance. If we apply the same test to the Jewish diaspora in the Western World, we find here, of course, that the non-violent Zealotism of the Ritualist disciples of Rabbi Johanan ben Zakkai had been a far older and far more widespread response to the challenge of an encompassing alien culture than the recrudescence of the spirit of the *sicarii* among a rabid minority of the Zionist settlers in Palestine.

These instances suffice to demonstrate conclusively that Violence is no more characteristic of Zealotism than Gentleness is; and this inference cannot be cancelled by citing other instances in which the men of violence in the Zealot ranks do not appear to be counterbalanced by the presence of any men of peace. It might be difficult, for example, to cite any non-violent Islamic Zealots to neutralize the cumulative impression made on an observer's mind by the militancy of Wahhābīs, Idrīsīs, Mahdists, Sanūsīs, Pathans, and Maghribīs, whose retort to Frankish honey-thieves was to burst furiously out of their plundered hive like bees eager to give their lives for the sake of lodging their stings in an insufferable aggressor's flesh. In the Far Eastern World, again, the violent Zealotism of the Ming, the Tokugawa, and the Boxers appears to hold the field unchallenged by the contrary example of any alternative non-violent school. Yet these obvious exceptions will not avail to rehabilitate a decisively discredited rule.

Perhaps the clearest proof that Violence is no distinctively Zealot spirit is presented by the spectacle of the professional soldiers' impartially indiscriminate distribution of their forces, of both higher and lower quality, between the Zealot and Herodian camps. The most highly distinguished of the professional soldiers begotten from encounters between diverse civilizations had, indeed, been Herodians and not Zealots. Peter the Great, Nādir Shāh, Mehmed 'Alī, Mustafā Kemāl Atatürk, and Rizā Shāh Pahlawī were conspicuous representatives of the Herodian category. By contrast, the most conspicuous professional soldiers whom we have come across in the Zealot hive are the discredibly

drone-like latter-day Streltsy, Mamlûks, and Janissaries. To find Zealot professional soldiers worthy to compare with the most eminent of their Herodian brothers-in-arms, we must call up those stalwart Illyrian soldier-emperors¹ who showed their mettle in leading the last counter-attack of a demoralized Hellenism against a triumphant Christianity, and those indomitable Spartiate 'Peers'² who defended, with their backs to the wall, 'the peculiar institution' of a culturally dissident Hellenic city-state which had deliberately parted company with the main body of the Hellenic Society in order to march straight into a spiritual desert of Militarism at the very moment when the rest of Hellas was emerging out of darkness into light. Yet the height of heroism to which a Spartiate Leonidas rose gives the measure of the depth of demoralization to which his nephew Pausanias sank; and, moreover, if we expand the Zealot contingent in our muster of professional soldiers by bringing up reinforcements that are of dubious quality, we shall be bound, in equity, to dilute the Herodian contingent likewise by calling up those barbarian mercenaries who had been enlisted in the professional military defence of Civilization on the anti-barbarian frontiers of so many oecumenical empires.³

Our now manifest failure in our repeated search for a valid criterion for distinguishing Zealots and Herodians from one another suggests that this quest may be a wild goose chase and prompts us to make a fresh attack on our problem from a different quarter. Instead of taking as our point of departure a professed antithesis and antagonism for which we have no better evidence than the two parties' own concordant, but perhaps collusive, protestations, let us take the Janus-faced ambivalence of many of the most impressive of the soldiers on parade, which is a fact open to observation by the spectator with his own unprejudiced eyes, in the teeth of the troops' unsupported and perhaps not disinterested assertions. If we now remind ourselves of the nature of the emergency that has brought both Zealots and Herodians into action, we shall see that this ambivalent appearance, so far from being surprising, is actually just what we should expect. For both parties alike are engaged in the desperate enterprise of counter-attacking an alien enemy force that has lodged itself within the gates of their assaulted city. The common objective of both the Zealot and the Herodian defenders of their common home is to retrieve this perilous situation; and, in so far as they may be taking different lines, these are merely different tactical approaches to an identical strategic objective.

Moreover, it is manifest that neither warrior can hope to achieve a common practical purpose if he insists on pushing his own tactical theory to the extremity of its logical conclusions. A Coroebus, accoutred in the arms of a fallen foeman,⁴ who carried his *ruse de guerre* to the point of falling in, shoulder to shoulder, with his slain adversary's combatant comrades in the enemy assaulting column, would be reducing his Herodianism *ad absurdum* by assisting in the capture of a Troy that he had taken up arms to save from falling; and in real life we do not

¹ See V. vi. 207.

² See III. iii. 50-79.

³ See V. v. 461-6, and pp. 40-41, above. ⁴ Virgil: *Aeneid*, Book II, ll. 383-401.

find historical instances of Herodians thus stultifying themselves by a suicidal self-caricature. Even those Herodian potentates who have gone farthest in imposing an aggressive enemy civilization's culture on their subjects on the technological, economic, social, and intellectual planes have usually gone to these unwelcome lengths with the object of thereby preserving intact at least the continuity and independence of the commonwealth for whose government they have been responsible, while non-violent Herodians whose policy has not been dictated to them by any political responsibilities have usually been aiming at the preservation of some other element in their own assaulted cultural heritage—for instance, an ancestral religion or, at a minimum, the bare memory of the submerged society's former existence through the registration of an entry, such as Garcilaso de la Vega made, in the records of the victorious aggressor society by whose act the victim society has been sent to join the shades in Sheol.

On the other side of an imaginary line dividing an Herodian from a Zealot track, those devoted Jewish and Red Indian violent Zealots whose scruples have inhibited them from carrying on their 'holy war' on the Sabbath Day¹ or from conducting it with the White Man's weapons² have condemned their own cause to defeat by these sublimely unpractical sacrifices on the altar of superstition. By contrast, every practical-minded Zealot has made concessions to Herodianism, while every practical-minded Herodian has seasoned his own Laodicean philosophy with a grain of Zealot salt. On this showing, the Zealot and Herodian standpoints look, not so much like two isolated peaks sundered by an impassable gulf, as like the upper and lower ranges of the gamut of a musical instrument in which the interval between this instrument's two acoustical extremes is bridged by a continuous gradation of intermediate notes, and on which the highest and lowest notes of all are seldom or never struck by any player who is an even barely competent performer.

Thus a Zealot who has the common sense and the strength of mind to refuse to bring his principle to grief by being guilty of a suicidally pedantic loyalty to it will find himself perforce stepping one pace forward from his own bridgehead on to the bridge that spans the gulf between his own and his Herodian twin brother's standpoint; but 'la distance n'y fait rien; il n'y a que le premier pas qui coûte';³ and, when once this first step has been taken, the insidiously potent law that 'one thing leads to another' will guide our Zealot pilgrim's feet into the way, not of peace,⁴ but of progressive compromise, until it has carried him, *pedetemptim et gradatim*,⁵ right over the keystone of Chinvat's arch on to the approaches towards an Herodian bridgehead on the farther side of an insensibly traversed intervening space.

This self-defeat of Zealotism in its tug-of-war with Herodianism on a

⁴ Luke i. 79.

⁵ Cicero: *Ad Familiares*, Book IX, Letter xiv, § 7.

hazardous pitch dizzily overhanging a deadly gulf calls up an image that has haunted our imagination once before. We have had a pre-view of this play in looking on at the awesomely ironic pageant of the self-defeat of Archaism,¹ and in seeing this dumb show translated into a play in which the dramatis personae have all been divers impersonations of a Protean 'saviour with the time-machine'.² In the plot of that psychological drama the way in which Archaism defeats itself is by passing over into Futurism; and we can now see that Zealotism is the psychological equivalent of Archaism, and Herodianism of Futurism, in a situation in which the internal challenge of social disintegration has been replaced—or reinforced—by the external challenge of an alien enemy within the gates of the challenged society's cultural citadel.

Nor is this the only memory of previous intuitions that we recollect, as the spectacle of the metamorphosis of Zealotism into Herodianism passes before our eyes. The examples, cited at the close of our foregoing survey, of psychological reactions along recognizably Zealot and Herodian lines in the domestic histories of civilizations are reminders that we have also already come across other equivalents of Zealotism and Herodianism in studying the intractability of institutions in the course of our inquiry into the reasons why civilizations break down.³ We have watched this intractability asserting itself by frustrating Man's attempts to adjust his existing institutions to meet a new situation produced by the genesis of new dynamic forces or creative movements within a society's bosom, and we have seen that this frustration may take either of the two alternative courses of precipitating revolutions or engendering enormities. We can now see that these crises arising from the emergence of newly created forces welling up from within are analogous to the crises produced by the impact of newly encountered forces impinging from outside, and that the enormities in which a civilization comes to grief are fruits of Zealotism, while the revolutions which are the alternative penalty for maladjustment are no less characteristic fruits of the antithetical Herodian response to the same challenge.

The Ineffectiveness of the Zealot-Herodian Response

If we have been right in our verdict that the ostensible contrast between Zealotism and Herodianism masks a family likeness, and that these two psychological reactions to the intrusion of an alien culture are, in truth, merely two variations on an identical theme, we should expect to find this affinity of character translating itself into a similarity of effect; and, sure enough, we do find the unmasked resemblance between Zealotism and Herodianism betraying itself in nothing so patently as in their common failure.

The ineffectiveness of this Zealot-Herodian response to the challenge of a cultural assault is manifest in the historic case that we have taken as our prototype. In Jewry's encounter with a post-Alexandrine Hellenism, neither variant of the assaulted society's defensive reaction availed to achieve the common purpose of finding a solution for Jewry's Hellenic problem that would be practicable and at the same time tolerable.

¹ See V. vi. 94-97.

² See V. vi. 213-42.

³ See IV. iv. 133-245.

Herod the Great and his school of Herodian *politiques* failed to persuade or compel their Zealot-minded compatriots to acquiesce in a political autonomy under Roman hegemony which would have given the Palestinian Jewish community a chance of coming to terms with Hellenism without losing its own communal identity in its ancestral home, while the Zealots succeeded in sabotaging this Herodian policy, only to bring the Palestinian Jewish community to the destruction which the Herodians had foreseen and foretold as being inevitable if the Zealots should once succeed in taking the bit between their teeth. The catastrophes of A.D. 70 and A.D. 135 proclaimed the bankruptcy of Herodianism in closing the door on the possibility of a cultural compromise between Judaism and Hellenism, and at the same time exposed the folly of Zealotism by turning a Jerusalem that, in the Zealots' dreams, was to have been the sacrosanct capital of a Messianic Jewish state into the forbidden city Aelia Capitolina, whose pagan precincts were placed out of bounds for all heirs of the Covenant of Circumcision.¹ Thereafter, any Jew who wished to share in the good things of Hellenic life had to purchase his freedom of the Hellenic cosmopolis by making a clean cut with his own Jewish cultural heritage, in the fashion set by the Alexandrian Jewish Platonist philosopher Philo's nephew the Roman citizen and civil servant Tiberius Alexander, while the only way left open for maintaining a distinctive Jewish communal life was Rabbi Johanan ben Zakkai's forlorn hope of ritualism-in-diaspora.

It would be superfluous to call up again the rest of our muster of Zealots and Herodians to demonstrate that the same pair of psychological reactions resulted in the same failure in all other encounters between an assaulted society and an assailant culture in which the tragedy had already been played out to its conclusion by the time of writing; for these repetitions of Jewry's classic experience stand on record in this work in our foregoing survey of encounters between contemporaries.² In this place we need only observe that the ineffectiveness of the Zealot-Herodian reaction has been registered implicitly *a priori* in our identification of Zealotism with an Archaism that breeds enormities, and of Herodianism with a Futurism that precipitates revolutions, since revolutions are confounded with enormities, and futurists with archaists, in the common grave of their uniform failure.

The nature of the corresponding failure of Zealotism and Herodianism may be probed to its spiritual essence, below its social surface, by an intellect that does not disdain the immemorably ancient symbolism in which the subconscious depths of the Soul express intellectually ineffable spiritual truths. A poetic imagery in which the spirit reveals itself in the physical disguise of water has already given us an insight into the 'conductivity' of a universal state;³ for, when we liken an oecumenical empire to the Ocean into which all Earth's rivers discharge, we find that this apparently still and dead expanse of salt water is in constant and creative motion, and that the rivers, which appear so mobile and lively by contrast, would soon cease to flow if their sources were not perpetually being fed by the life-giving rain that is perpetually being distilled from the

¹ Acts vii. 8.

² On pp. 346-453, above.

³ See VI. vii. 60-61.

surface-water of the Sea as it perpetually ascends into Heaven. In our subsequent study of the spiritual influences derived by transfrontier barbarians from their proximity to the body social of a civilization on the other side of the *limes* of a universal state, we have found our insight in a simile¹ in which we have likened this *limes* to a dam that first converts the upper basin of a mountain torrent into a reservoir and then brings the accumulated waters down in spate when the barrage collapses at last under a pressure that has mounted to the breaking-point.

In terms of the same expressive imagery, we may liken the Zealot-Herodian reaction to the *riposte* contrived by a pixie whose Lake of the Woods, inviolate hitherto since the beginning of Time, has suddenly and unexpectedly been sullied by the keel, and ruffled by the paddle, of an audacious backwoodsman's canoe. What apotropaic use will this outraged pixie's fury and dismay move her to make of her superhuman magic power in order to checkmate the sacrilegious human intruder? If her defensive psychological reaction takes a Zealot turn, the Lady of the Lake will render her waters unnavigable by freezing them solid, while, if it takes an Herodian turn, she will render navigation impossible by the alternative retort of draining her lake-bed dry. Whether the sacrosanct water is frozen or whether it is drained away, it will have been made equally impervious to the passage of a man-made vessel. Yet, in working either miracle, the luckless nymph will have betrayed her sub-human *naïveté*; for, in her single-minded anxiety to put the boatman out of action, she has lost sight of the devastatingly simple truth that Man's sophisticated and hazardous art of navigation² comes considerably less easy to him than the human biped's natural method of locomotion. A lake that has been closed to navigation by being either drained or frozen can be traversed by a land-lubber dry-shod. In short, the nymph will have reacted to the human intruder in a way that will have defeated her intentions by serving his purposes. So far from effectively arresting the invader's progress, her magic *tour de force* will have appreciably facilitated it.

3. *Evangelism*

Was this uniform self-defeat of Zealotism and Herodianism the last word that the oracles of History and Mythology had to speak when asked for light on the spiritual consequences of encounters? If it were indeed the last, then the outlook for Mankind would be forbidding, for then we might be driven to the conclusion that our present enterprise of Civilization was an impracticable attempt to climb an unscalable pitch.³

This great enterprise was initiated, as we may recollect,⁴ by a new departure in which Human Nature's powers of imagination, intrepidity, and versatility proved a match for the difficulties besetting the change of orientation which Mankind managed to achieve at that momentous stage in human history. A Primitive Man, who had long since been brought to a halt by an Epimethean direction of his faculty of mimesis

¹ See pp. 3-11, above.

² See II. i. 326-7.

³ This simile of the climber's pitch has been propounded in II. i. 192-5.

⁴ See *ibid.*, p. 192.

towards his stick-in-the-mud elders and ancestors, now reliberated his Promethean *élan*¹ by redirecting this same socially indispensable faculty towards creative personalities who offered themselves to him as path-finding pioneers. How far, a latter-day inquirer was bound to ask himself, was this new move going to carry these primitive culture-heroes' epigoni? And, when its momentum had been exhausted, would they be able to draw upon a hidden store of psychic energy by repeating the creative stroke with which Moses had once conjured the water out of the rock?² If the answer to this last question were to be in the negative, it would be a bad look-out for a half-baked Man-in-Process-of-Civilization; and this was why, for him, an archaistic Zealotism's and a futuristic Herodianism's common curse of ineffectiveness was, in itself, so disquieting an omen.

The omen was disquieting because the Zealot-Herodian reaction in particular, like the Archaist-Futurist reaction in general, was manifestly an unsuccessful attempt to re-perform the miraculous act by which a creative minority of Primitive Mankind had once succeeded in passing over from the Yin-state of an apparently hard-set stagnation into the Yang-movement of an astounding renewal of progress. In that successfully negotiated transition from Primitive Life to Civilization the adoption of the forward-looking attitude had released a creative energy strong enough to overcome the backward-looking attitude's inertia; but, in the Archaist-Futurist and Zealot-Herodian reactions of a Civilization in trouble, neither of the two formally antithetical component attitudes was proving to have any virtue in it. Was this the end of the story?

Perhaps the true answer to this anxious question was that this might well be the end if the whole story was comprised in the history of Civilization, but not if Man's attempt at Civilization was no more than one chapter in the story of a perennial encounter between Man and God. In the myth of the Flood as recounted in the Book of Genesis, the sequel to a cataclysm in which Adam's brood had been all but annihilated by their outraged Maker was God's proclamation of an 'everlasting covenant between God and every living creature of all flesh that is upon the Earth'. The Creator's promise to Noah and his salvaged crew was that 'the waters shall no more become a flood to destroy all flesh';³ the token of this covenant was the bow set and seen in the cloud; and indeed we have discovered, in the act of registering the equal failure of Archaism and Futurism, and, likewise, of Enormities and Revolutions, that, in either of those two apparently inescapable dilemmas, there is a third possibility which offers a hard-pressed Theseus a chance of escaping imminent destruction by boldly vaulting between the terrible horns on which a Minotaur has been seeking to impale his puny human antagonist.

When Life is challenged by the emergence of some new dynamic force or creative movement from within, the living individual or society is not thereby condemned to make the futile choice between breaking down by perpetrating an enormity and breaking down by detonating a revolution; there also lies open a middle way of salvation in which a mutual adjust-

¹ See III. iii. 114.

² Exod. xvii. 1-7.

³ Gen. ix. 8-17.

ment between the old order and the new departure can arrive at a harmony on a higher level which is another name for growth.¹ And similarly, when Life is challenged by a breakdown that has become an accomplished fact, an individual or society that is striving to recapture from Fate the initiative in its fight for life is not condemned to make the no less futile choice between the two inherently impracticable escapades of attempting to jump clear of the Present up the Time-stream into a lost Past and attempting to jump clear down the Time-stream into an unattained Future;² for, here too, there lies open the middle way of a withdrawal through a movement of Detachment followed by a return that reveals itself in a Transfiguration.³ In the prosaic language of a nascent post-Modern Western science of Psychology,

'In every conflict a dynamic opposition occurs, and in this opposition some elements transcend from one side to the other and *vice versa*. Through this reciprocal action . . . a new condition is reached which was not a predictable outcome of the conflict.'⁴

Is this divine act of new creation performed likewise when the encounter between Man and God achieves itself in a collision between two diverse human societies, and when the pair of equally barren psychological reactions in the souls of the children of the assaulted society are the two that we have now learnt to know as Zealotism and Herodianism? As we stand on the marge of the Pool of Bethesda⁵ and watch a savage Zealot seeking to save the sacred water from a dominant Gentile's polluting touch by freezing it, while a ruthless Herodian is seeking simultaneously to secure the same ritual satisfaction by draining the precious water away, our eyes turn towards the surrounding porches to gaze pityingly upon that 'great multitude of impotent folk—of blind, halt, withered'—whom we see lying there 'waiting for the moving of the water'.

The Zealot's and the Herodian's feelings remain stonily unmoved by this spectacle of their afflicted fellow human beings' piteous plight and sore need for healing. These two rival self-appointed champions of Jewry are both so inhumanly intent on the waging of their cultural war with Hellenism in accordance with their respective tactics that, in the service of an alleged military necessity, they neither of them feel any compunction as they deprive their own forefather Abraham's suffering children of their last ebbing hope of salvation. Will this unmerciful pair of pedants succeed, between them, in consummating their futile atrocity before the season arrives for the angel to go down into the pool and trouble the water with the miraculously transfiguring effect, for the sufferer who then first steps in, of making him whole of whatsoever disease he has had? No answer to our question is to be expected from combatants in a cultural war who are totally preoccupied with the conduct of their Lilliputian hostilities; but, above the un-Homeric hubbub

⁵ John v. 2-9.

of a Judaeo-Hellenic Battle of Frogs and Mice, let us hear also what Saint Paul saith:¹

'Is He the God of the Jews only? Is He not also of the Gentiles? Yes, of the Gentiles also;² for there is no difference between the Jew and the Greek; for the same Lord over all is rich unto all that call upon Him.³ For by one spirit are we all baptised into one body, whether we be Jews or Gentiles, whether we be bond or free.⁴ There is neither Jew nor Greek, there is neither bond nor free, there is neither male nor female; for ye are all one in Christ Jesus⁵—where there is neither Greek nor Jew, circumcision nor uncircumcision, Barbarian, Scythian, bond nor free; but Christ is all and in all.⁶

The blessing vouchsafed to Saint Paul and his fellow evangelists is:

'He that shall lose his life for My sake and the Gospel's, the same shall save it.'⁷

In Paul, Judaism did lose its life in so far as, for some two hundred years and more before Paul's day, Judaism had been living for the ideal of preserving its own ancestral Syriac way of life against penetration by the masterfully intrusive alien culture of Hellenism. Paul was born and brought up in a Gentile Tarsus as a Pharisee—a cultural 'isolationist'⁸—and at the same time and place he received a Greek education and found himself a Roman citizen. The Zealot and the Herodian path thus both lay open in front of him, and as a young man he opted for Zealotism.

¹ In the Tarsian evangelist's heavenly Christian strains we can catch echoes of the lovely pagan music of a Mantuan poet who, like Paul, had been a Roman citizen. Paul's discernment that 'there is no difference between the Jew and the Greek' had been anticipated, almost phrase for phrase and rhythm for rhythm, in a Virgilian Dido's *Tros Tyrisque mihi nullo discrimine agetur* (*Aeneid*, Book I, l. 574), while Aeneas' *Paribus se legibus ambae invictae gentes aeterna in foedera mittant* (*Aeneid*, Book XII, ll. 190-1) foreshadows Paul's 'By one spirit are we all baptised into one body, whether we be Jews or Gentiles'. Virgil's poem is, in truth, the pagan gospel of the cult of an Occumenical Collective Humanity—Mankind incorporated into one universal body politic under the aegis of a Dea Roma and under the auspices of a Divus Caesar—and it was no accident that a spiritual war to the death with this noblest of all avatars of the most vicious of all forms of idolatry should have been the earliest ordeal of an infant Christian Church.

With an eye to the particular theme of the present chapter of this Study, we may notice, in passing, that Virgil was aware of the spiritual truth that a declaration of the common bankruptcy of Herodianism and Zealotism is, in the same breath, the revelation of a saving middle way. When the inevitable detection of Coroebus's Herodian ruse of putting on the armour of a slain and despoiled antagonist has been followed by the slaying of Coroebus himself and those other comrades of Aeneas who have followed Coroebus's example (*Aeneid*, Book II, ll. 424-9), the mythical Dardanian prototype of a mundane Roman saviour of Society is restrained, by the intervention of the Gods, from acting on a suicidal impulse to find his alternative to an Herodian's abortive stratagem in a Zealot's heroic death. When the epiphany of Venus has been frustrated by the obstinacy of Anchises, and the hero sprung from the union of the goddess and the mortal reverts, in desperation, to his Zealot watchword *Moriamur et in media arma ruamus* (l. 353) in his cry *Arma, viri, ferite arma: vocat lux ultima victos* (l. 668), the Man of Destiny's heart is lifted, at this critical moment, above an ephemeral battle by the sudden miracle of the child Iulus's transfiguration (ll. 681-4). The tongue of fire that sits upon Iulus's head, and the *khvarenah* that plays about his locks and temples, are Virgilian counterparts of the tongues of fire that crown the heads of Christ's apostles on the Day of Pentecost (Acts ii. 3), and of the sheen of Christ's own face and raiment in the manifestation of His divinity on the mountain (Matt. xvii. 2; Mark ix. 3; Luke ix. 29).

⁷ Mark viii. 35. Cp. Matt. x. 39 and xvi. 25; Luke ix. 24 and xvii. 33; John xii. 25.

⁸ See V. v. 73, n. 4.

But, when he was plucked out of this perverse initial Zealot course by his vision on the road from Jerusalem to Damascus, Paul did not then perforce become an Herodian. He did not then find himself confined to a choice between one or other of these two barrenly defensive and uncreative lines of action; there was revealed to him a creative way which transcended them both.

Paul traversed the Roman Empire preaching neither Judaism versus Hellenism nor Hellenism versus Judaism, but a new way of life—Christianity—which drew, without prejudice, upon the spiritual wealth of both those two contending cultures and offered itself, with an impartially benignant hospitality, to any member of either of those two societies—or of any other civilization within the oecumenical theatre of the Evangelist's spiritual operations. No cultural frontier could stand in this Gospel's way; for the Christian Church was not just a new society of the same species as the civilizations whose encounters with one another we have been investigating in the present Part of this Study; it was a society of a different species, distinguished by a new revelation of the nature of God and of the character of Man's relation to Him. The creatively dramatic *peripeteia*, or 'reversal of the situation', which followed from the encounter between Jewry and Hellenism, was thus not achieved in any episode among the vicissitudes of alternating victory and defeat in these two civilizations' long-drawn-out duel; it was manifested in the transcending of both these civilizations by a newly revealed higher religion that had made its epiphany 'above the battle' which Judaism and Hellenism were fighting with one another.

At the date at which these present words were being written, the Syriac and the Hellenic Civilization alike had long since passed out of existence, and even the Jewish relic of the Syriac Society was extant only in the shape of a social fossil; but the Christian Church, born of a creative response to the challenge which the encounter between those two now extinct civilizations had once presented to their children, was then still the outstanding spiritual force in the oecumenical mission-field of a Westernizing Latter-day World; and, in the light of the first nineteen centuries of Christianity's earthly pilgrimage, a twentieth-century historian might venture to predict that Christianity's transfiguring effect on the World up to date would be outshone by its continuing operation in the future.

A Christian-bred historian, however, would be a traitor to the genius of his ancestral faith if, in allowing himself to think this serenely sanguine thought, he were also to allow the abominable and desolating idol of a corporately worshipped Self to resume possession of his soul in the sacrilegious guise of a chauvinism on behalf of one finite revelation of God's infinite light, merely because the Judaeo-Hellenic facet of a terrestrial lamp's dark glass¹ happened, as a fortuitous consequence of his time and place of birth, to be more familiar to him personally than Christianity's Indo-Hellenic counterpart. To guard against the sin of both heart and head that a Christian would be committing most grievously against God's Divine Majesty, provoking most justly God's wrath

¹ 1 Cor. xiii. 12.

and indignation¹ against the sinner, if he should refuse to honour any manifestation whatsoever of the one and indivisible Divine Light, the Christian-bred student of God's dealings with Man will remind himself that a post-Alexandrine Hellenism, after forcing an entry into a Hittite, an Egyptian, and a Babylonian, as well as a Syriac, World in the fourth century B.C., had proceeded, in the second century B.C., to push its way into an Indic World likewise, and that, out of this Indo-Hellenic encounter, a higher religion akin to Christianity had made its epiphany.

The Mahāyāna transfigured the self-regardingly Self-dispelling *askēsis* of the Hinayanian arhat into the unselfishly Self-detaining evangelism of the Mahayanian bodhisattva.² A philosophy that had offered the spiritual athlete (on condition of his proving able to stay the arduous course) his salvation through the achievement of a complete detachment from both himself and his fellow living creatures, was transformed into a religion whose ideal figure was not the sage attaining *Nirvāṇa* for himself but the saviour of his fellows who, for their sakes, had made the supreme personal sacrifice, not of suffering the pains of a voluntarily accepted death, but of enduring the pains of a voluntarily protracted existence, in order to guide the feet of others into the way of peace³ at the price of postponing, *in saecula saeculorum*, this Buddha-Saint's own entry into his hard-won rest.⁴

At the time of writing, half-way through the twentieth century of the Christian Era, Christianity and the Mahāyāna were the two great living witnesses⁵ to the spiritual significance of the social phenomenon of encounters between civilizations—a phenomenon that had been recurring with an ever greater frequency and at an ever higher potency since the species of societies called civilizations had made its first appearance some five or six thousand years ago. Humanly speaking, it was a creative response to the challenge of one of these encounters that had brought to birth Christianity and the Mahāyāna and Islam and Hinduism.

In an age in which the entire habitable and traversable face of the planet had been roped in by far-reaching Western hands to constitute thenceforth a single common arena, common exercise-ground, and, perhaps one day, common home for a united human family, it might be predicted that, in the next chapter of a henceforth oecumenical human history, the four higher religions sprung from the ruins of civilizations of the second generation were destined to have an intimate spiritual encounter with one another; and, whatever the outcome of this great imminent spiritual event might prove to be, it was evidently likely to inaugurate a new era in human life in This World.

The goal of Man's spiritual endeavours in an unborn age beyond the historian's horizon might be divined by an understanding heart⁶ from a reading⁷ of the words that the Tarsian Jewish apostle of Christianity

in partibus Gentilium is reported to have uttered in an impromptu address¹ to an Athenian audience on the Areopagus.

'God that made the World and all things therein . . . hath made of one blood all nations of men for to dwell on all the face of the Earth, and hath determined the times before appointed, and the bounds of their habitation, that they should seek the Lord, if haply they might feel after Him and find Him—though He be not far from every one of us; for in Him we live and move and have our being, as certain also of your own poets have said:² "For we are also his offspring".'

VIII. C, ANNEX

THE TEMPORARY HALT OF THE WESTERN CIVILIZATION'S FRONTIER IN NORTH AMERICA AT THE EDGE OF THE GREAT PLAINS

THE occupation of North America by a Western Civilization which had originated on the other side of the Atlantic had been one of the greatest feats of expansion known to History down to the time of writing. This gigantic enterprise had been carried out within a period of less than four hundred years, reckoning from A.D. 1519, the year in which Cortés and his companions had made, in Mexico, the first permanent lodgement of West European invaders on Continental North American ground, to A.D. 1890, the year in which the internal frontier of agricultural settlement within the expanded political boundaries of the United States had been wiped out by the completion of the effective occupation and settlement of the whole national territory. Within those 371 years the whole of North America had in fact been occupied up to its natural frontiers—the Pacific coast and the southern edge of the Esquimaux' preserve in the Arctic Zone¹—by conquerors and colonists who had landed at divers points on the Atlantic coast from A.D. 1519 onwards.

The magnitude of this achievement of the pioneers of the Western Civilization in North America may be measured by comparing it with the same civilization's previous expansion in the Old World. Starting from its original patrimony—those derelict western provinces of the Roman Empire in which the North European and Eurasian barbarian invaders had been converted to Latin Christianity without being subsequently conquered either by the Arab Caliphate or by the East Roman Empire—the Western Civilization, during its Dark Ages and Middle Ages, had taken more than six hundred years, reckoning from the opening of Charlemagne's counter-offensive against the pagan Saxons in A.D. 772 to the conversion of the pagan Lithuanians to Latin Christianity in A.D. 1386, to occupy the northern zone of Western Europe from the northern fringes of the Rhine Basin and the Upper Danube Basin up to the southern fringe of the Arctic Zone. Before that, the Hellenic Civilization's occupation of Western Europe, from the Appennines up to a natural frontier provided by the shores of the Atlantic and an artificial *limes* drawn along the Rhine-Danube river line,² had taken a quarter of a millennium, reckoning from the beginning of the Roman advance into the Po Basin after the close of the First Romano-Punic War in 241 B.C. down to Augustus's decision, after the Roman military disasters of A.D. 6–9 at the hands of the Pannonians and the Cherusci, to abandon his attempt to carry the frontier forward to the line of the Elbe. In this post-Alexandrine Hellenic and in the subsequent Medieval Western expansion of a civilization into European territory previously

¹ See III. iii. 4–7.

² See 'The Rhine-Danube Frontier of the Roman Empire', in V. v. 591–5.

occupied by barbarians or by primitive peoples, the area occupied had in either case been trifling by comparison with the area in North America, within the natural frontiers indicated above, that was occupied by the Western Civilization between A.D. 1519 and A.D. 1890.

Moreover, the major part of this Western achievement in North America that was consummated in A.D. 1890 had been accomplished within the last 127 years out of the total span of 371 by the people of the United States within the middle transcontinental zone of North America over which the United States' political domain had expanded. The eventual area of the Continental United States west of the Appalachian and Alleghany Mountains had been occupied and settled since the end of the Seven Years War (*gerebatur* A.D. 1756-63).

The American people's spectacular contribution to the total result was, of course, matched, and was also, no doubt, at least partly accounted for, by the unusual advantages which the United States had enjoyed during this expansive period. She had, in fact, succeeded in having the best of both worlds for a hundred years and more. She had managed to remain economically 'in' the Old World after having extricated herself from being politically 'of' it.

Between A.D. 1763 and A.D. 1820 the whole of North America had been liberated from European political entanglements as a result of the elimination of French rule from Canada and the Mississippi Basin in the Seven Years War (*gerebatur* A.D. 1756-63), the elimination of British rule from the Thirteen Colonies and Florida in the Revolutionary War (*gerebatur* A.D. 1775-83), the Louisiana Purchase completed in A.D. 1803, the acquisition of Florida from Spain by the United States in A.D. 1819, the liquidation of Spanish rule in Mexico in A.D. 1820, and, above all, Great Britain's policy of drawing a cordon of sea-power round the Continental European bases of the other Great Powers of the day. If the British Navy had not made it impracticable for Napoleon to take delivery of Louisiana after he had extorted from the Spanish Government a retrocession of the title deeds, President Jefferson would not have found the purchase so easy to negotiate. This British benefaction to the United States had been incidental and undesigned; but, after the close of the Anglo-American War of A.D. 1812-14 and the final overthrow of Napoleon at Waterloo, it had become a standing rule of British policy that Great Britain should keep clear of Continental European entanglements inside her naval cordon and should at the same time keep on good terms, outside it, with the United States, which, in the nineteenth century, was the only naval Power in the World that could have threatened Great Britain's strategic position from the rear; and in these circumstances the maintenance of Canada's political association with the United Kingdom had not, during the century ending in A.D. 1914, threatened to entangle North America in European conflicts.

Meanwhile, during the same century ending in A.D. 1914, a United States who had thus escaped from European political entanglements had been able still to draw on European economic resources—both on European population in the shape of immigrants and on European capital in the shape of loans transferred through the importation of

European manufactures—to assist her in pushing forward her western frontier of effective occupation and settlement from the line of the Appalachians and the Alleghanies, along which it had run in A.D. 1763, right across North America to the Pacific Coast within little more than 125 years. During the same period the effectiveness of Western economic resources—whether imported from Europe or produced in North America itself—had been vastly enhanced by the Industrial Revolution in Technology, which had given Western Man an unprecedented command over the rest of terrestrial creation, human and non-human alike.

In these nineteenth-century circumstances the conquest of North America by the people of the United States, impressive though it had been, could not be regarded as an inexplicable miracle. The remarkable feature in the story was not that the American people should have won the West, but that their puissant westward advance should have been checked, even temporarily, by any section of the pre-Columbian population of North America whose habitat had lain athwart the pioneers' path. The distinction of having made this exceptional and remarkable stand belonged to the Plains Indians.

"The Plains Indians constituted for a much longer time than we realise the most effectual barrier ever set up by a native American population against European invaders in a temperate zone. For two and a half centuries they maintained themselves with great fortitude against the Spanish, English, French, Mexican, Texan, and American invaders, withstanding missionaries, whisky, disease, gunpowder, and lead."¹

It was not, perhaps, so surprising that the Plains Indians should have maintained themselves from A.D. 1535 to A.D. 1848 against the Spaniards and their Mexican successors; for, apart from the notable invention of firearms, the equipment of Early Modern Western Man—particularly in means of transportation, which were of vital importance on the Great Plains—was not more efficient than the equipment of the Romans had been; and the epigoni of the Spanish conquerors of Mexico were more backward in their technology than most of their contemporaries in other parts of an expanded Western World.² It was more noteworthy that for more than fifty years—from about A.D. 1821 till the eighteen-seventies—the eastern edge of the Great Plains should have set a limit to the westward advance of the agricultural frontier of the United States.

Between A.D. 1763, when French rule had been eliminated from the Mississippi Basin, and A.D. 1821, when Missouri had been admitted to statehood in the United States, the westward-flowing tide of American agricultural settlement, when once it had gathered sufficient head to force its way over the barrier of the Appalachian Mountains, had found no halting place at the line of the River Mississippi, which had been the western political frontier of the United States for the first twenty years (A.D. 1783-1803) after the end of the Revolutionary War. The Mississippi, like the Rhine and the Danube, had indeed been designed by Nature to serve human purposes not as a *limes* but as an artery of inland

¹ Webb, W. P.: *The Great Plains* (New York 1931, Ginn), p. 48. The quotations from this book have been made with the permission of the author and the publishers.

² See the example noticed in III. iii. 136, n. 1.

water communications, and the advancing host of migrant farmers had taken the passage of the great river in its stride.¹ Missouri had been settled between A.D. 1815 and A.D. 1819, and the town of Independence, near the north-western corner of the new state, had been founded in A.D. 1827.² At the western boundary of Missouri, however, the pioneers of an agricultural civilization had reached a limit that, in contrast to the Western Waters which had floated them on their way by providing them with a ready-made means of transportation, proved to be a really formidable obstacle to their farther westward progress. They had reached the end of the timbered country and the beginning of a treeless steppe;³ and at this line their advance was checked.

During the half-century following the year A.D. 1821, in which Missouri was admitted to statehood, the American farmers and planters completed their occupation of the timbered country in the Mississippi Basin by bringing under cultivation Arkansas, Eastern Texas, Wisconsin, and Eastern Minnesota; and within the same period they also brought under cultivation the Great Eastern Bay of the treeless prairie, which penetrated the timbered country in a salient extending eastwards across Iowa and over the greater part of Illinois.⁴ During the second half of the period they began to nibble at the fringe of the Great Plains themselves in Kansas; but the American pioneers on the Great Plains were not the farmers; they were the cattlemen who made their first drive northward from the south-western corner of Texas to the Missourian section of the borderline between woodland and prairie in A.D. 1866;⁵ it was not till the eighteen-seventies that the American farmers began to conquer the Great Plains for the plough on the grand scale; the resistance of the Plains Indians was not completely overcome till A.D. 1876; and in that year Chief Sitting Bull's war-band of Sioux, hardly more than four months before their surrender on the 31st October, inflicted on the United States Army the most severe reverse that it ever suffered at Indian hands when, on the 25th June, they wiped out Custer's attacking force of 265 men.⁶

What is the explanation of these exceptional powers of resistance—displayed by the Great Plains and their pre-Columbian human occupants—to which the history of the United States as well as Mexico bears witness? The prime cause is to be found in the physical intractability of the *terrain* itself to cultivation by a sedentary society not yet equipped with the appropriate tools that were eventually to be forged by a Late

¹ See Paxson, F. L.: *History of the American Frontier, 1763-1893* (Boston 1924, Houghton Mifflin), chaps. 21-24. The quotations from this book have been made with the permission of the publishers.

⁴ This salient of the North American prairie was a counterpart of the Great Western Bay of the Eurasian Steppe—extending, between the southern limit of the Russian forests and the north shore of the Black Sea, up to the eastern foothills of the Carpathians—which a southward-flowing tide of Russian peasant pioneers had been bringing under cultivation since A.D. 1774, simultaneously with the American farmers' and planters' westward advance up to the eastern edge of the timberless zone of North America.

Modern Western Industrial Revolution; and a secondary cause is to be found in the mistakes committed by the pioneers of the Western Civilization in dealing with the Plains Indians after these pioneers had made their first contacts with them. West European Man in North America duly repeated the classical mistake, examined in the Part of this Study to which the present Annex attaches, which, on other frontiers between a civilization and barbarians, had eventually given the barbarians the victory; and it is not inconceivable that History might have followed the same course in North America as in the Old World if the southern edge of the Great Plains, where these impinged on Mexico, had not been forcibly taken over from Mexico by the United States in A.D. 1846-48¹ and if thereafter the conquest of the Great Plains for agriculture had not been made possible for the American farmer by the invention and mass-production of new-fangled tools for dealing with unprecedented agricultural problems.

In a pre-industrial age of Western history the settlement and cultivation of the Great Plains by Spanish *encomienderos* with their Mexican peons or by planters from the South-Eastern United States with their Negro slaves or by farmers from the North-Eastern United States with their own hands was precluded by the absence of timber and the dearth of water near the surface. The Spanish explorers who reconnoitred the Great Plains from both the south-west and the south-east in A.D. 1535-41, and at least two American explorers who reconnoitred them in the second decade of the nineteenth century, were unanimous in declaring that this country was an irreclaimable desert. Hugh M. Brackenridge, in his *Journal of a Voyage up the River Missouri*, published in A.D. 1816, wrote that, from a point six hundred miles above the debouchure of the Missouri into the Mississippi, the country

'becomes more dreary and desert till it reaches the Rocky Mountains, and can never have any other inhabitants than the few that may exist at certain stations along the river. . . . It combines within its frightful and extensive territory the Steppes of Tartary and the moving sands of the African deserts.'²

Thereafter Major Stephen H. Long, in his report on an expedition into the Plains that he had made in A.D. 1820, committed himself to the statement that,

'In regard to this extensive section of country, I do not hesitate in giving the opinion that it is almost wholly unfit for cultivation, and of course uninhabitable by a people depending on agriculture for their subsistence.'²

A twentieth-century American historian comments that 'Major Long not only failed to unlock the secrets of the Far West; he set up a psycho-

¹ In thus annexing from Mexico the southern extremity of the Great Plains, which had been under Mexican sovereignty *de jure* but not *de facto*, the United States was doing for Mexico the same unintended and unwelcome yet nonetheless valuable service that Russia did for Persia when she conquered and annexed Transcaspia and Transoxania between A.D. 1863 and A.D. 1886. While Russia thereby relieved Persia from raids by Türkmens and Uzbeks, the United States relieved Mexico from raids by Comanches and Apaches.

² Quoted by Paxson in *op. cit.*, p. 216.

logical barrier that kept others from disproving his falsehoods'.¹ 'The tradition of the Great American Desert was at its height in the decade between 1850 and 1860.'² 'Until after the Civil War the impression persisted that the farming frontier could never invade that inhospitable region.'³ Yet, as a later passage in Billington's book testifies, Brackenridge's and Long's appreciation of the Great Plains was not incorrect in the technological circumstances of the time at which it was made. It was falsified only when the technique of the Industrial Revolution was brought to the baffled farmers' assistance.

'The Plains were opened to pioneers during the eighteen-seventies not by adventurous trailblazers but by inventors toiling over drafting boards, labourers sweating over whirring machines, and production managers struggling with the complexities of assembly-lines; for those were the men who applied the techniques of the Industrial Revolution to the unique problems of America's last frontier. Their success made expansion possible.'⁴

The inventions that eventually conquered the Great Plains for the plough were the railroad, barbed wire for fencing in a treeless landscape, machinery for drilling deep wells instead of digging shallow wells, windmills for raising water from these deep wells automatically instead of by human muscle-power, and ingenious and complicated new agricultural implements.⁵

'The Industrial Revolution freed American farmers from Time-shackles which had bound them since land was first tilled.'⁶

And the tale of this technological triumph is recapitulated in a comparison between two sets of figures.

'407,000,000 acres were occupied and 189,000,000 improved between A.D. 1607 and A.D. 1870; 430,000,000 acres peopled and 225,000,000 placed under cultivation between A.D. 1870 and A.D. 1900.'⁷

Meanwhile, between A.D. 1519 and the eighteen-sixties, the pioneers of the Western Civilization in North America who had reached the edge of the Great Plains had made, as has been noted already, a classical mistake which, in the Old World, had repeatedly enabled barbarians to turn the tables on their assailants; and the same mistake had been committed by the Spanish Government in Mexico and by the United States Government in turn. This mistake had been to allow themselves, when once they had given provocation to neighbouring primitive societies by starting an aggressive advance into their country, to be deterred, upon reaching the edge of an apparently forbidding tract of *terrain*,⁸ from proceeding with their occupation, in the teeth of this local obstacle, until their advance had brought them to a natural frontier with no potential transfrontier barbarians beyond it. In the Old World such rashly unsustained and inconclusive advances into the domains of the

⁸ See p. 36, n. 1, above.

primitive societies had been apt to cost a half-heartedly aggressive civilization dear. The more catastrophic of the two alternative possible consequences had been the prompt precipitation of an avalanche of barbarian counter-invasion;¹ the less immediately disastrous alternative had been the establishment of an artificial *limes* along the outer edge of the intractable *terrain*; but in the long run this alternative had been no less fatal than the other, since the fundamental 'law' of the *limes* had proved to be that the passage of Time tells in the barbarians' favour. This 'law' duly asserted itself in North America when Spain and the United States made successive attempts to establish a permanent artificial *limes* along the edge of the Great Plains.

The policy of drawing a would-be permanent artificial *limes* at the edge of the Great Plains was inaugurated by the Spaniards after a series of four discouraging reconnaissances from Mexico and Florida into the heart of North America² within the six years A.D. 1535-41.³ One of the liabilities of the Mexic Civilization which its Spanish conquerors had taken over perforce was a chronic feud between the warlike hunting tribes on the Plains and the northernmost outposts of a pre-Columbian sedentary agricultural society.⁴ In A.D. 1593, little more than half a century after the Spaniards' first encounters with the Plains Indians, they suffered their first serious reverse at their hands.⁵ The policy of peaceful penetration and conversion through the activities of Roman Catholic Christian missionaries, feebly supported by military force, which proved successful in dealing both with the sedentary agricultural pueblos in New Mexico⁶ and with the primitive food-gathering tribes in California, was of no avail with the Plains Indians. A mission planted on the San Saba River, in the Apache country, in A.D. 1757 was wiped out by the Apaches in A.D. 1758.⁷

The Spanish authorities' reaction to this disaster was to adopt, in A.D. 1772, a recommendation, made by the Marquess de Rubí after an official inspection of the frontier zone in A.D. 1766-7, that, in order to set limits to the raids of the Plains Indians into New Spain, a *limes*, in the form of a chain of fifteen forts, should be drawn from coast to coast along a line which—everywhere except in its easternmost sector, where it was drawn through San Antonio, Texas, to Bahia del Espiritu Santo on the shore of the Gulf of Mexico—ran to the south-west of the Rio Grande, well within the future frontier between Mexico and the United States that was to be established by the peace settlement of A.D. 1848 and the Gadsden Purchase of A.D. 1853.⁸ When this Augustan policy

¹ See p. 12, above. Instances of this historical phenomenon have been noted in V. v. 209, n. 3.

² Brief accounts of the expeditions of Cabeza de Vaca, Marcos de Niza, Coronado, and de Soto will be found in Webb, *op. cit.*, pp. 95-114.

³ These four Spanish incursions overland, like the five Norse incursions from Greenland into the north-eastern fringes of Continental North America (see II. ii. 292-3), were all made on the morrow of the original settlement and were never thereafter followed up. The Norse incursions were all made within forty years of the Norse colonization of Greenland in A.D. 985-6, the Spanish incursions all within twenty-two years of Cortés' landing in Mexico in A.D. 1519.

likewise proved a failure, the Spanish authorities in A.D. 1777-8 planned, but never carried out, an assault upon the Apaches, with the assistance of the Comanches, on the lines of Marcus Aurelius's attempt—abandoned after his death by Commodus—to subjugate, and incorporate into the Roman Empire, the domains of the Quadi and Marcomanni beyond the Augustan *limes* along the middle course of the Danube.¹

'One would judge that, with experience, the task of conquest and occupation would grow lighter; but, on the contrary, it became heavier, and eventually impossible. . . .²

'As late as A.D. 1842, George W. Kendall, a member of the Santa Fé expedition, records that, as far south as Durango, the miserable inhabitants remained within their walled towns out of fear of the raiding Apaches. At the end of the Spanish régime the Plains Indians were more powerful, far richer, and in control of more territory than they were at the beginning of it. The problem of subduing them had to be solved by another race.'³

Indeed, in the light of the usual denouement in the histories of anti-barbarian *limites*, it does not seem fanciful to imagine that, if the United States had not forcibly taken the problem out of Mexican hands in A.D. 1846-8, the year A.D. 1952 might have seen Mexico being ruled by the descendants of Apache and Comanche barbarian *conquistadores*, since it is hard to discern any indigenous social force within Mexico itself which would have been powerful enough to keep these now formidable transfrontier barbarians at bay after the fall, in A.D. 1820, of a Spanish Viceroyalty of New Spain that had provided the Mexic World with its universal state.

How was it that, in the course of the three centuries of Spanish rule over the Mexic World, the Plains Indians had become a serious danger to the sedentary society whose domain adjoined the southern edge of theirs, instead of remaining the mere nuisance to the north-westernmost Mexic agricultural pueblos that they had been before the Spaniards' advent? The answer to this question is that these barbarians in this one section of North America had rendered themselves formidable by the means by which so many of their counterparts in the Old World had made their fortunes. They had adopted one of the weapons introduced by their assailants and had adapted this weapon to their own *terrain* with a local efficiency which the wardens of the intrusive civilization's *limes* had proved unable to emulate. The Spanish authorities' task on the frontier of the Mexic World over against the Great Plains had become 'eventually impossible owing to the fact that the Indians learned to use horses';⁴ and, in the chapter of the present Study to which this Annex attaches,⁵ we have observed⁶ that this was a repetition, in North America, of the Arab barbarian Nomads' adoption of the same animate weapon, on the eve of the Primitive Muslim Arab conquests, from the civilizations occupying the adjoining 'Fertile Crescent'; of the Berber barbarian Nomads' previous adoption of the camel from Arabia via Egypt; and of the Arya barbarian Nomads' earlier adoption of the chariot from

the Sumeric World on the eve of their descent upon the Indus Basin and South-West Asia in the eighteenth or seventeenth century B.C.

In order to appreciate the revolutionary increase in the Plains Indians' power which was the consequence of their acquisition of the horse from Spanish trespassers on the southern fringe of their domain, it must be borne in mind that the Great Plains were a North American equivalent of the Great Eurasian Steppe. The North American prairie extended north-north-westwards, in the same general direction as the Rocky Mountains which bounded it on the west, from the north coast of the Gulf of Mexico, between the east bank of the Lower Rio Grande and the western limit of the timbered eastern half of Texas, right into the southern sections of what were eventually to be the two Canadian provinces of Alberta and Saskatchewan; and this huge expanse of open grass-land shared with the Eurasian and Afrasian steppes the property of having a higher social 'conductivity' than any other physical medium of human intercourse except the Sea. Before the introduction of the horse, this conductivity of the prairie had made it possible for eleven Nomad hunting tribes¹ to make their living there, but at the same time the poverty of their pre-equine equipment had set narrow limits to their exploitation of the prairie's latent resources for human purposes.

The Plains Indians might never have been able to make themselves at home on the Plains at all if, in a pre-Columbian Age, the conductivity of the Plains had not propagated two implements all over the Plains when once the diffusion of these implements had carried them to the Plains' north-western edge. One of these instruments was a domesticated animal: the sled-dog,² presumably borrowed originally from the Esquimaux, which had provided the Plains Indians with a means of transportation. The other implement was the composite bow:³ a potent weapon which had presumably come to the North American Plains from as far afield as the Great Eurasian Steppe, where it had been one of the characteristic weapons of the Eurasian Nomad herdsmen. The possession of these two implements had enabled the eleven tribes to make a living on the Great Plains by hunting the two great herds of buffalo with which they shared this habitat; but, while the composite bow was an effective weapon for warfare as well as for hunting, the dog-sled, transferred to a grass-surface from an ice-surface, was an inadequate means of transportation. In the horse, which spread over the Plains from the south-east as the sled-dog and the composite bow had spread over them from the north-west,⁴ the Plains Indians suddenly acquired a means of transportation that was ideal for their habitat, and, in the act, they as suddenly became for the first time fully masters of the prairie for the twin purposes of hunting the buffalo and making war on their fellow men.

'The student of social origins and institutions would like to put his finger on the exact spot where the Spanish explorer's horses (mares and stallions, for gelding was not then practised) broke their tethers and rushed away into the wild country. Perhaps the horses were stamped by Indians

⁴ See Webb, *op. cit.*, p. 57.

or by herds of buffalo; but it is more than likely that some were set free because they became too poor or footsore or crippled to be of further use to their masters. It is not remarkable that horses escaped; but it is remarkable that they survived, multiplied, and spread over the region west of the Mississippi and Missouri rivers. Not only did they spread as beasts of burden for the Plains Indians, but they grew wild in vast herds, proving that they had found a natural home. It is generally accepted by anthropologists that these herds originated from the horses lost or abandoned by de Soto about A.D. 1541. Whether they came from de Soto's horses or from those of Coronado or from other explorers is not material; we know that the Kiowa and Missouri Indians were mounted by A.D. 1682; [the Kiowa-Apache, by A.D. 1684;]¹ the Pawnee, by A.D. 1700; the Comanche by A.D. 1714; the Plains Cree and Arikara by A.D. 1738; the Assiniboin, Crow, Mandan, Snake, and Teton, by A.D. 1742; and the most northern tribe, the Sarsi, by A.D. 1784.²

'It was indeed a momentous event when a Plains Indian, half afraid and uncertain, threw his leg for the first time across the back of a Spanish horse and found himself borne along over the grassy plain with an ease and speed he had never dreamed possible of attaining. . . . From that time, slowly and by degrees, he worked out his technique. . . . His world was enlarged and beautified, and his courage, never lacking, expanded with his horizon and his power. God save his enemies!'³

The Plains Indians' Mexican enemies were saved by falling into the hands of the Americans instead of the Apaches. In the sweeping annexations, made by the United States in A.D. 1848, of vast tracts of juridically Mexican territory in which Mexican sovereignty had been effective only at a few widely scattered points, the victorious aggressor Power was inadvertently taking over responsibility for an anti-barbarian frontier, along the southern edge of the Great Plains, which the Republic of Mexico's predecessor, the Spanish Viceroyalty of New Spain, had inherited, some three hundred years and more before that date, from the Aztec builders of a Mexic universal state whose work the Spaniards had completed. Meanwhile, on the eastern edge of the Great Plains, adjoining the wooded eastern section of North America that had been effectively occupied by American planters and farmers, the United States had already committed itself to the very policy of establishing a permanent *limes*, over against the Plains Indians, which by this time had been discredited on the southern edge of the Plains by the failure of a corresponding Spanish experiment there;⁴ and, while this American repetition of a Spanish mistake was in train, Jefferson Davis capped de Soto's or Coronado's feat of presenting the Plains Indians with the horse that had once made the fortune of the Arabs by doing his best to endow them with the further gift of the camel, which had once made the fortune of the Berbers.⁵

³ Ibid., pp. 115-16.

⁴ Accounts of the United States Government's attempt to establish a permanent *limes* along the eastern edge of the Great Plains between A.D. 1823 and A.D. 1840, and of the breakdown of this policy between A.D. 1851 and A.D. 1861, will be found in Paxson, op. cit., chaps. 31 and 46; in Billington, op. cit., pp. 468-73 and 653-4; and in Macleod, W. C.: *The American Indian Frontier* (London 1928, Kegan Paul), chaps. 30 and 31.

⁵ A brief account of this entertaining incident will be found in Webb, op. cit., pp. 199-200.

Under the influence of the picture of the Plains as an inhospitable desert which had been given currency, in the course of the first two decades of the nineteenth century, in a series of reports by American explorers, culminating in Major Long's report on his expedition in A.D. 1820,¹ a proposal had been made in A.D. 1823 by John C. Calhoun, at that time Secretary of War at Washington, for permanently segregating, within the political domain of the United States, an area that was still to be left open for settlement by American farmers from an area that was henceforth to be reserved for occupation by the Indian peoples. The dividing line was to be drawn approximately at the ninety-fifth meridian, which coincided more or less with the borderline between the eastern woodlands and the western prairie. Indian peoples living east of this line—including 'the five civilised nations' in the South-Eastern United States—were to be induced or compelled to move to the west of the line in consideration of their being guaranteed the permanent possession of new lands there, while the Plains Indians were to be induced to make room for these Indian newcomers from the East in consideration of their being guaranteed the permanent occupation of the rest of their hunting-grounds west of the line. The security of title with which the Indians of both provenances were thus to be invested was to be the first step towards reclaiming them for Civilization.

'The great object to be accomplished,' wrote President Monroe in recommending Calhoun's proposal to Congress on the 27th January, 1825, 'is the removal of these tribes to the territory designated . . . conveying to each tribe a good title to an adequate portion of land . . . by providing . . . a system of internal government . . . and, by the regular progress of improvement and civilisation, prevent . . . degeneracy.'²

This proposal was duly carried out in the course of the next fifteen years.

'The approval of Congress was given. A group of treaties made with the western Indians in A.D. 1825 gave a sort of pledge that was followed up by specific laws of 1828 and 1830, in which the policy of [Indian] colonisation was described as an accepted thing. In A.D. 1832 Congress recognised its responsibility to the [Indian] emigrants and created a Bureau of Indian Affairs in the War Department, under a Commissioner whose duty was to care for the Indian wards. Two years later, the great charter of the frontier Indians was enacted in the Indian Intercourse Act, which forbade any White person, without licence from the Indian Commissioner, to set foot in the Indian Country. . . . Schools were promised, to teach the Indians letters and trades. In some cases blacksmiths and other artisans were to be maintained by the United States. There was a serious attempt to carry out the suggestion that, once the tribes had been shifted to their final place of residence, they must be lifted to a higher scale of civilization by the Government of the United States. . . . By the end of A.D. 1840 most of the tribes had been removed to the frontier, the Indian Country was solid, and the administrative details of the arrangement were complete. The American citizen, by his own enactment, no longer possessed a right to advance his settlements towards the West.'³

¹ See pp. 634-5, above.

² Paxson, *op. cit.*, pp. 277-8 and 284.

³ Quoted in Paxson, *op. cit.*, p. 277.

The military implications of this would-be permanent political settlement were clearly recognized. A chain of forts had been built along the western border of the area already settled by American farmers as early as A.D. 1816-27.¹

'The Secretary of War in A.D. 1837 recommended "a chain of permanent fortresses . . . and a competent organisation of the militia of the frontier states" as the best means of maintaining the peace. . . . The commander of the army in the West, General E. P. Gaines, recommended in A.D. 1838 that the cordon of military posts along the Border be built of stone, to outlast the century at least. . . . [Actually,] while the Indian frontier lasted, the defence of the frontier settlements was entrusted to moving bodies of United States troops, to a regiment of mounted dragoons that were enlisted early in the 'thirties, and to the militia.'²

This policy of freezing the western frontier of American agricultural settlement along the borderline between the woodlands and the prairie was maintained for more than thirty years. The first inroad upon it was made in A.D. 1851, when the Sioux and other Plains Indians were cajoled by the United States authorities into consenting, in negotiations conducted that summer at Fort Laramie, to a limitation of their ranges within the area that had previously been guaranteed to them as their permanent domain;³ and 'in the summer of A.D. 1854 the first land office in the Indian Country was opened across the Border from Missouri, to retail to settlers the tribal lands that had been dedicated to perpetual Indian use'.⁴ Yet, 'as late as A.D. 1853, the Commissioner of Indian Affairs' had 'reported that there was no serious encroachment of squatters upon the lands of his wards west of Iowa and Missouri';⁵ and the policy that had been inaugurated by the United States Secretary of War, J. C. Calhoun, in A.D. 1823 was still being pursued by one of his successors, Jefferson Davis, in A.D. 1853-7.⁶

The first premiss on which Davis founded his policy for the frontier was the assumption, traditional in the United States since the eighteenth century, that the Great Plains were irreclaimable. He referred to them as 'that unpopulated desert . . . which, I believe, is, the most of it, to be unpopulated for ever'.⁷ From this first premiss it followed that there could be no question of abandoning President Monroe's policy of maintaining a permanent military frontier between the American planters' and farmers' country in the woodlands to the east of the hundredth meridian and the Indian hunting-tribes' country on the prairie to the west of the same line. The technical military innovations which Davis advocated were all concerned merely with the location of the *lines* and the disposition, type, and equipment of the troops by whom it was to be held. He proposed to replace the existing chain of numerous small and scattered American military posts, thrown out into the fringe of a prairie on which the frontier of American agricultural settlement had not caught up with them, by a small number of strong garrisons that were to be located much farther to the rear, within the already settled and

cultivated area. The forward zone, from which the existing posts were to be withdrawn, was to be dominated intermittently by sending out strong patrolling expeditions into it during the season when there would be grass there to provide fodder for cavalry horses and baggage animals.

In recording Davis' proposals, Webb points out¹ 'that Davis was advocating a policy very similar to that proposed by Rubí in his report advocating a reorganisation of the Spanish policy on the southern border of the Great Plains'. A student of the frontier policy of the Roman Empire will discern in Davis' proposal the familiar transition from an Augustan policy of holding a single continuous brittle forward line to a Diocletianic policy of defence in depth through a war of movement, with provision for more adequate reserves than the Augustan system had allowed.² The inference is that, by a date at which the United States' *limes* along the eastern edge of the Great Plains had been in existence for some thirty years, the defence, here too, was beginning to be subjected to a strain through the operation of the 'law' that, on a stationary military frontier between a civilization and barbarians, Time tells in the barbarians' favour; and the increases in both the cost and the difficulty of maintaining the American *limes* were, in fact, the grounds explicitly put forward by Davis himself for the technical changes that he was suggesting. He had found that the existing 'garrisons were small and weak, and the soldiers poorly paid and dispirited'.³ The inability of troops dispersed among numerous small forward posts 'to pursue and punish' offending Indian war-bands, which had been committing depredations almost under their noses, had 'tended to bring into disrepute the power and energy of the United States'.⁴

The truth was that, by the eighteen-fifties, the Plains Indians had made themselves into fighting men whose efficiency was formidable not merely for a Republic of Mexico, but even for a Power of the contemporary calibre of the United States; for, in mounting the Spaniard's horse, the Plains Indian had not left the Scythian's composite bow lying idle on the ground. He had converted himself not merely into an expert horseman but into an expert horse-archer in the Parthian style; and the horse-archer who had thus been reborn in the New World was more than a match for the dragoon from the West European extremity of the Old World whose weapon—a pair of horse-pistols—had given the most recent demonstration of its inefficiency at Waterloo. When, in the eighteen-twenties, the American pioneers in Eastern Texas came within close enough range of the western plains to provoke Comanche raids upon them,

'in most respects the Indian had the best of it. In the first place the Texan carried at most three shots; the Comanche carried twoscore or more arrows. It took the Texan a minute to reload his weapon; the Indian could in that time ride three hundred yards and discharge twenty arrows. The Texan had to dismount in order to use his rifle effectively at all, and it was his most reliable weapon; the Indian remained mounted throughout the combat.'⁵

An officer of the United States Army, in a book published as late as A.D. 1866,¹ still found it necessary to explain to his readers that 'the modern schools of military science are but illy suited to carrying on a warfare with the wild tribes of the Plains' and that the horse-Indians' 'tactics are such as to render the old system almost wholly impotent'.

It is true that the Industrial Revolution, which was eventually to provide the American farmer with the appropriate tools for bringing the prairie under the plough, first came to the American soldier's rescue by providing him with an appropriate weapon for fighting the prairie Indian horse-archer. The six-shooter revolver invented by Samuel Colt of Boston was in use among the Texan Rangers before A.D. 1840.²

'The six-shooter . . . stands as the first mechanical adaptation made by the American people when they emerged from the timber and met a set of new needs in the open country of the Great Plains. It enabled the White Man to fight the Plains Indian on horseback.'³

Yet the equipment of American cavalrymen with the revolver was not the end of the armaments race between the Plains Indian and the West European invaders of North America which had begun when the Indian had acquired the Spanish cavalryman's horse; for the transfer of the military ascendancy from the Indian to the American horseman, which was the first effect of the advent of the revolver, was only temporary.

'The revolver . . . multiplied every soldier by six and produced such an inspiring moral effect on the troops, and so entirely depressing an effect on the Indians, that the fights became simply chases—the soldiers attacking, with perfect surety of success, ten or twenty times their numbers. [But] after some years the Indians began to obtain and use revolvers, and the fighting became more equal. It remained, however, for the breech-loading rifle and metallic cartridges to transform the Plains Indian from an insignificant, scarcely dangerous, adversary into as magnificent a soldier as the World can show. Already a perfect horseman, and accustomed all his life to the use of arms on horseback, all [that] he needed was an accurate weapon which could be easily and rapidly loaded while at full speed.'⁴

This passage, recording the personal experience of an American officer who had himself seen active service on the Indian frontier in the last chapter of this frontier's history, brings out the point that, down to the eve of the date at which the Plains Indians were crushed and corralled once for all by their American adversaries, their military efficiency and prowess continued to increase in a geometrical progression through their practice of the transfrontier barbarians' master-art of borrowing the enemy civilization's weapons and then turning them to better account by adapting their use to the nature of a local *terrain* on which the barbarian is at home while the pioneer of the intrusive civilization is out of his element there. The book from which this passage has been quoted was published in A.D. 1882, some six years after the campaigning season

¹ Marcy, R. B.: *Thirty Years of Army Life on the Border* (New York 1866, Harper), pp. 67 ff., quoted in Webb, op. cit., p. 196, n. 1.

of A.D. 1876, which had been signalized, in the annals of the warfare between the United States and the Sioux, both by the final débâcle of this barbarian war-band and by its previous infliction on the United States Army of the most grievous reverse ever suffered by United States troops at Indian hands.¹ The explanation of Sitting Bull's swan-song victory over Custer is made clear by Colonel Dodge:²

'That he [the American soldier] can still contend with the Indian on anything like equal terms is his highest commendation; for the Indian is his superior in every soldierlike quality except subordination to discipline and indomitable courage.'

If this verdict on the comparative military qualities of the United States Army and the Plains Indians in the eighteen-seventies is as just an appreciation as it would have been, supposing that it had been pronounced, apropos of the Roman Army and the Goths, by Ammianus Marcellinus, it does indeed go far towards explaining how it came to pass that in A.D. 1876 the United States Army suffered, in miniature, a disaster as deadly as the Roman catastrophe at Adrianople in A.D. 378; but we have then still to find the explanation of the extreme difference between the respective sequels to two episodes of military history that appear to run parallel up to this point. The victory of the Goths at Adrianople on the 9th August, 378, was the prelude to a sweeping barbarian conquest of half the Roman Empire, whereas the victory of the Sioux on the Little Big Horn on the 25th June, 1876, was the prelude to a decisive collapse of the barbarian victors.³ The explanation of this diversity in the outcome is not to be found simply in an industrialized Western Society's fertility in spawning ever more lethal new-fangled mechanical weapons, considering that each new weapon of the kind was successively acquired, and turned to still better account on barbarian *terrain*, by the Western Civilization's Indian opponents on the North American Great Plains. The ultimate reason why the transfrontier barbarian who had triumphed over the Roman Empire in the Old World and had worsted the Spanish Empire and its Mexican successor-state in North America was eventually overwhelmed in North America by the United States was not because of the superiority of the American people in mechanical equipment but because of their numbers and, perhaps even more, their enterprise.

Before the last round in the warfare between the Americans and the Plains Indians was fought out to a decisive conclusion in the Americans' favour in the course of the years A.D. 1861-76, the Plains Indians had been outmanœuvred in advance through being encircled by their American assailants, as the Eurasian Nomad herdsmen who were crushed by the Russians and the Manchus in the course of the eighteenth and nineteenth centuries of the Christian Era had previously been encircled by these two sedentary Powers when the Russian and Manchu outposts had collided with one another in the seventeenth century in the Amur

¹ See Billington, *op. cit.*, p. 666.

² Quoted in Webb, *op. cit.*, p. 175, n. 2.

³ The details of the last convulsions of Indian resistance on the Plains between A.D. 1876 and A.D. 1890 will be found in Billington, *op. cit.*, pp. 666-7. The accompanying religious phenomena have been noticed in the present study in V. v. 329-32.

Basin.¹ And, like the seventeenth-century Russo-Manchu feat of encircling the Eurasian Nomads, the nineteenth-century American feat of encircling the North American Plains Indians was achieved with no better weapons than de Soto's or Coronado's, and with no better means of transportation than Alexander's, Caesar's, or Napoleon's.

Like the contemporary South African pioneers who were trekking northward across the Orange River into the heart of Africa, the American pioneers who traversed the Great Plains of North America in the course of the years A.D. 1821-49 were armed only with non-repeating fire-arms, and were equipped, at the best, with 'covered wagons' of the kind in which the Goths had made their transit from the Baltic to the Black Sea coast of the Eurasian Continent in the early centuries of the Christian Era, and the Philistines' theirs from the Aegean coast of Anatolia to the eastern approaches to Egypt in the early years of the twelfth century B.C. Indeed, the nineteenth-century American pioneers reckoned it a triumph when they succeeded in finding a way for the passage of these immemorially old 'houses on wheels' which not only made the journey physically practicable for children, women, sick persons, and household goods, as well as for able-bodied men, but also made it possible to protect the caravans against attack by Indians behind the rampart of a wagon-lager.² In some of the earliest of their treks across the Plains into the Far West, the American pioneers failed to manœuvre their wagons through the mountains and were compelled to finish the journey with pack-horses. In the summer of A.D. 1856 a party of five hundred men, women, and children actually made their way over the twelve hundred miles of trail from Iowa City to Salt Lake City pushing a hundred two-wheeled hand-carts!³

The trans-Plains pioneers were no doubt eventually assisted in arriving at their jumping-off places at the western edge of the eastern timbered country by the gradual development of mechanical transportation, in the shape of river-steamships and railroads, in their rear. Yet the first sod was not turned for the construction of the Baltimore and Ohio Railroad till A.D. 1828,⁴ seven years after the first wagon caravans had made their way across the Plains from Missouri to Santa Fé; the Baltimore and Ohio Railroad did not reach the Ohio River till A.D. 1852; and 'it was five years more before there was a continuation west of the Ohio to Cincinnati and St. Louis'.⁵ Thus the trans-Plains West had already been won by the pioneers before railhead had reached their jumping-off places on the western border of the State of Missouri at the eastern edge of the prairie. Work on a transcontinental railroad was not started till A.D. 1863—when, significantly, the first start was made at the Far Western end, from west to east, and not from east to west at the westernmost railhead in the Mississippi Basin—and the through-track from coast to coast was not completed till May 1869, in the year following the campaigning season in which the United States Army had broken the back of the Plains Indians' resistance.

⁵ *Ibid.*, p. 405.

What was it that moved the American people, without waiting for the weapons and tools that the Industrial Revolution was forging for them, thus to encircle the Plains Indians by breaking out of the United States Government's artificial *limes* along the western verge of the timbered country and pushing across the prairie and over the mountains to a natural frontier at the Pacific coast? For half a century and more, running from about A.D. 1820, the American people believed, as unquestioningly as the United States Government, that the Great Plains were permanently irreclaimable for agriculture. What prompted the people to reply to the challenge of this apparent barrier across their path by making a response that, unlike their Government's response, was positive, not negative? While the Government was trying to establish a permanent military frontier along the eastern edge of the Plains, pioneer American traders, farmers, and miners were pushing their adventurous way right across the Plains in the hope of finding—not on them, but beyond them—a fresh land of promise which would equal, and perhaps surpass, the timbered eastern section of the United States which by this time they had already colonized.

This daring leap of the American pioneers across the prairie in the nineteenth century of the Christian Era is reminiscent of the leap across the Great Western Bay of the Eurasian Steppe that was made in the tenth century by missionaries from the Oxus-Jaxartes Basin who converted Great Bulgaria to Islam and by rival missionaries from Constantinople who converted Russia to Eastern Orthodox Christianity. But the driving force that gave an irresistible impetus to the American pioneers' trek across two-thirds of the breadth of the great North American island from the western edge of the eastern timbered country all the way to the Pacific coast was not that concern for the salvation of souls which had previously carried the Jesuit missionaries to California from Mexico; it was the mounting pressure of an American population, east of the *limes*, that was now being reinforced by the rapidly increasing population of a nineteenth-century Western Europe.

"The whole population of the United States rose from 9,638,453 in A.D. 1820 to 17,069,453 in A.D. 1840. Of this increase of almost seven and a half millions, more than four millions were to be found in the states and territories west of the Appalachian Mountains. The total western population was about 6,300,000, . . . and this total was nearly 200 per cent more than it had been in A.D. 1820. The whole United States increased about 80 per cent in twenty years. The eastern states, even with the help of their frontier elements, increased only some sixty per cent in the same period."¹

The pressure of this potent head of population mounting up against the inner face of the United States Government's *limes* was the force that catapulted the pioneers—by sheer muscle-power without mechanical aids—right across the Plains to the western mountains, and, over these, to the Pacific, between the years A.D. 1821 and 1849.

This abundance of man-power, working together with a contemporary release of the United States from political and military entanglements

¹ Paxson, *op. cit.*, pp. 286-7.

overseas, perhaps suffices to explain the contrast between the Americans' triumphant nineteenth-century response to the challenge of the Great Plains and the Spaniards' previous dismal failure. Even after the Spaniards had established themselves in Texas, on the opposite fringe of the Great Plains to New Mexico, in A.D. 1716-18,¹

'if a Spaniard wanted to go from San Antonio [in Texas] to Santa Fé [in New Mexico], he did not make a direct journey across the Great Plains: he took the Camino Real, went south to Durango, then turned west and north and skirted the mountains until he came to Santa Fé. He went hundreds of miles out of the direct way, thus avoiding the open Plains country.'²

In the event, a trail across the Great Plains to Santa Fé in New Mexico from the timbered eastern section of North America was opened up, not from Texas, but from Missouri.

The news that Mexico had thrown off Spanish sovereignty in A.D. 1820 was promptly followed up by the arrival at Santa Fé, in A.D. 1821, of no fewer than three rival American caravans, racing one another to be the first in the New Mexican market;³ and the arrival of a single great organized American caravan from Independence, Missouri, was an annual event at Santa Fé during the years A.D. 1830-44.⁴ The American occupation of Oregon, which had been begun by seamen sailing round Cape Horn, was confirmed by a north-westward overland trek across the Great Plains which was first achieved in A.D. 1832⁵ and which was consummated in A.D. 1843, when for the first time wagons went all the way.⁶ The first overland trek from Kansas to California was made in A.D. 1841,⁷ and in A.D. 1844 wagons went all the way on this trail likewise.⁸ The Mormons made their trek from Iowa to Utah, right across the middle zone of the Plains, in A.D. 1847, and in A.D. 1849 the 'Gold Rush' to California was made overland across the Plains, as well as by the more circuitous maritime route round Cape Horn. The first coach travelled from Tipton, Missouri, to San Francisco on the 15th September-10th October, 1858.⁹

These divers transits of the Great Plains from the Eastern United States to the Rocky Mountains, and beyond these to the Pacific Coast, between A.D. 1821 and A.D. 1859,¹⁰ all occurred during a period when, as we have observed, it was the United States Government's official policy to maintain, *more Hispanico*, a permanent *límite* along the borderline, east of Meridian 98°, between the woodland and the prairie; and there was an inconsistency between policy and practice that was fraught with eventual trouble; for these widely ramifying and rapidly multiplying American trespasses on the hunting grounds of the Plains Indians were provocative, and 'the discovery of gold in the Pike's Peak country touched off the inevitable conflict. A hundred thousand miners crossed the Plains in

1859, elbowed their way into Cheyenne and Arapaho lands, and drove the Indians from their homes. Resentment bred of those outrages was infectious,¹ and the sequel was the series of wars between the Plains Indians and the United States Army which went on from A.D. 1861 to A.D. 1876. These wars ended, as we have seen, in the Indians being defeated on the battlefield and being corralled in reservations; in other words, they ended in the abandonment, after a forty years' trial, of the policy of maintaining a *limes* at the eastern edge of the Great Plains. But the denouement which thus liquidated the United States' *limes* along the eastern edge of the prairie was, of course, the opposite of the classical denouement along artificial *limites* between civilizations and barbarians. The catastrophe that eventually turned the *limes* here into a superfluous anachronism was not the collapse of the Power that had established it; it was the crushing of the transfrontier barbarians against whom it had been designed as a defence for the society that had been domiciled on the inner side of it.

The United States' Army's victory over the Plains Indians in the warfare of A.D. 1861-76 was conclusive because, by this time, the Army's military striking power was being reinforced by the impetus of an expanding population that was now pressing in upon the Great Plains from the Far West as well as from the East. The military decision was clinched on the economic plane by the extermination, between A.D. 1867 and A.D. 1883, of the game on which the Plains Indians had lived as parasites. The discovery in A.D. 1871 of a profitable commercial use for buffalo hides led to an annual slaughter, at the rate of three million victims a year, over the years 1872-4; the Great Southern Herd was extinct by A.D. 1878, the Great Northern Herd by A.D. 1883; and by A.D. 1903 no more than thirty-four living specimens were to be found of a species which had probably been represented on the Plains by about thirteen million head before the advent of the rifle.² This destruction of the non-human, as well as the human, fauna that had tenanted the Great Plains hitherto left the American people in command of the solitude that they had made; but the eviction of the previous pre-Columbian tenants had not settled the question how the new occupants of Transatlantic provenance would utilize their tardily acquired prairie estate.

The American farmer was not to bring the Great Plains under the plough till he had followed up the United States' Army's conclusive victory over the Plains Indian Nomad hunting tribes by fighting, on the morrow of the overt Civil War of A.D. 1861-5, an undeclared civil war in which the opposing parties were neither the North versus the South nor the farmer versus the planter but the sedentary tiller of the ground versus the Nomad keeper of livestock.³ After farmer Cain had rid himself of hunter Nimrod,⁴ he had still to settle accounts with herdsman Abel; and in North America, as in the Old World, the struggle for life between Cain and Abel was as savage as the stakes were high. Even before the Plains Indian and the buffalo had disappeared from the scene, the contest for possession of the Great Plains of North America

⁴ Gen. x. 9.

was already being fought out between an American farmer with the traditions of some six to ten thousand years of husbandry behind him and an American avatar of the Eurasian Nomad herdsman who, in A.D. 1866, sprang fully armed from the dragon's-tooth seed which the Civil War of A.D. 1861-5 had sown in the pastures of the Nueces Valley at the southernmost extremity of the Great Plains on the Gulf Coast of Western Texas.

This economic and social conflict between an American Cain, branded with the mark of his Transatlantic provenance, and an American Abel, who had made a dramatic second epiphany in a New World, lasted four times as long as the military Civil War to which it was an epilogue; for, though the American farmer, with the aid of the American industrialist, succeeded in making an effective lodgement on the Great Plains in the course of the eighteen-seventies, the American cowboy had anticipated him by spreading all over the Plains between A.D. 1866 and A.D. 1880,¹ and it was not till after the speculative boom of A.D. 1880-5 in the cattle industry had precipitated the crash of A.D. 1885-7,² and till after the shepherd had made a half-hearted attempt to elbow his way in,³ that the farmer found himself relieved of his competitor the herdsman thanks to Abel's follies and misfortunes rather than to Cain's own prowess. Even then, when the farmer's successive human rivals in the fight for possession of the Great Plains of North America had all passed away, Cain's acquisition of the disputed territory was by no means assured; for the Indian hunter, Texan cowboy, and Far Western shepherd had none of them been such formidable adversaries as Physical Nature was to show herself to be; and in A.D. 1952 it still remained to be seen whether the Great Plains would prove permanently amenable to Cain's high-handed attempt, with the aid of his offspring Tubal-Cain the artificer,⁴ to annex these dry grasslands to Ceres' empire.

Whatever the ultimate destiny of Agriculture on the Great Plains might be, there was no indication in the sixth decade of the twentieth century of the Christian Era that Cain's discomfited pastoral rival was likely to try conclusions with him here again. In the economic and social history of the United States the rise and fall of 'the Cattle Kingdom' had been no more than a brilliant flash in the trigger-pan;⁵ yet, for a student of the geneses of civilizations, the amply recorded history of an abortive pastoral civilization in North America which had come and gone between A.D. 1866 and A.D. 1887 was an episode of surpassing interest in so far as it provided authentic materials for reconstructing, by analogy, the lost history of the genesis, round about the turn of the third and second millennia B.C., of a pastoral civilization on the Eurasian Steppe which had had a subsequent life-span of some four thousand years' duration—in the course of which it had produced momentous effects on the histories of all its sedentary neighbours.

In the abortive yet none the less illuminating nineteenth-century

¹ See Billington, *op. cit.*, p. 679.

² See *ibid.*, pp. 683-6.

³ See *ibid.*, p. 687.

⁴ Gen. iv. 22.

⁵ Accounts of this episode in the history of the United States will be found in Paxson, *op. cit.*, chap. 56; Webb, *op. cit.*, chap. 6; Billington, *op. cit.*, chap. 33.

North American instance an historian could watch the process by which, in the Nueces Valley, a composite society, in which human beings, horses, and cattle were co-operating with one another, under human management, to make a living off an uncultivated grassland,¹ came into existence as an economic and social appendage to a neighbouring sedentary agricultural society² and then suddenly made what was tantamount to a declaration of economic and social independence by taking the whole vast prairie for its realm³ and claiming to deal, on terms of equality, with agricultural neighbours to whose economy 'the Cattle Kingdom' had previously been subsidiary. This significant passage of history on the southernmost sector of the borderland between the eastern woodland and the western prairie in North America offered an insight into the process through which some sector of the borderland between the Desert and the Sown in the Old World—perhaps the fringes of the oasis 'of Anau in Transcaspia—had once given birth to a Nomad pastoral society which had then proceeded to propagate itself over the entire Eurasian Steppe—as rapidly, for all that we know, as the nineteenth-century North American 'Cattle Kingdom' spread northwards over the Great Plains from the Nueces Valley into Canada between A.D. 1866 and A.D. 1880.

Even the fratricidal warfare between Cain and Abel, which had played so large a part in the histories of the civilizations of the Old World for not much less than four thousand years, was rekindled in North America during the twenty years for which the North American 'Cattle Kingdom' lasted; and in the New World, as in the Old World, Cain took upon his head the guilt of playing the part of the aggressor. As recently as A.D. 1865 the farmers of Western Missouri had, at least in sympathy if not in action,⁴ been on the same side as the cowboys of South-Western Texas in a fierce civil war between a Southern Confederacy and a Union from which it was striving to secede. Yet in A.D. 1866, when the Texan cowboys, on the first of their annual northward cattle-drives, were bearing down upon railhead at Sedalia, within the limits of cultivation in Western Missouri, they were attacked and robbed by 'embattled farmers' who, the year before, had been, at least in spirit, their fellow Confederates.⁵ 'Ferocious Plains Indians . . . were to be preferred to the Missourians';⁶ for the feud between South and North on the political surface of life did not avail, even in the year following the date of the Confederacy's overthrow, to maintain the solidarity of the South against the disruptive effect of a more ancient feud between Cain and Abel that had suddenly erupted from a source deep down in the abyss of a Collective Subconscious Psyche with a violence almost equal to that of the still more ancient feud between Cain and Nimrod.

¹ See III. iii. 10 and 13-14 for this feature in the organization of the Nomad pastoral societies of the Old World.

² Cp. III. iii. 10-11.

³ Cp. III. iii. 11-13.

⁴ Missouri was one of the border slave-states that had failed to secede from the Union in A.D. 1861; but the hearts of perhaps a majority of her population had been on the Southern side throughout the Civil War of A.D. 1861-5.

⁶ Webb, *op. cit.*, p. 219.

VIII. D, ANNEX

'THE MONSTROUS REGIMENT OF WOMEN'¹

THE Heroic Age might have been expected to be a masculine age *par excellence*. Does not the evidence convict it of having been an age of brute force? And, when force is given a free rein, what chance can women have of holding their own against the physically dominant sex? This *a priori* logic is confuted by the facts; for the facts show that this Heroic Age of unbridled adolescent barbarism can challenge comparison with a Matriarchal Age of primitive agriculture and with a Shorthand-typist Age of elderly business organization as an age in which women were in the ascendant. Let us survey these paradoxical facts before we try to discover the explanation of them.

In the Heroic Age the great catastrophes are apt to be women's work, even when the woman's role is ostensibly passive. If Alboin's unsatisfied desire for Rosamund was the cause of the extermination of the Gepidae, it is credible that the sacking of Troy was provoked by the satisfaction of Paris' desire for Helen,² and that Haethcyn brought disaster on himself by carrying off a Swedish Queen.³ More commonly the women are undisguisedly the mischief-makers whose malice drives the heroes into slaying one another. The legendary quarrel at Worms between Brunhild and Kriemhild, which eventually discharged itself in the slaughter in Etzel's Danubian hall, has its Icelandic counterpart in Hallgerda's quarrel with Bergthora which eventually resulted in Njal's house being burnt over his head; and, though, in the saga as well as in the epic, the maker's art has spun fiction out of fact, we may assume that the fiction has commended itself because it is true to life.⁴ It is indeed all of one piece with the authentic incidents of the historical quarrel between the legendary Brunhild's nobly ferocious namesake⁵ and her basely ferocious enemy Fredegund, which cost the Merovingian successor-state of the Roman Empire forty years of civil war.⁶

¹ *The First Blast of the Trumpet against the Monstrous Regiment of Women* is the title of a pamphlet published by John Knox in A.D. 1558.

² The legendary Trojan War is presented by Herodotus (Book I, chap. 5) as the first round in a thenceforth perennial warfare between Hellenes and Orientals which is the plot of his historical drama, while the Rape of Helen, which was the Trojan War's legendary cause, was, according to him (Book I, chaps. 1-4), the fourth of a series of incidents of the kind, in which Io, Europa, and Medea had been Helen's predecessors (see pp. 454-7, above). The Orientals had started this series of abductions by carrying off Io, but the Hellenes had been the first to commit the criminal folly of making an abduction a *casus belli*. 'To abduct women was a crime, but to take their abduction seriously enough to insist on reprisals was a folly, since it was obvious that these women would not have got themselves abducted if they had not so desired' (Book I, chap. 4). In this satirical introduction to a work of genius the sophisticated Hellenic historian has wittily travestied one of the traditional motifs of a post-Minoan 'heroic' saga.

³ Beowulf, ll. 2930 ff., cited by H. M. Chadwick in *The Heroic Age* (Cambridge 1912, University Press), p. 337.

⁴ See I. i. 449-50.

⁵ An appreciation of the historical Brunhild's character will be found in Dill, S.: *Roman Society in Gaul in the Merovingian Age* (London 1926, Macmillan), pp. 172-3 and 232-4.

⁶ For the causes of the quarrel between Brunhild and Fredegund, to which this forty-years' war was the sequel, see p. 654, below.

'It is well to bear in mind the story of the war between the Angli and the Warni, a war which owed its origin to Radiger's repudiation of his marriage contract with the English King's sister. . . . This story comes, not from a poem, but from the work of a strictly contemporary Roman historian. . . . In the story of Radiger we see how a young princess was able to gather together a huge army and bring about a sanguinary struggle between two nations on account of an insult offered to her by a neighbouring king. Again, Paulus Diaconus¹ states that the war between the Heruli and the Langobardi was due to the murder of the Herulian King's brother by a Langobardic princess. Even if this story is untrue, it is significant enough that it should obtain credit. . . . According to Gregory of Tours² the overthrow of the Burgundian kingdom [in Savoy] was due to the instigation of Hrothhild, who implored her sons to exact vengeance for the murder of her parents—a case not unlike the Norse version of the story of Hamdhir and Sörlí. Hildeberht's invasion of Spain was undertaken in answer to messages from his sister Hlothhild, who had been ill-treated by her husband, the Visigothic King Amalaric.³ The dissensions which eventually brought about the downfall of the Thuringian kingdom had their origin in the proud and jealous character of Amalaberga, the wife of Irminfrith.⁴ Unless we are prepared to shut our eyes to the plain evidence of History, we are bound to recognise that the personal feelings of queens and princesses were among the very strongest of the factors by which the politics of the Heroic Age were governed.⁵

These words ring as true to Macedonian barbarian life in a post-Achaemenian heroic age as to Teutonic barbarian life in a post-Hellenic heroic age.

'It was in the character and action of the Seleucid and Ptolemaic queens that the Macedonian blood and tradition showed itself. Both dynasties exhibit a series of strong-willed, masculine, unscrupulous women of the same type as those who fought and intrigued for power in the old Macedonian Kingdom. The last Cleopatra of Egypt is the best known to us, but she was only a type of her class. There was no relegation of queens and princesses to the obscurity of a harem. They mingled in the political game as openly as the men. It was in the political sphere, rather than in that of sensual indulgence, that their passions lay and their crimes found a motive. Sometimes they went at the head of armies. . . . It is only in the intensity and recklessness with which they pursue their ends that we see any trace of womanhood left in them.'⁶

The influence of women over men in the Heroic Age had not, of course, been exhibited solely in the crudely malevolent practice of goading the men into fratricidal strife. No women had left deeper marks on history than Alexander's mother Olympias and Mu'awiyah's mother Hind, and these two viragos had immortalized themselves, not by their recorded deeds of passion and violence,⁷ but by their life-long moral

¹ See his *Historia Langobardorum*, Book I, chap. 20.

² See his *Historia Francorum*, Book III, chap. 6.

³ See *ibid.*, Book III, chap. 10.

⁴ Chadwick, *op. cit.*, pp. 337-8 and 372.

⁵ See *ibid.*, Book III, chap. 4.

⁶ Bevan, E. R.; *The House of Seleucus* (London 1902, Edward Arnold, 2 vols.), vol. ii, pp. 279-80.

⁷ Hind is reported to have bitten the liver of her slain enemy Hamzah's corpse on the battlefield of Uhud (Margoliouth, D. S.: *Mohammed and the Rise of Islam* (New York 1905, Putnam), p. 306). As for the deeds of Olympias, the charge-sheet was graven on

ascendancy over their redoubtable sons—an ascendancy that was not impaired by their separation from the husbands to whom these sons had been born by them. Mu'āwiyah always delighted in speaking of himself as 'the son of Hind', and used to put his mother at the head of the list when he was enumerating the glories of his family;¹ and Alexander, for his part, was at heart his mother's son, who had cloven to Olympias when her estrangement from Philip had come to an open breach—a resolution of psychological forces which is aptly symbolized in the myth that the hero was begotten on his mother, not by his legitimate human father, but by an imperious heavenly sire.²

After Alexander's premature death, Olympias entered the arena of Macedonian cut-throat politics as a principal and duly met her own death at the hands of as ruthless a criminal as herself in the person of Cassander. Zenobia, the widow of Odenathus prince of Palmyra, and 'Ā'ishah, the widow of the Prophet Muhammad and the daughter of his first *khalīfah* Abu Bakr, embarked on similar ventures without being made to pay for failure with their lives. Zenobia's life was spared by her grim conqueror Aurelian,³ even after she had repeated her attempt to carve a Palmyrene Arab barbarian successor-state out of the Roman Empire;⁴ and 'Ā'ishah was left in peace by her chivalrous conqueror 'Alī after he had defeated her in the one signal victory in his otherwise disappointing career.⁵ The death of the Seleucid Emperor Antiochus II, 'the god', was the signal for his rival widows, a Seleucid Laodice at Ephesus and a Lagid Berenice at Antioch, to plunge the Asiatic Macedonian successor-state of the Achaemenian Empire into civil strife which festered into an international war between the Seleucid and Ptolemaic Powers when Berenice's brother Ptolemy III Euergetes of Egypt took up arms to avenge his sister's death after she had been assassinated through the treachery of a trusted physician who was secretly in Laodice's service.⁶ The Merovingian successor-state of the Roman Empire in Gaul was similarly plunged into a civil war—which dragged on for forty years⁷—by two rival queens who did not wait for

the hearts of two men—Philip and Antipater—who, on this subject, found Alexander infatuatedly blind.

¹ Lammens, S. J., *Le Père H. : Études sur le Règne du Calife Omayyade Mo'āwīa Ier* (Paris 1908, Geuthner), p. 69. Cf. eundem: *La Mecque à la Veille de l'Hégire* (Bayrūt 1924, Imprimerie Catholique), p. 170. The spirit which captivated Hind's son is exemplified in her bearing towards Muhammad at the *levée* at which she found herself constrained to declare her allegiance to the conqueror after the capitulation of Mecca (see Margoliouth, *op. cit.*, p. 390), and in her trading venture, financed with money borrowed from the public treasury by leave of the Caliph 'Umar, after she had been divorced by her husband Abu Sufyān (see Lammens, *op. cit.*, pp. 169-70).

² See V. vi. 267-8.

³ Aurelian's death-warrant was addressed, not to Zenobia, but to her male academician Longinus.

⁴ The successor-state that Zenobia did momentarily establish at her first attempt was an abortive anticipation of the Ghassanid phylarchy on the Roman Empire's Syrian *limes*, and of Muhammad's oasis-principality of Medina whose capital was transferred by Mu'āwiyah to Damascus (see I. i. 74; II. ii. 11; VI. vii. 131 and 208-9).

⁵ At the Battle of the Camel (*commisum* 9 Dec., A.D. 656) it was not 'Ā'ishah, but her male confederates Talhah and Zubayr, who lost their lives.

⁶ See Bevan, E. R.: *The House of Seleucus* (London 1902, Arnold, 2 vols.), vol. i, pp. 181-3.

⁷ See Dill, S.: *Roman Society in Gaul in the Merovingian Age* (London 1926, Macmillan), p. 174.

their husbands to be removed from the arena by assassination before taking into their own hands the pursuit of a quarrel which for them was a personal blood-feud.

Fredegund of Neustria had a grievance against her paramour Chilperic that was comparable to the grievance of Laodice of Ephesus against her husband Antiochus—though not indeed a grievance of equal magnitude, since Laodice was not only Antiochus's wedded wife but was also his half-sister, whereas Fredegund was a maidservant who was her master's concubine. Chilperic dismissed his concubine Fredegund, besides repudiating his lawful wife Audovera, in order to contract a politically advantageous marriage with Galswintha, the daughter of Athanagild King of the Visigoths and the sister of Chilperic's brother Sigiberht's wife, Queen Brunhild of Austrasia.¹ Chilperic's and Antiochus's second marriages had the same motive and the same denouement in the literal sense of the word. In the sequel in either case the fickle king's first love prevailed over *raison d'état*, but Galswintha was more unfortunate than Berenice; for the Lagid queen survived her desertion by her Seleucid husband, to seize and hold half his inheritance before she met her violent end, whereas Galswintha's life was taken by Fredegund with Chilperic's connivance—a complicity that was flagrantly advertised when Chilperic rewarded his former concubine for the murder of his royal sister-in-law's royal sister by taking the bondwoman-murderess to wife. The blood-feud thus ignited between Brunhild and Fredegund was inflamed when Brunhild's husband Sigiberht was treacherously stabbed to death (with poisoned daggers) by agents of Fredegund in the hour of his victory, while he was being saluted by his brother Chilperic's Neustrian warriors as their king,² and it was exacerbated still further when, nine years later,³ Chilperic in his turn was assassinated by an unknown hand whose stab was never brought home to its instigator. Fredegund died in her bed;⁴ Brunhild was done to death sixteen years later⁵ by Fredegund's son Chlothar II under tortures⁶ which Olympias was spared in her judicial murder by Cassander.

These militant queens were not always content to leave even the physical fighting entirely to their male proxies. The fight in which 'Ā'ishah's warriors were worsted by 'Alī's acquired its name 'the Battle of the Camel' from 'Ā'ishah's personal presence on the field in her curtained camel-howdah 'wie ein Kriegsheiligtum';⁷ and Berenice the rival of Laodice literally took up arms at a crisis in her fortunes, when Laodice's partisans in Antioch had succeeded in kidnapping Berenice's infant son, whose claim to the Seleucid crown was the indispensable cloak under which his mother, like her rival, was fighting for her own hand.

'In this extremity Berenice showed the spirit of a lioness. The child was

¹ For the antithesis between Austrasia and Neustria, see II. ii. 167.

² See Dill, *op. cit.*, pp. 133 and 182. Sigiberht's end was a reproduction, 'in real life', of Siegfried's legendary death—for which a legendary King Gunther mourned as hypocritically as Queen Galswintha's authentic murder was mourned by an historical King Chilperic.

³ Sigiberht was assassinated in A.D. 575, Chilperic in A.D. 584.

believed to have been carried to a certain house. Berenice instantly mounted a chariot, took in her own hand a spear, and galloped to the spot. On the way, Caeneus [Laodice's leading partisan at Antioch] met her. The Queen aimed her spear at him. It missed. Nothing daunted, Berenice followed it with a stone, which brought her enemy down.¹

This historical episode lends colour to a legendary scene; for Brunhild likewise, in her assault-at-arms with Gunther, in which the female combatant's hand and the male combatant's life are the stakes, follows up with a stone's throw a spear-cast that has failed to kill.²

The evidence that we have now reviewed is perhaps sufficient to demonstrate that the Heroic Age is the age of opportunity for Goneril and Regan. Aristotle notices that 'most of the military and warlike breeds of men are under the regiment of women';³ but he does not discover for us the explanation of these facts that he has observed, for he records this observation incidentally to a discussion of the reason why gynaeocracy—'the regiment of women'—prevailed likewise at Sparta under the Lycurgean *agôgê* in its decadence, and his solution for this problem of Spartan psychology—a solution that is as convincing as it is acute⁴—is manifestly inapplicable to 'the regiment of women' over barbarian warriors in the Heroic Age.

To explain this peculiar phenomenon at Sparta, Aristotle puts his finger on the peculiar severity of the discipline to which the male half of the Spartiate community was subjected. As he points out, the authors and administrators of the *agôgê* had neglected—or had tried in vain—to impose on the Spartiate women a way of life that they had succeeded in imposing on the men with all too complete a success—with the result that the Spartiate women were at an advantage, in their dealings with the men, thanks to their own unrestricted enjoyment of a liberty, and even a licence, which were rigorously denied to their fathers, brothers, and husbands. Manifestly this explanation is as inapplicable to the barbarians as it is convincing apropos of the Spartans; for, in this matter of libertarianism, the barbarian warrior labours under no handicap whatsoever *vis-à-vis* his mother, sister, or wife. As we have already observed in the chapter to which this Annex attaches, the life of the barbarian warrior squatting in his moral slum⁵ inside a fallen *limes* is as

¹ Bevan, *op. cit.*, vol. i, p. 182. Berenice's presence of mind and physical prowess did not avail to enable her to recover possession of her child's body, alive or dead; but they did avail to win her such a preponderance of popular sympathy among the citizens of Antioch that the slain Caeneus' fellow municipal magistrates, who had been his accomplices in kidnapping Berenice's child on Laodice's behalf, found themselves constrained to exhibit a child to the people as the infant king.

² We are not, of course, suggesting that the assault-at-arms between Brunhild and Gunther, described in the *Nibelungenlied*, was an historical event. In the legendary Brunhild we have, not a poetic reminiscence of an historical personage, but a poetic transformation of a goddess into a human heroine. The legendary Brunhild, as her name bears witness, was originally a war-goddess clad in a coat of mail; and this origin, which is no longer discernible in the High German *Nibelungenlied*, is still manifest in the Norse *Volsungar Saga*.

³ Aristotle: *Politics*, Book II, chap. vi, § 6 (1269 B, 24-27). He notes, as exceptions to this 'law', 'the Celts and others who openly practise and approve homosexuality.' This subsidiary law of Aristotle's had been further illustrated, since Aristotle's own day, by the *mores* of the Egyptian Mamlûks.

⁴ See the present Study, III. iii. 75.

⁵ See the passage quoted from H. G. Wells in VIII D, on p. 53, n. 2.

lawless as the Spartiate 'peer's' life is regular (so long, at least, as the Spartiate 'peer' is held fast within the *cadres* of his mess in peace-time and his unit on active service). The explanation of the 'regiment' of women over the barbarian war-band must therefore lie in some non-Spartan direction. There are perhaps two lines of explanation, one sociological and the other psychological.

The sociological explanation is to be found in the fact that the Heroic Age is a social interregnum in which the traditional habits of Primitive Life in its latter-day Yin-state¹ have been broken up, while no new 'cake of custom' had yet been baked by a nascent civilization or nascent higher religion. In this unusual and ephemeral social situation a temporary social vacuum is filled by an individualism so absolute that it overrides even the intrinsic differences in nature between the sexes. This individualism does, of course, tell against women as well as in their favour. In the brutal anarchy of the Primitive Muslim Arab heroic age the normal inferiority of women to men in sheer physical strength did expose the women to the scourge of outright physical ill-treatment—at any rate among the Qurayshite lords of creation, whose standard of behaviour towards women had previously, in the pre-Islamic 'Days of Ignorance', already been conspicuously lower, not only than that of their sedentary neighbours at Medina, but even than the standard of their Nomad contemporaries.² Again, it can hardly be an accidental coincidence that the Macedonian, Merovingian, and Primitive Muslim Arab heroic ages should, all alike, be infamous for the facility with which the heroes divorced their wives—a wrong which was not righted by the corresponding facility with which the discarded women were able to obtain successive husbands. It is all the more remarkable to find this unbridled individualism bearing, in the political field, fruits hardly distinguishable from those of a doctrinaire feminism that is altogether beyond the emotional range and the intellectual horizon of the women and men of the Heroic Age,³ and to see these openings for the exercise of political power presenting themselves to Umayyad Qurayshī princesses,⁴ as well as to their Macedonian forerunners and their Merovingian sisters.

In the Heroic Age the state appears to have been regarded as little more than the property of an individual—or rather, perhaps, of a family, which itself was intimately connected with a number of other families in similar positions. . . . It is worth noticing what is recorded in *Beowulf* on an occasion of great emergency. Hygelac, King of the Geatas, lost his life in the disastrous expedition against the Frisians and left an only son, Heardred, who seems to have been scarcely more than a child. *Beowulf* escaped from the slaughter; and, on his return, "Hygd offered him the treasury and the government, the rings and the throne. She trusted not that her child would be able to hold his patrimony against foreign

³ 'Le féminisme, il faut bien en convenir, ne rencontrait pas à cette époque des partisans en Arabie, même dans les rangs du beau sexe' (Lammens, *op. cit.*, p. 316).

⁴ See Lammens, *op. cit.*, p. 329. Under the subsequent 'Abbasid régime, princesses lost the prestige and power that had been theirs under the Umayyad dispensation.

nations, now that Hygelac was dead."¹ There is no reference to any action on the part of the council or court; but the queen offers the throne to the late king's nephew. The whole passage seems to indicate that the throne, with all its rights, was regarded very much like any ordinary family property. Its disposition is arranged by the family itself, without any notion of responsibility to others; and the members of the court are not taken into account any more than the servants in a private household. It may perhaps be argued that court poets would be apt to exaggerate the power of the royal family, and consequently that the picture of its authority given here is misleading. Yet Amalaswintha, who was a contemporary of Hygelac, appears to have acted on her own authority when she associated Theodahath, the nephew of Theodric, in the sovereignty with herself after her son's death.²

In the legend of a post-Minoan heroic age that was current in an Hellenic World, the succession of the interloping Pelopidae to the preceding Perseid holders of the lordship of Mycenae was traditionally accounted for, as Thucydides points out,³ by the fact that the mother of the last Perseid king, Eurystheus, was the sister of the first Pelopid king, Atreus. On the strength of this relationship on the female side, Eurystheus, when he took his departure from Mycenae on a campaign against Athens from which he was never to return, was reputed to have left his castle and his kingdom in Atreus' charge; and the queen was the living hinge on whom politics turned in the lordship of Ithaca likewise, as the story is told in the *Odyssey*.

Though, even according to the unexacting standards of the Heroic Age, the Cephallenian *pallikaria* have got shockingly out of hand as a result of the twenty years' absence of their lawful king Odysseus, they have not the audacity to liquidate Odysseus' lordship by formally reducing their lost king's son and heir, Telemachus, to a station on an equality with their own, until the lost king's queen, Penelope, shall have consented to leave her missing husband's house in order to marry one of these lordlings' own number; and, though it is assumed that, if she does contract a second marriage, she will return for this purpose to the house of her father Icarius, to be given away for a second time from there, it is also assumed that, in the choice of her new husband from among her 108 suitors,⁴ the last word will lie, not with her father, but with her herself. 'Send your mother away and make her marry the man whom her father chooses and whom she prefers' is the course that is proposed to Telemachus by Antinous, parleying as spokesman for all the suitors.⁵ The implication seems to be that, so long as the missing king's living queen remains mistress of her absent husband's house, her loyalty to him—or even merely to his memory, if he should prove to be dead—effectively preserves the royal prerogative for Odysseus himself, should he live to return, or for his son Telemachus, should he live to grow to man's estate. So long as Penelope can contrive to continue to avoid mak-

ing the operative change in the *status quo adhuc*, all that her exasperated suitors can do is to continue, for their part, to exercise an indirect pressure on their queen and her son by wasting the substance of Odysseus' estate. They do not venture positively to coerce the queen into marrying again against her will, notwithstanding their resentful impatience with her interminable procrastination.

'The regiment of women' which these episodes reveal is a feature of the Heroic Age which fades away as the age itself passes.

'In the earliest records [of English history] which we possess, women of high rank seem to hold a very important and influential position. This feature is often ascribed to Southern and Christian influence; but, if so, it is not a little remarkable that it is much more prominent in the seventh century than in the eighth or ninth. Thus we find Eanflæd, the wife of Oswio, pursuing a very independent line of action within half a century of the conversion, while Cynwise, the wife of the heathen king Penda, would seem to have been acting as regent in her husband's absence, perhaps like Hygd the wife of Hygelac. Above all, Seaxburg, the wife of the convert Coenwalh, is said to have occupied the throne herself after his death. Bede's account of Saint Aethelthryth shows that queens had estates and retinues of their own; and this custom also must go back to heathen times, for the first reference that we have to Bamborough, the chief residence of the Northumbrian kings, is the statement that it was given by the heathen king Aethelfrith to his wife Bebbe.'¹

The evidence that we have considered so far suggests that 'the regiment of women' in the Heroic Age is the product of an individualism that is temporarily let loose by the breaking of a cake of primitive custom. But this explanation is still only a negative one. It indicates the favourableness of the opportunity that the Heroic Age offers to women, without explaining the women's success in turning this opportunity to account. A positive explanation is suggested by the reflection that, in the deadly game which the criminal barbarian successors of a decadent civilization have condemned themselves to play against one another, the trump card is not, after all, the sheer physical force in which the male barbarian has the advantage over his female opponent as a rule—notwithstanding the exceptional physical prowess of a legendary Brunhild and an historical Berenice. If the triumphant barbarians' fratricidal conflicts were really nothing but trials of physical strength, these jousts would be morally as innocent as the fights between rival bulls for supremacy in the herd; but even the triumphant barbarian is branded as being still recognizably human by the mark of an unexpunged Original Sin; and the fate of many a barbarian hero—or villain—of legend or history proclaims that, in a struggle for existence between sinful human beings, even when the competitors are barbarian-bred, mere physical strength by itself weighs light in the scales against demonic psychological forces. The winning cards in the barbarians' internecine struggle for existence among themselves are the energy, persistence, vindictiveness, and implacability that spring from a perversion of will-power, and the cunning and treachery that are hatched by a prostitution of intellectual ability. These are moral

¹ Chadwick, H. M.: *The Origin of the English Nation* (Cambridge 1907, University Press), pp. 314-15.

and mental qualities with which sinful Human Nature is as richly endowed in the female as in the male; and the masculine victims of a Kriemhild, a Fredegund, a Cleopatra, and a Rosamund might aptly echo the Pauline cry of distress:

'We wrestle not against flesh and blood, but against principalities, against powers, against the rulers of the darkness of This World, against spiritual wickedness in high places.'¹

The Cleopatra whose wickedness most aptly illustrates this text is not the notorious daughter of Ptolemy XI Auletes who was the last Macedonian queen to seize and lose a throne (though in her, too, a formidable vein of barbarian female ruthlessness lurked beneath a sophisticated 'make-up' of decadent Hellenic charm); the prime virago of the name² is the Cleopatra who was the daughter of Ptolemy VI Philometor and was by turns the wife of three male incumbents of the throne of the Seleucidae,³ Alexander Balas and the brothers Demetrius II Nicâtor and Antiochus VII Sidêtês; for this Cleopatra was the veritable 'Erinyes of the House of Seleucus'.⁴

Cleopatra ran amok when her incompetent second husband Demetrius, turning up again in Syria from a ten years' captivity (140/139-129 B.C.) in Parthia, lost no time in demonstrating, by making as deplorable a failure of his second reign as he had made of his first, that there was nothing new about him beyond the outlandish Parthian beard which advertised that, as a captive of the barbarians, he had not even been able to resist the temptation to 'go native'. When the restored Demetrius tried to make war on his brother-in-law Ptolemy VII Euergetes II and then suffered yet another resounding military defeat at the hands of a pretender to his own throne whom Ptolemy had unleashed against him as the simplest way of settling accounts, Cleopatra took the law into her own hands. She shut the gates of Ptolemais in her fugitive husband's face; and, when Demetrius was slaughtered on board ship in the harbour of Tyre, by orders of the governor, in an attempt to take sanctuary in the temple of Melkart, the suspicion that the governor was acting on Queen Cleopatra's instructions was warranted by her unquestioned responsibility for the subsequent assassination of her elder son Demetrius when he proclaimed himself his father's successor without submitting to his mother's tutelage. Cleopatra thereupon mounted the throne herself with her younger son Antiochus VIII 'Grypus' as her associate; and, when 'Grypus' began to show signs of restiveness in the role of his mother's puppet, Cleopatra attempted to make away with him in his turn, and, this time, lost her own life as the penalty for failing to take his. Her designs had been

¹ Eph. vi. 12.

² This originally Seleucid family name was introduced into the House of Lâgus by Cleopatra, daughter of Antiochus III, who was married to Ptolemy V Epiphanes and governed the Ptolemaic dominions as regent for her son Ptolemy VI Philometor from the time of her husband's death until she died herself, still occupying the seat of power.

³ This identification of her through her Seleucid marriages serves to distinguish her from her mother and namesake, who was the daughter, by the Seleucid Cleopatra, of Ptolemy V Epiphanes, and who married successively her brothers Ptolemy VI Philometor and Ptolemy VII Euergetes II, and also from a sister and namesake who, like their mother, was married to Ptolemy VII Euergetes II and who seized control of the Ptolemaic Government after Euergetes II's death.

⁴ Bevan, E. R.: *The House of Seleucus* (London 1902, Arnold, 2 vols.), vol. ii, p. 212.

betrayed to her intended victim by traitors in her own household; and, when she offered 'Grypus' a poisoned cup, he forced her to drink the lethal draught herself.¹

Gepid Rosamund died the same death as Macedonian Cleopatra; but Rosamund's paramour and fellow murderer Helmechis was less lucky than Cleopatra's son and fellow sovereign Antiochus. Helmechis had received no information in advance to prepare him for the emergency, and he swallowed half the potion which Rosamund had offered to him before he realized that it was poisoned—though he did realize this just in time to make 'Grypus's' effective retort of forcing the rest of the poison down the viper lady's throat; so Helmechis merely compelled his murderess-mistress to share with him a death which overtook him according to her plan, whereas Antiochus VIII 'Grypus' outlived his mother to spend the rest of his reign, no longer incommoded by her leading-strings, in fighting an inconclusive civil war with his half-brother and first-cousin Antiochus IX Cyzicenus, the son whom Cleopatra had born to her third husband, 'Grypus's' uncle, Antiochus VII Sidëtês.

Rosamund's career, which thus had the same ending as Cleopatra's, is an epitome of the Heroic Age which illustrates almost every aspect of barbarian criminality.

In the first act, as we have noticed,² Rosamund undergoes Helen's legendary experience of being the passive, and perhaps innocent, cause of the extermination of a people and the slaying of its king—with the miserable difference that, in Rosamund's historical tragedy, the exterminated people are her own countrymen, the slain king is her own father, and her personal fate is the excruciating one of being taken to wife by her father's slayer, as the prize of a successful act of bloodthirsty aggression to which the Lombard king Alboin has been prompted by his unsatisfied desire to possess the Gepid King Cunimund's daughter.

The second act shows Rosamund, some seven years later, in residence with her husband in his palace at Verona: the capital of a successor-state of the Roman Empire in Italy which Alboin has been carving out for himself since his destruction of Rosamund's race on a Central European battlefield. In an inauspicious hour, Alboin, being already the worse for drink, sends for the drinking-cup which has been made for him out of Cunimund's skull, and tells his cup-bearer to offer it to the queen with an invitation 'to drink merrily with her father'. Rosamund duly drinks from the skull without visible demur, and inwardly determines on a revenge which, in the third act, she duly executes.

In this third act Rosamund incites King Alboin's foster-brother and armour-bearer Helmechis to conspire with her for the compassing of Alboin's death. She lures her chosen instrument with the offer of her own hand and the prospect of entering into her husband's and his master's heritage—for it is assumed that the Lombard crown will pass with its murdered owner's Gepid queen, even if the queen is, by proxy,

¹ This last chapter in Cleopatra's life is recounted by E. R. Bevan in *The House of Seleucus* (London 1902, Arnold, 2 vols.), vol. ii, pp. 250-2.

² On p. 651, above.

the king's murderess. Helmechis succumbs to his temptress, but makes the enlistment of Alboin's chamberlain Peredeo a condition of his own participation; and, when Rosamund proceeds to approach Peredeo, the chamberlain rejects the queen's overture. Peredeo's negative loyalty to Alboin puts Rosamund in a quandary. Her murderous machinations have been brought to a halt, and her own life is now at the mercy of an unresponsive confidant; but in this crisis she succeeds in turning the tables on the chamberlain by a move in which she exhibits a shamelessness which is as remarkable as her presence of mind. Peredeo's loyalty to Alboin has not gone to the positive length of leading him to warn the King of the conspiracy which the chamberlain has refused to join; and, without giving Peredeo time to have any saving second thoughts, Rosamund effectively compromises her potential *delator* by taking the place of one of her ladies-in-waiting with whom the King's chamberlain has a *liaison*, and confronting Peredeo with the *fait accompli* of having unwittingly seduced the King's wife. It is now no longer Rosamund, but Peredeo, who is in danger of being denounced to Alboin; his peril ensures his treason, and in the last scene of this third act of the drama—a scene in which King Alboin, like King Malcolm, is murdered in his bed—it is apparently Peredeo, not Helmechis, who plays Macbeth's part. Perhaps Helmechis has found himself unable to summon up the hardihood—which assuredly would not have failed Rosamund had she been either of her masculine accomplices—to break a twofold tabu by personally taking the life of a foster-kinsman who is at the same time his lord.¹

The fourth act shows us Rosamund's deed of vengeance duly accomplished, but Helmechis disappointed of the political prize that was to have been half his reward for lending himself to the execution of his royal temptress's criminal plot. The crime has proved too shocking to be condoned even by barbarian consciences; and, instead of mounting together the murdered Alboin's throne, Rosamund and Helmechis have had to flee together for their lives. They have been given asylum by the Constantinopolitan viceroy of Italy, who has found it easier to ship Alboin's murderers, with Alboin's treasure in their baggage, from Verona to the viceroy's water-girt fastness-capital at Ravenna than to withstand a living Alboin's prowess in wresting from the Roman Empire a recently recovered dominion which it is the viceroy's duty to defend. In the astonishing transformation scene now staged in Fortune's kaleidoscope the initiative is thrown into the viceroy's hands, and he proves himself as brilliant in intrigue as he has been contemptible in war. The achievement of her revenge has left Rosamund still unsatisfied; for her vindictiveness has been alloyed with ambition, and her dream of ruling at Verona with Helmechis as her consort-puppet, which was in her mind when she offered the wretch her hand in exchange for her first husband's death, has been shattered by the Lombards' disconcerting

¹ When Alexander did slay his foster-kinsman Cleitus, there was at least only one tabu violated, since in this case the foster-victim was the King's retainer, while the King himself played the foster-murderer's part; and, besides that, the Macedonian counterpart of the Lombard crime was committed, not premeditatedly in cold blood, but at a moment when both men were drunk and when neither of them was *compos mentis*.

squeamishness. To find herself married to Helmechis as her fellow refugee at Ravenna is a predicament for which she has not bargained; and the viceroy is as quick to espy and attack the barbarian virago's *côté faible* as Rosamund herself has been to get Helmechis and Peredeo into her toils. 'Why not,' whispers the viceroy to the virago—'Why not repeat your exploit of murdering a husband and thereby put yourself in a position to marry me? Though unfortunately I cannot reinstate you in your late husband's kingdom, which I have failed to prevent his carving out and which you have failed to seize for yourself, I can at any rate make you vicereine of what Alboin has left to me of Roman Italy.' The temptress, thus tempted in her turn, readily swallows her tempter's bait and thereby meets her death, as has been narrated, in the process of carrying out the viceroy's sly suggestion.

On learning that Rosamund, as well as Helmechis, was dead, the viceroy must have breathed a sigh of relief, for manifestly a lady who had successfully made away with two husbands would not have scrupled to mete the same measure to a third, had she lived to take this into her head. Lucky Longinus! He had escaped the lady and inherited her treasure. A Lombard hoard in which the spoils of the Gepidae had been augmented by the plunder of the richer half of Italy was something worth having. The unfortunate Gepids' involuntary contribution could fairly be booked by the Imperial Auditor-General as interest due on capital that had been levied by Alboin in Italy without its lawful Roman owners' leave. Like the good civil servant that he may well have been, the viceroy Longinus duly remitted Rosamund's treasure from Ravenna to Constantinople, where it was as utterly out of reach of itching barbarian hands as was the treasure of the Nibelungs after Hagen had sunk it in the Rhine.¹

The ironical or censorious spectator who views the tragedy of Rosamund from the ivory tower of some place and time far removed from the moral slum of the Heroic Age—though not on that account immune from other exhibitions of Original Sin—will be better advised to apply to the daughter of Cunimund the more charitable verdict that has been pronounced by a Christian historian on Philometor's daughter Cleopatra.

'From her girlhood she had been treated as a thing whose heart did not come into consideration, a mere piece in the political game. What wonder that she became a politician whose heart was dead?'²

If we ask ourselves whether these women who exercise their 'monstrous regiment' in the inferno of the Heroic Age are heroines or villainesses or victims or elusive participants in all three roles, we shall arrive at no clear-cut answer to our question. Unquestionably, on the other hand, this tragic moral ambivalence makes them ideal subjects for poetry; and it is no accident that, in the epic legacy of a post-Minoan heroic age, one of the favourite *genres* should have been 'catalogues of

¹ The story of Rosamund is recounted by Thomas Hodgkin in *Italy and her Invaders*, vol. v, Book VI (Oxford 1895, Clarendon Press), pp. 134-40 and 168-73. On p. 168, Hodgkin notes that, in the sagas of the Lombards, 'women had already played a leading part'.

² Bevan, *op. cit.*, vol. ii, p. 250.

women' in which the recital of one legendary virago's crimes and sufferings called up the legend of another representative of her kind, in an almost endless chain of poetic reminiscences.¹ The historic women whose grim lives echo through this poetry would have smiled, with wry countenances, could they have foreknown that a reminiscence of a reminiscence would one day evoke *A Dream of Fair Women* in the imagination of a Victorian poet. They would have felt decidedly more at home in the atmosphere of the third scene in the first act of *Macbeth*.

¹ The epic formula ἢ οἷη ('or such as was'), by which each link in this tragic chain was attached to its predecessor, generated the nicknamed *HOIAI* for catalogues of this type. The fragments of two collections of the kind—the *HOIAI*, *alias KATAΛΟΓΟΣ*, and the *METAAI HOIAI*—will be found in Aloisius Rzach's edition of the works of Hesiod, to whom the authorship of this poetry came to be ascribed (*Hesiodi Carmina recensuit Aloisius Rzach, editio altera* (Leipzig 1908, Teubner), pp. 131-87). A longer specimen is embedded in *Odyssey*, Book XI, ll. 225-332.

VIII E (I), ANNEX

OPTICAL ILLUSIONS IN HESIOD'S VISTA OF HISTORY

IN A Dark Age that is pregnant with a new civilization a speculative mind is both stirred by the quickening of its social environment and cramped by the cribbedness of its historical horizon.

This lowness in the degree of historical visibility, with which an intellectual worker in a Dark Age is condemned to contend, handicapped the superlative genius of Ibn Khaldūn in his study of the rises and falls of empires; for all the empires of which the great Maghribī historian-philosopher had any substantial knowledge belonged to the particular—and peculiar—class of empires founded by Nomads.¹ Even the Baghdādī 'Abbasid and Cordovan Umayyad caliphates were derivatives of a Damascene Arab Nomad successor-state of the Roman Empire; and, in Ibn Khaldūn's vista, this antecedent non-Nomadic universal state was barely visible. The authentic sources of Roman history were not accessible to the Maghribī scholar; and the inductions on which he bases his historical 'laws' are thus perforce drawn almost exclusively from the histories of a Caliphate originating in the Primitive Muslim Arab *Völkerwanderung* and of this Caliphate's Berber, Arab, Turkish, and Mongol Nomad successor-states. A similar limitation of historical outlook betrayed the author of the Hesiodic catalogue of races into falling a victim to a series of optical illusions.

We have already noticed² that Hesiod is fantastically out of his reckoning in his attempt to take his own generation's historical bearings. From his Epimethean standpoint he has mistaken the expectant darkness before dawn for an eternal night of unrelieved gloom.³ We have also noticed⁴ that his vision has played him false even when it has been directed towards the past age lying nearest to his own. His astigmatism has diffracted the social interregnum immediately following the dissolution of the Minoan Civilization into a mirage of two separate ages—an Age of Bronze and a subsequent Age of Heroes—which, in reality, are merely diverse aspects of a single episode of history. But Hesiod's mental vision has not only played him this trick of diffracting one age into the semblance of two; it has also led him into the contrary error of 'telescoping' two, or perhaps even three, ages into the semblance of one.

The Race of Gold, as Hesiod depicts it,⁵ may be interpreted as standing, in the first instance, for 'the thalassocracy of Minos'—the imposing universal state which is the earliest form in which the Minoan Civilization will have made an enduring mark on the imagination of its Achæan

¹ This point has been noticed in III. iii. 24.

² On pp. 57 and 79-80, above.

³ This illusion of an Hellenic poet in the eighth century B.C. has its counterpart in Western history in the expectation—widely current in Western Christendom at and after the opening of the eleventh century of the Christian Era—that the end of the World was at hand (see I. i. 171, n. 1).

⁵ In *Works and Days*, ll. 109-26.

barbarian successors whose epic poetry is Hesiod's *Book of Genesis*. On this interpretation the Race of Silver, who are the Golden Men's epigoni, will stand for these same Minoan 'thalassocrats' in the subsequent *dégringolade* which results in their being swept away to leave the field to a barbarian Race of Bronze. The Silver Men's contemptible combination of babyishness with aggressiveness and godlessness accords with this reading of the passage, while, on the same interpretation, the, at first sight, surprising meed of honour that is paid to them retrospectively, after their unceremonious liquidation, is explicable, not as a tribute to virtues with which the Race of Silver is not credited, but as a protest against atrocities, perpetrated by an interloping Race of Bronze, which make the liquidated Silver Men's viciousness look amiable by comparison.

While this is undoubtedly one component of Hesiod's picture of the Race of Gold, it can hardly be the only one; for a vista of a civilization that sees no farther back than the heyday of its universal state is, of course, a drastically foreshortened view; and we may guess that, on a different plane of vision, Hesiod's races of Gold and Silver cover, between them, the whole history of the Minoan Civilization from start to finish—the Race of Gold standing for a Minoan age of growth, and the Race of Silver for a Minoan age of disintegration.

On this interpretation, Hesiod's Race of Gold and Race of Iron, which, in the poet's vista, seem to stand out at the two poles of his graduated series of morally deteriorating phases of society, prove really to be two instances of an identical phase, which feels like an age of iron to a poet born into the growth-phase of the Hellenic Civilization, but looks golden to him when he is viewing the growth-phase of the alien and mysterious Minoan Civilization through the kindly mist of a tradition that has been mellowed by the passage of the centuries.

Yet the posthumous glitter of the growth-phase and of the Indian Summer of the Minoan Civilization does not account for all the elements in the life of the Race of Gold, as Hesiod describes it. A feature to which the poet gives prominence¹ is the Golden Men's effortless enjoyment of an abundant food-supply which the soil produces for them of its own accord without exacting from them any agricultural labour; and, though this may be no more than a naïve barbarian observer's impression of the mysteriously organized life of an urban population whose industry commands supplies of food which it has not produced for itself, it may also be a genuine recollection of a food-gathering phase of human economy—antecedent to the birth of the Minoan or any other civilization—in which Primitive Man, after his arduous feat of becoming fully human, had rested for a season from his labours in a static Yin-state.² This is the interpretation of the Hesiodic *ἐνὶ Κρόνου βίος* that was current among latter-day Hellenic men of letters—though the likewise Hesiodic myth of Cronos's overthrow by his usurper-son Zeus³ looks more like a reminiscence of the replacement of a fallen Minoan

¹ In *Works and Days*, ll. 116–19.

³ See *Theogony*, ll. 71–73.

'thalassocracy' by one of its Achaean barbarian successor-states.¹ In an age in which this food-gathering economy had been observed in the life by Modern Western anthropologists who had tracked down the last of the food-gatherers in the fastnesses where they had sought shelter from the disturbing impact of the parvenu civilizations, these latter-day observers had been able to ascertain that this régime of casual labour was indeed a life of relatively low psychological tension by comparison with the organized and disciplined life of the husbandman, the shepherd, and the industrial worker; but, just because of this, it had proved not to be a life of material plenty or comfort.

On this analysis, Hesiod's Golden Age dissolves into three ages, one of which turns out to be identical with an Iron Age that is not, after all, the dead end that Hesiod felt it to be, but is the dayspring that, in retrospect, looks like gold. On the other hand, Hesiod's Bronze Age and Heroic Age lose their separate identities and melt into a single age for which Hesiod's sombre picture of the Iron Age would serve as an apt description.

IX. B (I), ANNEX

THE RELATIVITY OF THE UNIT OF CLASSIFICATION TO THE OBJECT OF STUDY

THE ground on which some twenty-one or twenty-three units have been treated in this book as so many distinct representatives of a species of society that we have labelled 'civilizations' is our finding that each of them constitutes, in itself, an intelligible field of study.¹ Whereas the parochial communities into which most of these civilizations were articulated at some stages of their histories prove to have shared their main historical experiences with most of the other parochial communities comprised within the same society, so that the history of any single parochial community is intelligible only in the setting of the history of the whole society in whose life it has been a participant, the history of each of these larger social units, the civilizations, proves, by contrast, to be more or less intelligible in itself, because each civilization, in so far as it has met with the typical specific experiences of the species of which it is one representative, will be found to have met with them in circumstances, in places, and at dates that were peculiar to its own history, so that these episodes can be studied and comprehended in isolation from the corresponding experiences in the histories of other civilizations.

It is true that, where we have a pair of civilizations—for instance the Muslim pair or the Christian pair—in which the two sister civilizations are both affiliated to one and the same antecedent society, each of the two may prove to have emerged at approximately the same date from the intervening social interregnum; but, thereafter, even when the two sister civilizations are conjuring up 'renaissances' of elements in the life of their dead common parent, we shall find² that they are each apt to revive different elements of this common heritage in response to different challenges, and we have already found that their histories are apt to follow equally independent and distinctive courses in other respects.

For example, the main body of the Orthodox Christian Society broke down, on our interpretation of its history, at a date signalized by the outbreak of the Great Romano-Bulgarian War of A.D. 977-1019, i.e. at a date before the Russian offshoot of the Orthodox Christian Society had yet been planted out. This means that the breakdown of this Russian Orthodox Christendom, whatever date we may assign to it, must, *ex hypothesi*, have been later than the date of the breakdown of the main body of Orthodox Christendom, and must therefore have occurred in different circumstances, as well as in a different geographical theatre; and, when we go on to ask ourselves about the breakdown of the sister Western Christian Civilization, we shall find ourselves unable, on the historical evidence forthcoming midway through the twentieth century of the Christian Era, to certify that, by that date, the experience of breakdown had yet overtaken a long since broken-down Orthodox Christendom's Western sister. It was certain, at any rate, in the year

¹ See I. i. 17-50, cited on p. 88, above.

² In X. ix. 1-166.

A.D. 1952 that the Western Society had not yet entered into a universal state, whereas by that date each of the two Orthodox Christian societies had not only entered into a universal state of its own but had already passed out of this again—if we are right in seeing the universal state of the main body of Orthodox Christendom in the Ottoman Empire and the universal state of the Russian offshoot of Orthodox Christendom in the Muscovite Empire.

If these historical findings are correct, they warrant our practice of treating our twenty-one or twenty-three units as so many distinct representatives of one and the same species of society for the purpose of studying some, at least, of this species' specific experiences. We have found, for instance, that this practice has justified itself, by proving to answer to the historical facts, in our study of the geneses, growths, and breakdowns of civilizations and in our study of encounters between contemporaries, and we shall find it justifying itself again, on the same empirical test, when we come to study the renaissances of elements of the cultures of antecedent civilizations. Moreover, in our study of institutions generated in the course of the disintegrations of civilizations, we have found that each of our units can be treated as an intelligible field in itself for a study of the universal states established by dominant minorities¹ and a study of the war-bands mustered by the transfrontier barbarians.² On the other hand we have found that, in studying the recruitment of internal proletariats and the epiphanies of higher religions within their bosom in the histories of the disintegrations of civilizations of the second generation, the confines of a single civilization no longer afford us an intelligible field of study for the purpose here in view. For this purpose, we have had to expand our historical horizon by taking cognizance of contacts or encounters between two or more civilizations that have been one another's contemporaries.

In finding this we are, of course, simply finding—as we should indeed have expected *a priori*—that the range of the intelligible field of historical study is not the same for all purposes but varies in accordance with the nature of the object that is being studied in each case. Each different historical object will be found to have a specific field of its own, with a specific range that is the optimum for the study of this particular object; and all that we are claiming for the twenty-one or twenty-three units with which we have operated in Parts I–VI and in Part VIII of this Study, as well as in the present Part IX, and with which we shall operate again in Part X, is that these prove to be intelligible fields for the study of the geneses, growths, and breakdowns of civilizations, for the study of universal states and barbarian war-bands, for the study of encounters between contemporaries, and for the study of renaissances. We do claim that, for these purposes, it is both correct and illuminating to treat these units as so many distinct members of one and the same species of society; but, in claiming this, we are not claiming that our units are necessarily all on a par with one another in other respects.

Supposing, for example, that we were studying, not the experiences of civilizations, but their heritages from the Past, then manifestly, for

¹ See VI. vii. 1–379.

² See pp. 1–87, above.

the purpose of that study, the relation between the three 'Hellenistic' Christian civilizations or between the two 'Syriatic' Muslim civilizations or between the two 'Sinistic' Far Eastern civilizations would not be found to be on a par with the relation between, let us say, a 'Syriatic' Iranic Muslim civilization and an 'Indistic' Hindu civilization that had collided with one another, without coalescing, in India. For the particular purpose of studying heritages, we should begin by sorting out the mutual relations between our twenty-one or twenty-three units into two distinct classes: one class of relations in virtue of which the members of a pair or a trio of societies might be called one another's 'sisters', in virtue of their being affiliated, alike, to one and the same antecedent civilization, and another class of relations in which the parties were not linked with one another by any common heritage derived from one identical predecessor. In studying the heritages of the civilizations of the third generation, we should have to take account, not only of the antecedent civilizations to which they were affiliated, but also of the churches that had served them as their chrysalises; and, for this purpose, we might find ourselves reducing the number of our units in this generation from eight to two, namely one great society—comprising the three Christian and the two Muslim civilizations—which had derived its religious inspiration and acquired its moral *éthos* mainly from Judaism, and a second great society, comprising the Hindu Civilization and the two Far Eastern civilizations, whose religious inspiration and moral *éthos* could be traced back in some part to Buddhism. The spiritual affinity between the Judaistic Muslim hero the Mahdi Muhammad Ahmad and his adversary the Judaistic Christian hero General Charles George Gordon would leap to the eye of a Buddhist monk or a Confucian philosopher, while conversely a Muslim or a Christian observer would perceive the spiritual affinity between an Indistic Hindu sanyasi and an Indistic Japanese practitioner of the Zen discipline of Mahayanian Buddhism.

These considerations seemed to the writer of this Study to suggest the answer to a pertinent and trenchant criticism, by Prince Dmitri Obolensky, of the writer's classification of the main body of Orthodox Christendom, the offshoot of Orthodox Christendom in Russia, and the Western Society as three separate civilizations.

'The picture we shall have of Byzantium and the Mediaeval West,' Prince Obolensky writes in his critique of this classification, 'will be of two different but closely interwoven halves of one Graeco-Roman Christian and European civilisation.' Neither half, on this reading, was in any real sense a self-contained unit or a fully "intelligible field of historical study", at least until the fifteenth century. . . . From the eighteenth cen-

¹ The same view of the relation between these two Christendoms was expressed by B. H. Sumner, the late Warden of All Souls College, Oxford, in a letter of the 25th January, 1951, to the writer of this Study:

'Where I differ, with great hesitation, from you is in regarding Western Christendom and Eastern Christendom as [being] sufficiently close to each other to be grouped together. I look upon them as, on the whole, one Christendom, or one "West", with two facets.'

B. H. Sumner's view is expounded in a paper on 'Russia and Europe' in *Oxford Slavonic Papers*, vol. ii (Oxford 1951, Clarendon Press), pp. 1-16.—A.J.T.

ture. . . . Russia's Byzantine heritage, overlaid with influences from the contemporary West, ceased to be the primary source of Russian culture, and the "intelligible field" of Russian history in this period should be widened to include the greater part of Europe. In any case the realm of Byzantine Civilisation, which in geographico-cultural terms can, both in mediaeval and [in] modern times, be largely described as Eastern Europe, was never a self-contained unit, but should be regarded as an integral part of European Christendom.¹

In so far as Prince Obolensky's criterion, in this paper, for his classification of civilizations is the presence or absence, in their heritages, of common legacies from antecedent civilizations, the writer of this Study would not only agree that, for this purpose, three of the units which, in this Study, have been distinguished from one another for a different purpose could and should be treated as so many parts of a single more comprehensive unit; he would go on to submit that, for the purpose of classifying societies by their heritages, if the criterion of unity or separateness is to be their participation or their non-participation in a dual heritage from both Hellenism on the one hand and Christianity on the other, then the ambit of Prince Obolensky's 'one Graeco-Roman Christian and European Civilization' must be extended, as has been suggested above, to include the present writer's two Muslim civilizations as well—considering that Islam originated as a Christian heresy² and that thereafter, in the 'Abbasid Age, Islam followed Christianity's example in receiving into itself the heritage of Hellenism in the two intellectual provinces of Philosophy and Science³ and worked out for itself a Hellenistic Islamic theology on the pattern of the Hellenistic Christian theology previously worked out by the Greek Fathers of the Christian Church. The Muslims cannot be ruled out of membership in a society for which the certificate of membership is a participation in both the Christian and the Hellenic heritage; and, though their inclusion requires the abandonment of Prince Obolensky's geographical limitation of his Graeco-Roman Christian Civilization to the confines of Europe, this limitation cannot in any case be maintained unless Orthodox Christendom, as well as Dār-al-Islām, is excluded, considering that the cradle of the Orthodox Christian Civilization lay on the Asiatic side of the Black Sea Straits, in Asia Minor.⁴ Indeed, even Western Christendom could hardly be claimed as a product of Europe, considering the importance, in its life and thought, of the influence of Latin Fathers whose home was North-West Africa.

On the other hand, for the purposes of studying the geneses, growths, and breakdowns of civilizations and the histories of universal states, barbarian war-bands, encounters between contemporaries and renaissances, a unitary Helleno-Christian 'great society' is not, in the present writer's view, an effective or an illuminating unit for the conduct of intellectual operations. These seven lines of study can be pursued, in his view, with better chances of success if, for these purposes, an Helleno-

¹ Obolensky, D.: 'Russia's Byzantine Heritage', in *Oxford Slavonic Papers*, vol. i (Oxford 1950, Clarendon Press), pp. 53 and 56.

² See V. v. 230, n. 4, and p. 347, above.

³ See p. 408, with n. 5, above.

⁴ See I. i. 63-64; II. ii. 79; and p. 726-7, below.

Christian monolith is dissected into five separate civilizations. These smaller units seemed to the writer to be indicated for these purposes because an empirical inquiry showed—so it appeared to him—that, in so far as these experiences had been met with in the histories of these five units up to date, each unit had had its own separate experience of genesis, growth, and breakdown, had generated its own separate universal states and war-bands, had had its own separate encounters with contemporaries, and had evoked its own separate renaissances, whereas he could not recall a single case in which any of these experiences had been shared by all the five units in question. So far from that, it appeared to him that the experience of passing through a universal state, which had already overtaken the two Orthodox Christian civilizations, had not yet overtaken the Western Civilization or either of the two Muslim civilizations. If this diagnosis was correct, it seemed to follow that the study of universal states could not be illuminated, but could only be obscured, by operating with the Helleno-Christian civilizations as the single unit that would be the key to a successful intellectual operation when the objects of study were, not experiences, but heritages.

It seemed to the writer that the five smaller units were decidedly more efficient keys than the single monolithic unit when the object of study was the historical phenomenon of encounters in the Space-dimension between civilizations that were contemporary with one another. The frequency and intimacy of the encounters between the three non-Muslim Helleno-Christian societies had been taken by Prince Obolensky as a sign that in truth these were, not three societies, but one society. In the second of the two passages quoted above he adduces the penetration of Russia by cultural influences radiating from the Modern West as evidence that, in this chapter of history at least, Russia and the West ought to be regarded as being provinces of one single cultural realm, and in the sequel to the first passage of the two he similarly adduces the penetration of a Medieval Western Christendom by cultural influences radiating from Byzantium as evidence that Byzantium and the Medieval West ought to be regarded as being 'two different but closely interwoven halves of one Graeco-Roman Christian and European civilization.'

'If,' he continues, 'we were inclined to doubt the truth of this interpretation, we have only to think how much will remain unintelligible in the mediaeval history of Western and Central Europe unless we consider the Byzantine contributions to its culture: Anglo-Saxon scholarship of the eighth century, the Carolingian art of the ninth, Otto III's restoration of the Roman Empire, the growth of the Norman Kingdom of Sicily, the cultural aftermath of the Crusades, the Italian Renaissance, these and other important events of European history cannot be understood without reference to Eastern Europe. The Basilica of St. Mark in Venice, the Art of Giotto and El Greco, are these not eloquent signs of how much the Western World owed to the genius of Byzantium?'

Indisputably they are; but are they not also signs that the body social which was the recipient of this cultural radiation was a separate and a different entity from the body by which the radiation was emitted?

¹ Obolensky, *op. cit.*, p. 53.

For, when we turn our attention from the impact of Byzantium on the Medieval West to the impact of the Modern West on its contemporaries, we find parallels to all the phenomena cited by Prince Obolensky from the history of the encounter between Byzantium and the Medieval West in the relations between the Modern West and three Buddhist societies—the Hindu, the Far Eastern in China, and the Far Eastern in Korea and Japan—which neither Prince Obolensky nor any other student of history would be likely to classify, in virtue of these relations, as being so many subdivisions of a single all-embracing civilization in which the Western Civilization was likewise to be reckoned as being included.

The inspiration of eighth-century Anglo-Saxon scholarship and ninth-century Carolingian art by the genius of Byzantium has its counterpart in the inspiration of nineteenth-century Bengali scholarship and twentieth-century Bengali art by the genius of the Modern West. Otto III's restoration of the Roman Empire in Byzantine dress has its counterpart in the restoration of the Mughal Rāj in Western dress by the British East India Company. The establishment of a Norman successor-state of the East Roman Empire in Sicily is matched by the establishment, in A.D. 1947, of three Asian successor-states of the British Rāj in India: Pakistan, the Indian Union, and Burma. The cultural aftermath of the Crusades in Western Christendom has its counterpart in the cultural aftermath, in the Ottoman Muslim World, of the 'Osmanlis' likewise temporarily victorious *jihāds* against the Christendoms (if we may allow ourselves to cite this one example from the history of the relations between the Modern West and an Islamic Civilization that shared with the West its Hellenic-Christian heritage). The Byzantine contribution to the Italian renaissance of an Hellenic literary culture consisted in initiating the fifteenth-century Italian humanists into the Greek originals of Roman copyists' Latin imitations through which the Italian Humanists had previously been cultivating Hellenism at second hand;¹ and, in the history of the impact of the Modern West upon the Hindu World, this Byzantine service to the Italian Humanists has its counterpart in the initiation of nineteenth-century and twentieth-century Hindu pandits into a scientific study of Sanskrit by the Western pioneers in the science of the comparative study of the Indo-European languages. The imprint of Byzantium on the Basilica of St. Mark in Venice has its counterpart in the imprint of the Italian Renaissance on the Taj Mahall at Agra. The Byzantine *motifs* in the art of Giotto and El Greco have their counterparts in the Western *motifs* in the art of a twentieth-century Japan.

On this showing, the evidences of the penetration of Western Christendom by the radiation of Byzantine cultural influences would seem, in the present writer's eyes, to indicate, not that Byzantium and the Medieval West were provinces of one and the same cultural realm, but rather that they were two distinct societies whose relations were on a par with those between a Modern Western Society and its contemporaries in India and the Far East.

¹ See IV. iv. 275, n. 1, and 363, n. 1; and X. ix. 63.

As the present writer saw it, however, the lesson to be learnt from Prince Obolensky's critique of the writer's classification of civilizations was not that either the writer's own classification or Prince Obolensky's alternative classification was right or wrong in any absolute or universal sense. The lesson appeared to be that all such classifications, analyses, and dissections were keys which were useful in so far as they served the practical purpose of opening locks. Any one of them would have been proved to be a genuine key if it did effectively unlock a door; and some of these keys were good for opening more doors than one; but there did not seem to be any master key that rendered all its fellow keys superfluous by unlocking all doors alike; and therefore a resourceful researcher who had been moved by his curiosity to explore the wonderland of History would keep on adding to the bunch of keys on his key-ring. Whenever he ran into a closed door barring the way to further progress in his intellectual quest, his first recourse would be to try whether any of the keys already on his ring would turn this next door's lock; but, if none of them proved to fit, he would neither try to force the door nor despair of succeeding in opening it, but would set about casting a new key to fit a lock that had been proved by experiment to be one of a novel structure.

IX. B (ii) (a) 1, ANNEX I

THE ROLE OF TECHNOLOGICAL COMPETITION IN THE WESTERNIZATION OF RUSSIA

THE part played in the Westernization of Russia by a spontaneous response to the appeal of the Modern Western culture, as contrasted with a reluctant capitulation to a recognized necessity of adopting Western weapons for the purpose of keeping the West at bay, is underlined in the following note by Prince D. Obolensky:

'I would say that to describe the relations between Russia and the Modern West solely, or mainly, in terms of a technological race between a rapidly expanding Western military and economic technique and a Russian resistance to the resultant menace of military conquest or cultural absorption would be to paint only part of the picture. It is, of course, true that Peter's reforms were primarily dictated by military considerations and by Russia's need, in order to maintain and improve her military and political status as a great European power, to "catch up" with the economically more advanced West. Moreover, I would agree, up to a point, that the Westernizing movement among the educated minority of the Orthodox population of Western Russia in the sixteenth and seventeenth centuries found its *raison d'être* in the policy of resisting encroachments of the West (i.e. of the Roman Catholic Church) by adopting Western weapons (i.e. from Catholicism and Protestantism). But . . . I would say that this Westernising movement, not only in the Ukraine but in Muscovy as well, was due just as much to a genuine belief held by some of its leaders in the superiority of the contemporary Western culture, and to their desire to imitate Western habits and institutions because they were good in themselves. This is surely true of such outstanding statesmen and diplomatists of the second half of the seventeenth century as Ordin-Nashchokin and Prince V. Galitsin, who pursued a policy of "selective Westernisation".'

On the other hand it is surely also true that Peter the Great himself, spiritual 'changeling' though he was in his native Muscovite cultural environment, was an *anima naturaliter Occidentalis* only in the narrowly limited sense of having a gift and a passion for the contemporary Western World's technology. We have noticed in another context¹ that this technological approach of his was distasteful to cultivated Westerners of that age—for example, Bishop Burnet and King William III—who had not been broken in to a future Industrial Age of Western Civilization in which this exotic young barbarian man of genius was already living by anticipation; and, though Peter's genius was so great that he soon became aware of the necessity of broadening his approach if he was to succeed in attaining his primary technological objective, his spontaneous appetite for the non-technological elements in the Western Civilization always remained comparatively feeble except in so far as it was whetted by a partially enlightened view of the requirements of a technological utilitarianism.

¹ In III. iii. 279.

Within the province of Technology, Peter did give proof, as soon as military necessity allowed, of a spontaneous impulse to extend the range of his Westernizing policy from the manufacture of Western weapons to the manufacture of Western non-military commodities.

'Between A.D. 1695 and A.D. 1709 nearly three-quarters of the new manufactories were state works, and nearly all of them were designed for military and naval needs. Between 1710 and 1725 the picture changes, as the needs of war become rather less absorbing. The new works in his later years were far less concentrated on military needs; silk, velvet, and ribbon manufactories were started; china, glass, and brickworks made their appearance. A number of the state factories were handed over to private operation, and Peter pressed forward the opening of new works by individuals or companies, granting them important exemptions and privileges'.¹

In thus becoming less exclusively military, Peter's Westernizing activities did not, however, become less utilitarian—as is shown by the persistent utilitarianism of his educational policy;² and, though, here too, the scope of the Westernizing movement in Russia broadened rapidly after Peter's death, this subsequent progress of Russia's cultural Westernization beyond the limits of military or even civil utilitarian requirements seems to have been due, not so much to a Russian 'desire to imitate Western habits and institutions because they were good in themselves', as to the operation of a cultural 'law'³ that, in any encounter between contemporaries, a single element of a radioactive alien culture, when once admitted into a recipient society's body social, tends to draw in after it other elements of the same alien culture-pattern.

³ Examined on pp. 542-64, above.

THE BYZANTINE INSPIRATION OF THE
RUSSIAN POLITICAL ÊTHOS

IN the first draft of the chapter to which this Annex attaches, the writer assumed that the autocratic régime that was built up in Muscovy in and after the fourteenth century of the Christian Era had drawn its inspiration from the Byzantine political tradition; but the comments on this draft which he received from B. H. Sumner¹ and from Prince D. Obolensky convinced him that the Muscovite political institutions which took shape during the period of Mongol ascendancy over Eastern Russia were, for the most part, home-grown responses to the challenge of pressure from alien civilizations on two fronts: from a Eurasian Nomad Society on the south-east and from a Western Christian Society on the north-west. At the same time the historical evidence still seemed to the writer to indicate that the political climate of a Russian Orthodox Christendom, in which a home-grown Muscovite autocracy had found so favourable an environment for establishing itself, had been predominantly Byzantine in its origin.

One consequence of the supremacy which a resuscitated Imperial Régime had established over the Orthodox Christian Church within the frontiers of the East Roman Empire in the course of the eighth, ninth, and tenth centuries of the Christian Era² had been that, when a hitherto independent pagan state received Christianity from the East Roman Church, it could not place itself under the ecclesiastical authority of the Oecumenical Patriarch at Constantinople without thereby implicitly acknowledging the political sovereignty of the Oecumenical Patriarch's secular lord and master the East Roman Emperor.³ This political implication of conversion to Orthodox Christianity was, as we have seen, the cause of a war to the death between the East Roman Empire and a converted Bulgaria that was responsible for the breakdown of the main body of Orthodox Christendom in the very generation in which Russia was entering the Orthodox Christian fold. This juridical consequence of conversion was in practice much less serious for the Russians than it had been for the Bulgarians, because Russia, instead of lying, as Bulgaria lay, on Byzantium's threshold, was insulated from the East Roman Empire by the double barrier of the Black Sea and the Eurasian Steppe;⁴ and the princes of Kiev and her successor-states, including Muscovy, appear to have acquiesced, with only a few symptoms of restiveness, in the East Roman Empire's pretension to a political supremacy over the Oecumenical Patriarchate's Russian ecclesiastical subjects throughout the period of more than four centuries' length that elapsed between the enthronement of Theóemptos, the first Greek Metropolitan of Kiev, in A.D. 1039 and the extinction of the last remnants of the East Roman Empire by the 'Osmanlis in A.D. 1453-61.⁵

¹ See VI. vii. 577-9.² See IV. iv. 592-612.³ See IV. iv. 377.⁴ See p. 152, n. 6, above.⁵ See pp. 399-400, above.

'The fourteenth-century rulers of Muscovy', Prince Obolensky observes in a note on the present writer's first draft, 'continued to acknowledge, at least in theory, the quasi-religious sovereignty of the Byzantine Emperors, whose oecumenical authority and legislative power were still recognised in Russia in the fifteenth century: thus, for example, the Emperor John VI Cantacuzenus wrote to the Grand Prince Symeon of Moscow (*fungebatur* A.D. 1340-53): "Yes, the Empire of the Romans and the most holy and great Church of God are, *as you have written*, the source of all piety and the school of law and sanctification". And the Grand Prince Basil II of Moscow (*fungebatur* A.D. 1425-62), writing to the Emperor after the Council of Florence, calls him "the pious and holy autocrat of the whole Universe".'

Considering that the juridical sovereignty of the East Roman Empire was thus acknowledged by Russian princes, including the latter-day Grand Dukes of Muscovy, over a Time-span of more than four centuries, it is hardly credible that the political *éthos*, as distinct from the administrative institutions, of a Russian Orthodox Christendom should not have been deeply influenced by the political *éthos* of 'the Second Rome'; and W. Weidle is surely right in stating, in his brilliant *Russie Absente et Présente*,¹ that 'les conceptions politiques investies dans l'ancien État moscovite étaient de provenance byzantine'.

By contrast, the *éthos*, as well as the institutional structure, of a post-Muscovite Petrine autocracy in Russia was manifestly derived from a contemporary Western World, and the writer would agree with Prince Obolensky's view 'that Peter's "enlightened autocracy" owes far more to contemporary Western models than to any Byzantine prototype', and that 'Peter's ecclesiastical reform, which led to the partial subjection of the Russian Church to the Imperial power in the eighteenth and nineteenth centuries and to the breakdown of that relationship between the spiritual and temporal powers which Medieval Russia had inherited from Byzantium, was based on Western Lutheran, not East Roman, models.' The writer of this Study would, however, go on to point out that this seventeenth-century Western 'enlightened autocracy' proves, on a scrutiny of its origins, not to have been a native Western product; for its lineage can be traced back through the Late Medieval North Italian despots to the Holy Roman Emperor and King of Sicily, Frederick II Hohenstaufen; through Frederick to the Norman founders of a Sicilian and Apulian successor-state of the East Roman Empire; and through them to the East Roman Empire itself.²

The writer would also venture to suggest an amendment to Prince Obolensky's view that 'the notion of a purely secular state, regarded as the source of all authority and legislation and the ultimate object of men's loyalty, and in which the clergy are no more than civil servants whose very spiritual authority is delegated to them by the Government, would, from the Byzantine view-point, have seemed a strange aberration.' On the writer's interpretation of the Byzantine *Weltanschauung*, it would indeed have seemed to a Byzantine critic strangely naïve, inelegant, and impolitic, to the point of being shocking, for an East Roman

¹ Paris 1949, Gallimard, p. 73, quoted on p. 395, above.

statesman to claim in so many words—as a Western Frederick II and his eventual Lutheran successors were to stake their claim—that the Secular Power was the source of spiritual as well as temporal authority; but assuredly it would also have seemed, in Byzantine eyes, no less strangely incompetent and irresponsible for the secular Power to refrain from exercising *de facto* an effective control over the Church which, until the East Roman Empire fell on evil days, was always within an East Roman Emperor's grasp so long as he took care not to commit the gross Frankish Frederician indiscretion of publicly laying claim to this 'totalitarian' authority *de jure*.

THE CONFLICT OF CULTURES IN THE SOUL OF SOLOMÓS¹

THE career of the conventional Italian poet Dionisio Salomone, who became the original Greek poet Dhionýsios Solomós, is one of the curiosities of the history of the transmission of culture. His genius found its opportunity for making its literary fortune thanks to the lucky accident of his being the bastard son, by a Zantiot Greek servant-girl, of a Zantiot landowner—Venetian in culture and origin, though Orthodox in religion—who, on his death-bed, married Dionisio's mother and left Dionisio and his brother handsome shares of his estate. At the age of ten, Dionisio was sent by his guardian to Italy for his education, and he remained there for ten years on end (A.D. 1808–18), first at Venice, then at Cremona, and finally at the Venetian university of Padua. During these years in Italy he received a thorough schooling in Italian and Latin literature; made friends with Monti, Manzoni, and other Italian men of letters; and became a disciple of the Western Romantic movement. After his return to Zante he joined an aristocratic Italianate literary circle there whose parlour-game was the extemporization of sonnets in Italian on some given subject or given set of line-endings; and there seemed no reason why he should not end his days in this conventionally cultivated obscurity.

Solomós found his true *métier* when, after the outbreak of the Ottoman Greek insurrection in A.D. 1821, a Mesolonghiot patriot-publicist, Spiridhòn Trikoúpis, visited him in Zante at his country villa in A.D. 1822 and invited him to become the Dante of a Greek Parnassus. 'I don't know Greek', Solomós replied, meaning that he had never been taught the Byzantine ecclesiastical Attic *koiné*. 'The language which you imbibed with your mother's milk is Greek', Trikoúpis retorted, meaning that Solomós could have communicated with his low-born mother in no other tongue than her Zantiot Romaïc Greek patois. Thereupon Solomós sprang into fame by composing in this mother tongue of his, in Italian metres, Western poetry, first in Byron's vein and later in Schiller's. Thanks to his being a Heptanesian aristocrat, Solomós was a highly cultivated man who did speak one of the dialects of living Greek as his mother tongue without knowing the dead language. In the early nineteenth century the Ionian Islands were perhaps the only place in Greek Orthodox Christendom where this could have happened, and the composition of Western poetry in living Greek—without murdering the language by trying to transform it into a resurrected Attic—was Solomós' inestimably valuable service to a new Greek nation that was seeking to enter the Western comity.

Solomós' work suffered, nevertheless, from another form of pedantry that was likewise inimical to poetry. His method of composing a Romaïc Greek poem was to take Italian notes, expand these into Greek

¹ See Jenkins, R.: *Dionysius Solomós* (Cambridge 1940, University Press).

prose, and then hammer this prose into verse! And in his latter years, when his mental vigour was on the decline, he relapsed into writing his poetry in the Italian which, in spite of his Romaic Greek *tours de force*, was, from first to last, his natural medium of literary expression. Moreover, his invincible native Westernism, which made him so effective a psychopompus for Greek souls seeking initiation into the Western culture, also inhibited him from going out to meet his Ottoman fellow Greek Orthodox Christians in deed as well as in word. When, on the eve of the fall of Mesolónghi, just across the water, the cannonade bombarded his ears in his peaceful villa on Zante, he suffered anguish but did not seek relief by going to the front in defiance of British regulations; and, though he lived on for a quarter of a century after a fragment of the Ottoman Empire had been transformed into a sovereign independent Kingdom of Greece with its capital at Athens, he preferred to end his days at Corfu under a British régime.

'In the days when I was young', wrote the Moreot klepht Kolokotronis, who had taken refuge on Zante in A.D. 1806, 'Zante seemed as far away as the ends of the Earth do now. What America is to us now—that is pretty well what Zante was to them [i.e. to the *fin-de-siècle* Moreot Ottoman Greeks]. When they went to Zante, they called it "going to the Western World" ("Phrangia").'¹ Solomòs' career testifies that, in the feelings of a Zantiot aristocrat who was younger than Kolokotronis by the span of a whole generation, an adjacent ex-Ottoman Morea was still the *alter orbis* that an adjacent ex-Venetian Zante had been to the Moreot klepht in days before Solomòs was born.

IX. B (ii) (a) 2, ANNEX II

THE MOREA ON THE EVE OF THE UPRISING
OF A.D. 1821

In A.D. 1821 the eyālet of the Morea did not include the Mani, which, since A.D. 1776, had been under the jurisdiction, not of the Vālī of the Morea, but of the Qapudān Pasha. On the eve of the uprising of A.D. 1821 the population of the eyālet, excluding the Mani from the reckoning, is estimated to have been about 400,000, of whom about 360,000 were Greek and Albanian Orthodox Christians and about 40,000 were Turkish and Albanian Muslims.¹ The Turkish Muslim Moreots were concentrated in the towns: Corinth, Návplia, Mistrà, Monemvasía, Kóron, Navaríno, Arkadhía, Pátras, Phanári, Leondári, Gastúni, Módhon. The populations of Návplia, Kóron, Módhon, and Navaríno were exclusively Muslim; those of Tripolítsa and Corinth were mixed in approximately equal proportions. Except in these two last-mentioned towns, the Christians, where there was a Christian element in the urban population, lived in separate quarters from the Muslims.²

At the same date about three-quarters of the agricultural land in the Morea is estimated to have been in the hands of the Muslim 10 per cent. of the population, and only one quarter in the hands of the Christian 90 per cent.: 41·7 per cent. of the land was accounted for by Imperial Ottoman fiefs, which were, of course, conferred on Muslim fiefcees; another 25 per cent. was accounted for by Muslim privately owned real estate; and the remaining 33·3 per cent. by Christian privately owned real estate.³ The Muslim, as well as the Christian, estates were, however, cultivated by Christian tenants and hired labourers, who were at liberty to change their employers;⁴ and the Christians, including labourers and tenants as well as freeholders, are estimated to have received 87·5 per cent. of the annual value of the agricultural produce, as against 12·5 per cent. received by the Muslims, who thus took only about 25 per cent. more than what would have fallen to them under a strictly proportional allocation.⁵

It will be seen that the economic conditions in the Morea between A.D. 1715 and A.D. 1821 were not seriously inequitable, and during the same century the administrative arrangements were remarkably favourable to the Orthodox Christian population or (it would be more accurate to say) to an Orthodox Christian oligarchy.⁶ A system of local self-government, dating from the preceding period of Venetian occupation, had been maintained in the Morea after the Ottoman reconquest; and this self-government was not confined to the communes but extended to the departments (*Turcicè qazās*; *Graecè ἐπαρχίαι*) and to the province (*Turcicè eyālet*) as a whole.⁷ In each commune the aldermen (*Turcicè*

¹ See Sakellarios, M. V.: *Ἡ Πελοπόννησος κατὰ τὴν Δευτέραν Τουρκοκρατίαν, 1715-1821* (Athens 1939, Byzantinisch-Neugriechische Jahrbücher), p. 226.

⁵ See *ibid.*, p. 53.

⁶ See *ibid.*, p. 95.

⁷ See *ibid.*, p. 87.

khōja-bāshys; *Graecè* δημογέροντες) were elected annually,¹ and these in turn elected the Christian members (*Graecè* προεστῶτες) of the council of the voyevoda of the department, who in their turn, again, collectively constituted a provincial assembly which elected the two Christian members (*Graecè* μωραγιάνιδες) of the vāli's permanent council of five members including, besides the two Christian deputies, two Muslims and one Christian dragoman.² Moreover, the Greek Orthodox Christian community in the Morea had two or three political agents (vekils) accredited to the Porte at Constantinople.³

'It can be said that [the departmental προεστῶτες] shared the administrative power with the voyevoda and the judicial with the qādi. They concentrated so much power in their hands that they were able fearlessly to hold their own against the Turkish authorities on their own level. Without their assent, no taxation could be imposed either for local or for general purposes. They were able to refuse to carry out orders of the voyevoda's if they considered these inexpedient. . . . If there were complaints against the voyevoda, and they had the qādi's concurrence, they could proceed at once to depose the voyevoda, subject only to referring their action retrospectively to the vezir [i.e. the vāli].'⁴

Sakellarios concludes⁵ that 'the προεστῶτες were the real rulers of their department'. A Moreot Greek Orthodox Christian born in A.D. 1798 saw the Ottoman régime in the Morea in its last phase in a more jaundiced light that does not necessarily give a more objective picture:

'The people appointed on their own initiative a headman (πρωτόγερος) or crier to carry out the general purposes of the commune and to give notice in the evening of any corvée on behalf either of the commune or of the Government. This notice was cried in the following terms: "Oyez! Oyez! to-morrow no one is to go about his own private business, because we are going to do so and so". Anyone who ignored the notice suffered for it; his neighbours wrecked his house; and, if he complained to the Government, the Government paid no attention—unless it were to punish him for insubordination . . .

'In every large village, and sometimes in small ones, they had an alderman (γέροντας) or two aldermen, according to the size of the population, who, in collaboration with the priests, assessed the taxes imposed on the commune among its individual members in accordance with their means . . .

'Whenever the potentate chose to oppress a town or a family, he would send a government official straight away and would demand whatever he chose, and the inhabitants, as I have said, would assess among themselves what was required, whether it was a money payment or some form of corvée, through the agency of the aldermen. The Turks had to allow their ra'īyeh all these rights in order that they might prosper and be at the Turks' disposal as slaves. On this account they looked after our well-being, and everyone among the ra'īyeh had some important Turk for a patron, while the whole commune in each town and village likewise had

some powerful patron for its own special preservation and protection. In the large towns, however, things were rather better, owing to their more advanced development.¹

At the same time there was complete religious toleration in the Morea;² by the turn of the eighteenth and nineteenth centuries the behaviour of the Moreot Muslims towards their Christian fellow Moreots had become less harsh,³ and the Muslim Moreot minority was becoming assimilated in its culture to the Christian majority. The Moreot Turks spoke and wrote Greek, and even the 'ulemā swore by Christ and by the Panayía.⁴ The Albanian Muslim Moreots, who were new-comers in A.D. 1715,⁵ were wilder and fiercer than their Turkish coreligionists; yet the Varduniots in their fastness in the Southern Taygetus and the Laliots and their neighbours at Phlóka in their fastness on Pholoë all bore Christian as well as Muslim names.⁶ Meanwhile the Moreot Greek Christian oligarchs betrayed their provincialism by continuing to cultivate an Ottoman Muslim style of living which had long since been in process of being abandoned in favour of a Western style by the sophisticated metropolitan Phanariots.

"The khōja-bāshy imitated the Turk in everything, including dress, manners, and household. His notion of living in style was the same as the Turk's, and the only difference between them was one of names: for instance, instead of being called Hasan the khōja-bāshy would be called Yānni, and instead of going to mosque he would go to church. This was the only distinction between the two. All the same, the Turk would cut off the khōja-bāshy's head whenever he chose, and keep his corpse exposed for three days in public, with the head placed by the backside as an additional humiliation, whereas the Turk's head would be placed under his arm-pit. From these facts you will be able to judge whether the khōja-bāshy was, or was not, a popularly elected magistrate."⁷

IX. B (ii) (a) 3, ANNEX I

THE PEASANT MAJORITY OF MANKIND AND THE AGRARIAN POLICY OF THE SOVIET UNION

To see the problem of a depressed peasantry in India in its true perspective, we must extend our field of observation far beyond the Indian sub-continent's limits; for this depressed peasantry in India was one contingent of an immense host of human beings in the same plight which, at the time of writing, still accounted for perhaps not less than three-quarters of the living generation of Mankind¹ and which was massed, not only in India, but in Indonesia, Indo-China, China, Japan, the Soviet Union, Eastern Europe, Egypt, and those superficially Latinized 'Indian American' countries, from Mexico to Bolivia inclusive, which had inherited an indigenous peasantry from the submerged Central American and Andean civilizations.²

Could the condition of this vast and widespread rural depressed class be effectively improved by any orthodox devices of Modern Western democratic 'social engineering'? To be democratic in the Modern Western sense of the term, the solution of the problem must be one which could be introduced by consent, without having to be imposed by coercion; and it remained to be seen whether the peasantry, in its prevailing mood of self-assertiveness and expectancy not yet illuminated by more than a glimmer of intellectual enlightenment, would voluntarily agree to the things necessary for its economic salvation. The peasantry's divers desires at this time seemed, indeed, likely to prove mutually incompatible. The peasants now wanted an improvement in their material condition, but they also still wanted to go on living their customary life and using their traditional agricultural technique; and the ambition of

¹ According to E. M. Patterson, *An Introduction to World Economics* (New York 1947, Macmillan), p. 5, Table I, following and supplementing A. M. Carr-Saunders, *World Population: Past Growth and Present Trends* (London 1936, Oxford University Press), p. 42, 'Europe', including the whole of the Soviet Union, and North America, excluding Mexico, together contained 33.2 per cent. of the total population of the World in A.D. 1938. To arrive at an approximate estimate of the respective percentages of non-peasants and peasants in the total population of the World at that date, we have to allow on the one side of the account for a small non-peasant minority in Asia, Africa, Oceania, and South and Central America, and on the other side for a large peasant majority in the Soviet Union and in the adjacent countries of Eastern Europe. On this basis the ratio of the peasant element in the population of the World in A.D. 1938 would work out at something like 75 per cent.; and it would be still higher if calculated on the population estimates for mid-year A.D. 1950, given in the *United Nations Demographic Year Book, 1951* (New York 1951, Statistical Office of the United Nations). The estimate, as at this date, for the aggregate population of the predominantly non-peasant parts of the World (the United States, Canada, Australia, New Zealand, and Western Europe) amount to about 487,637,000, and those for the predominantly peasant remainder of Mankind to about 1,910,989,000; and, on this reckoning, the peasant element will have accounted for not much less than 80 per cent. of the World's total population in A.D. 1950.

² Paraguay, where a native American Indian population had been initiated into the arts of Civilization by Jesuit Roman Catholic Christian missionaries from the Old World, should be added to this list. The Jesuits' achievements in Paraguay have been noticed on pp. 597-8, above.

every peasant household was not only to own a plot of land but to work its own plot as a separate unit of labour and production. Yet, short of there being any hope of raising their standard of living, there might be no chance of saving it from being further depressed to a nadir which would be disastrous for them and for the World as a whole, if the other points in the peasants' dimly conceived programme were to be treated as sacrosanct. Could this rustic Gordian knot be untied? Or could it only be got rid of by being cut? And, if it should prove impossible to avoid a summary operation, what scabbard was to furnish the latter-day counterpart of Alexander's sword?

Could the problem of this vast non-Western peasantry be solved by a culturally alien Modern Western régime such as the late British Rāj in India? Probably not, since an alien régime can seldom venture to interfere with the deep-seated prejudices of its subjects,¹ however well placed it may be for carrying out useful reforms on the surface of life. Then could the task be achieved under the régime of a native intelligentsia of the kind that, in India, had become the British Rāj's heir? Such rulers might perhaps be expected, *a priori*, to have better prospects of success in commending a policy framed by their Westernized minds to a peasantry from whom their hearts were not altogether alienated. Yet in A.D. 1948-9 Pandit Nehru and his colleagues must have felt some misgivings as they looked on from India at the death agonies in China of a Kuomintang régime which was so similar to their own in composition, character, and outlook, and which had come to power in China little more than twenty years before the Congress régime's own advent to power in India. In those few years the Kuomintang had rapidly degenerated from being the generous apostles of the Ideas of the French Revolution into becoming the corrupt conservators of traditional Chinese vested interests; retribution for this breach of trust had been no less quick to overtake them; and this nemesis had taken the form of a mass-secession of the Chinese peasantry from the Kuomintang to the Communist camp. Was Communism now to take its turn in trying to solve in China a problem with which an abortive Chinese experiment in Modern Western Democracy had failed to come to grips? And, if this was to be the next chapter of Chinese history, was that a portent of what was likely to happen next in other non-Western societies in which an antique peasantry was likewise being shaken out of a long-established psychological and economic inertia by the impact of Modern Western Democracy and Technology?

In bidding for a mandate to take the world-wide problem of the peasantry in hand, Communism had at any rate one strong card to play mid-way through the twentieth century. At this date its advocates could argue that, of all the societies that were saddled with the problem, Russia was the only one so far in which an effort to grapple with it had been made on a scale and with a vigour that were worthy of the greatness and the gravity of the challenge; and they could go on to point out that

¹ The British Rāj in India had nevertheless ventured to use its power to put down infanticide, sati, and the self-immolation of the devotees who had formerly offered themselves year by year to be crushed to death by Juggernaut's car.

this notable effort in Russia had not been made until after the establishment there of the existing Communist régime.

This was, indeed, one of the points in which Lenin and his companions could justly claim to have done in Russia a deed of pressing urgency and momentous importance that had been perpetually left undone by their Western-minded predecessors; for neither Tsar Peter the Great nor Tsar Alexander II had attempted to solve the problem of the peasantry in the terms in which their Communist successors envisaged it.

Peter, indeed, had not tried to solve it at all, but had actually aggravated it by piling a top-heavy superstructure of Modern Western military organization and civil administration upon the frail foundation of a traditional rural economy which he had neglected to reinforce without calculating whether it would be capable of bearing the additional load that he was remorselessly laying upon it. Peter made no serious attempt to increase the agricultural production which was virtually the sole economic resource of the Russia of his day, and, so far from relaxing the legal obligations of the serfs to their owners, he tightened them up in pursuance of a short-sighted policy of using the institution of serfdom as an agency for the indirect collection of public revenue from the peasant producers of Russia's national income through the direct taxation of the personal incomes of the serf-owners.¹

¹ Peter had little cognizance of the sufferings inflicted on the population of his empire by the social heritage of Russian Orthodox Christendom and by his own innovations (Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 513); he was concerned to place taxation on a statistical basis (*ibid.*, p. 513), and he looked at the peasantry primarily from a fiscal standpoint (p. 524). Hence he not only rejected the idea of emancipating the peasants (p. 524), but actually increased the powers of the landlords over their serfs with a view to increasing the landlords' tax-paying capacity (p. 523). The fugitive serf laws were made more stringent (p. 296); the practice of selling serfs apart from the land to which they were attached, which had occurred for the first time in A.D. 1675, became frequent in Peter's reign (p. 523); industrialists were permitted to buy peasants as a means of providing themselves with man-power (p. 523); freeholders disappeared (p. 523). The truth was that Peter did not care for agriculture, and the result was that he made the condition of the Russian peasantry still worse than it had been before his time (p. 522).

This deterioration in the peasantry's condition went on in Russia under the Petrine régime until A.D. 1861 (Metigg, C.: *Die Europäisierung Russlands im 18. Jahrhundert* (Gotha 1913, Perthes), p. 439), on the principle, established by Peter himself, that the state should lend its power to force the serf to work for his master in consideration of the work performed by the serf-owner for the state (*ibid.*, p. 441). In A.D. 1747 the nobility were given the right to sell their serfs, and in A.D. 1760 the right to send them to penal servitude in European Russia or to exile in Siberia (p. 418). Passages recommending the emancipation of the serfs, which had been included in the first draft of the Empress Catherine II's celebrated instructions for the abortive legislative commission that met in Moscow in A.D. 1767-8, were omitted from the final draft at the instance of the Empress's advisers (p. 246). In A.D. 1780-3 the Great Russian institution of serfdom was introduced into the Ukraine (pp. 255 and 443).

In Northern Russia, which had been opened up in relatively recent times and where the individual initiative of the pioneer settlers was still reflected in the frequency of peasant proprietorship, the Imperial Government was forcing communal ownership of the land upon the local peasantry in the fourth decade of the nineteenth century (Metigg, *op. cit.*, p. 447). The village communities (*mir*s) were apt to treat rich peasants as the municipal *curiales* had been treated in the western provinces of the Roman Empire in the fourth and fifth centuries (*ibid.*, p. 448), and the Imperial Government, for its part, was hostile (p. 448) to the growth of a class of well-to-do peasants (the class pilloried as *kulaks* by the subsequent Communist régime). Even under the emancipation scheme of A.D. 1861, the ownership of the land, in so far as it passed out of the hands of the former serf-owners, was acquired communally by the *mir* and not individually by the peasants composing the village community, and the Imperial Government forced

As for Tsar Alexander II, his success in securing the abolition of serfdom with the former serf-owners' acquiescence was, from a Modern Western standpoint, certainly the greatest achievement of Russian statesmanship under the Petrine régime, and perhaps the greatest under any régime that had ever ruled in Russia down to the time of writing. In this act an autocratic empire which was a recent convert to the Modern Western way of life showed itself a more sincere and more effective devotee of Modern Western liberal ideals than the ostensibly democratic Southern States of a republican American Union whose slave-owning citizens were children of the Western Civilization by birth and not by adoption. The same decade of the nineteenth century which saw a voluntary emancipation of the serfs in Russia saw these American slave-owners bring disaster and disgrace upon themselves by driving their Northern fellow countrymen to abolish slavery in the South by *force majeure*, at the cost of a civil war, as a penalty for the Southerners' own persistent failure to rid themselves of their 'peculiar institution' on their own initiative. Yet, in relieving Russia, by bloodless revolution,¹ of her institutional agrarian malady, Tsar Alexander II did nothing to cure her technological agrarian malady; for the legal change in the peasants' personal status was not accompanied by any appreciable change in methods of cultivation. About half the total arable land of Russia continued to be cultivated by the peasants individually for their own benefit,² and about half by their former masters on a larger scale of agri-

the *mir* to serve, in place of the former serf-owner, as its instrument for collecting public revenue from the peasants and keeping them under governmental control.

Though in the latter days of serfdom in Russia there were enlightened serf-owners who, in their treatment of their serfs, distinguished themselves by their philanthropy (Metigg, op. cit., p. 449), the landowners as a class were out of touch with the peasantry, as Peter the Great had been, and this was true of the circles from which the 'Decembrists' of A.D. 1825 were drawn (*Le Monde Slave*, Nouvelle Série, 2^{me} Année, No. 12, December 1925 (Paris 1925, Alcan): 'Centenaire des Décabristes', p. 366). The 'Decembrists' were military officers recruited from the landowning nobility. The private soldiers, who were recruited from the nobility's peasant serfs, were apt, for their part, before they had worked out their sentence of twenty-five years' military service, to lose a contact with the peasantry that their officers had never possessed (*ibid.*, pp. 366-7).

¹ Though, unlike the abolition of slavery in the Southern States of the American Union, the abolition of serfdom in Russia was achieved without the owners having to be coerced by defeat in a civil war, the Russian reforms in the eighteen-sixties were undoubtedly accelerated and facilitated by the antecedent defeat of Russia in a war against foreign adversaries. The Crimean War (*gorebatur* A.D. 1853-56) was a military reverse abroad which opened the way for a triumph of Liberalism at home by bringing to a discreditable end the oppressive reign of Tsar Nicholas I (*imperabat* A.D. 1825-55). Such harvesting of liberal reforms at home from military reverses abroad was, indeed, characteristic of Russian history in the nineteenth and twentieth centuries. The abortive liberal revolution of A.D. 1905 was the fruit of defeat in the Russo-Japanese War of A.D. 1902-4, and the abortive liberal revolution of A.D. 1917 the fruit of defeat in the General War of A.D. 1914-18. Conversely, military successes abroad were apt, in this chapter of Russian history, to play into the hands of political reactionaries on the home front. The tyrant Nicholas I was the principal beneficiary from the Russian people's victory over a French invader of Russia in A.D. 1812, and this tyrant's hold on Russia was confirmed by the victories of his armies over the Turks in A.D. 1829 and over the Poles in A.D. 1831. The working of the same ironical law of Russian history revealed itself again when the Russian people's victory over a German invader of Russia in A.D. 1940-5 served to clamp upon their shoulders, more tightly than ever, the yoke of a Soviet Communist régime.

² The peasants were still more eager to preserve and enlarge the allotments of land which they cultivated individually for their own benefit than they were to obtain their personal freedom from the bondage of serfdom. Their attitude was indicated in a reply which an inquiring nineteenth-century serf-owner, I. Zakushkin, drew from his own

cultural operations; and the fact that the peasants now cultivated their land as free men, and the larger landowners theirs with hired instead of servile labour, did not have any magic effect upon a stagnant agricultural technique.¹

No doubt, in contemporary France and Belgium and Denmark, peasant proprietorship might be wedded with specialization in agricultural production and technique to yield increased economic returns thanks to the auspiciously combined effects of the richness of the soil, the proximity of favourable markets, and the peasant's personal industry, intelligence, and zeal in working as his own master; but these achievements of peasant proprietorship here and there in Modern Western Europe were irrelevant to the situation in contemporary Russia. In the vast inefficiently cultivated expanses of Russia, agricultural productivity could be increased only by mechanical cultivation on the grand scale, and this was the radical reform which the Soviet Communist régime had dared to impose by force on a Russian peasantry which would never have adopted it of its own volition.

After the Bolsheviks had incited the peasantry to bring them into power on a mandate to distribute the lands that Alexander II had left in the possession of the *ci-devant* serf-owning landlords, a duly established Communist régime used the power which they owed to the peasants' support in order to reverse the policy by which this support had been purchased. They took out of the peasants' hands by force not only the lands which Lenin had distributed among them individually but also those which had been left in their hands by Alexander, and they rode rough-shod over the peasants' habits, prejudices, and aspirations by compelling them to cultivate virtually all the land thenceforward in large-scale mechanized collective farms. It could hardly be denied that the Russian peasantry had been first deceived and then coerced by their demonic latter-day rulers, but it would have been more difficult to refute the Soviet Government's contention that the Russian peasantry and, with them, Russia herself had been dragooned into economic salvation by this high-handed and unscrupulous act of state. If it is possible for human beings to be saved in spite of themselves, and, if physical survival is not too dearly bought at the price of forfeiting both liberty and happiness, the Soviet Government might claim to have been the Russian peasantry's saviour from economic disaster; and, since the establishment of their ascendancy over the peasant countries of Eastern Europe after the general war of A.D. 1939-45, they had seen to it that the same medicine should be administered to the agrarian economy of these satellite states by the puppet governments that had been hoisted into office there on the points of Russian bayonets.²

serfs: 'We belong to you, but the land belongs to us' (*Le Monde Slave*, Nouvelle Série, 2^{me} Année, No. 12, December 1925 (Paris 1925, Alcan): 'Centenaire des Décabristes', p. 368).

¹ There had been little change in agricultural technique in Russia since the introduction of a money economy in the sixteenth century (Mettig, C.: *Die Europäisierung Russlands im 18. Jahrhunderte* (Gotha 1913, Perthes), p. 390). The *raskolniki* (i.e. the archaizing dissidents from a Romaicizing Russian Orthodox Church) had refused to cultivate potatoes from a feeling that any new food-plant must be Satanic (*ibid.*, p. 396).

² The agrarian social policy of the Communist Party in the Soviet Union and its

In A.D. 1952 it was impossible to foretell whether the same destiny was in store for the Chinese and Indian peasantries in their turn. At this stage all that could be seen was that the problem of the starveling peasantry had now been placed on the agenda for the governments of all countries where such a peasantry was still to be found, and that in the handling of this problem the Communists now held the initiative. This was as much as to say that this problem had now become crucial for the Modern Western World. At the time, no doubt, the Western Society's first concern was to put its own house in order; but a successful achievement of this urgent and difficult task at home would not suffice to ensure the West's salvation; for even an internally united Western World would find itself in a precarious position in the World as a whole if the great peasant majority of Mankind were to be gathered into the Communist fold; and this might be the peasantry's cultural destiny if the Modern Western way of life failed to offer any practical prescription for the peasantry's economic malady; for in that event the Communists' prescription, however unpalatable in itself, would hold the field *faute de mieux*.

satellites was all of a piece with their social policy for the urban industrial workers. In town and country-side alike, they were deliberately creating a proletariat of the kind which, in nineteenth-century England, had been heedlessly brought into existence as a social by-product of the private economic enterprise of farmers and industrialists. The children of these English employers of rural and urban labour had taken stock of the social result of their fathers' economic handiwork, and had seen that it was very bad, long before the Communist critics of Western Capitalism had come into power in Russia and had used this power to create the very social conditions which were being denounced by them elsewhere. If a proletariat may be defined as a class whose members have no personal stake in the society in which they find themselves, and no say in the ordering of their own lives, the twentieth-century workers in the factories and collective farms of the Soviet Union would pass this test as well as the factory workers and agricultural labourers of a nineteenth-century Great Britain. No doubt a spokesman of Communism would lose no time in reminding a bourgeois observer of one obvious difference in the situation of the proletariat in a communist and in a capitalist country. Whereas in a capitalist country the proletariat's masters were private employers, in a communist country the proletariat's sole master was the state. The difference was certainly an important one; but, if the proletariats of the Soviet Union and the Western World could have compared notes in A.D. 1952 on the relative rigours of their respective lots, the proletarian employees of an omnipotent totalitarian state would probably have been judged to be more helplessly at the mercy of their masters than those of even the most powerful and oppressive private employers under a régime of free individual economic enterprise.

IX. B (ii) (a) 3, ANNEX II

SOME HISTORICAL CLUES TO THE RIDDLE OF PAKISTAN'S FUTURE

DURING the century and three-quarters that had elapsed between Russia's acquisition of a sea-board on the Black Sea in A.D. 1774 and the transfer of the responsibility for India's security against foreign aggression from British to Indian hands in A.D. 1947, the imaginations of British strategists and statesmen had been haunted by the bogey of a Russian descent upon India from the Central Asian side of the Hindu Kush. Was this British anxiety to be inherited by the Indian heirs of a British Rāj? In Indian minds in A.D. 1948-49 that question could hardly fail to be raised by the spectacle of a sweeping triumph of Communism in China. Perhaps an Indian student of history might seek comfort in recalling that, when, in the thirteenth century of the Christian Era, all the rest of Asia, up to the Euphrates and the Halys and the Carpathians, had been overrun by the Mongols, the Indian sub-continent alone had remained unmolested by world-conquerors who were lowering upon India simultaneously from a subjugated Burma and from a subjugated Afghanistan. Yet, if our Indian knew his history well and could bring himself to read its lessons without flinching, he might be driven to conclude that India's escape from the Mongols, like her encounter with the English, was an exception to an historical rule that India's foreign conquerors were usually to be looked for across the Hindu Kush; and, if he was also a student of political geography, the new political map that had emerged from the partition of an ocumenical British Indian Empire into three successor-states would call up in his visual memory some disquieting reminiscences.

The main body of Pakistan—extending, as it did, from the south-eastern foothills of the Hindu Kush to the coast of the Indian Ocean at the delta of the Indus—would remind him of the Transaropanisian limb of the mountain-besriding empire of the Bactrian Greeks and their Kushan, Ghaznawī, Ghūrī, and Durrānī¹ successors; and, if he went on to search the contemporary map for counterparts of the other members of this geographically paradoxical yet historically familiar composite body politic,² these would leap to his eye in the contemporary shapes of Afghanistan and the Central Asian Republics of the Soviet Union. In the second century B.C. and in the first, the eleventh, the twelfth, and the eighteenth century of the Christian Era, Central Asian empire-builders with a land-locked base of operations within the borders of the territories latterly known as Afghan and Soviet Uzbekistan had forced the passage of the Hindu Kush and cleft their way through Indian territory down the valley of the Indus till they had carried their

¹ Previously known as Abdālī.

² This remarkable recurrent political phenomenon of an empire besriding the Hindu Kush has been investigated by Sir W. Kerr Fraser-Tytler in *Afghanistan* (Oxford 1950, University Press), *passim*, but especially Part III, chap. 1.

advancing south-eastern frontier to the shores of an open sea; and in the twentieth century it required no great stretch of the political imagination to envisage a fresh repetition of this recurrent episode of history. Had not the creation of Pakistan prefabricated for a future empire-builder from Central Asia the complementary Indian dominion which a Demetrius and a Kadphises¹ and a Mahmūd Ghaznawī and a Muhammad Ghūrī and an Ahmad Durrānī had been required to carve out for themselves? And, if land-locked Central Asian Powers whose metropolitan territories were confined within the modest limits of the Oxus-Jaxartes Basin had been impelled by claustrophobia to make a strenuous march to the sea across the breadth of a sub-continent, might not the same stimulus be expected to launch on the same course an empire embracing not merely a land-locked Central Asia² but the entire land-locked 'heartland' of the Old World?

Since the days of Tsar Ivan the Terrible (*imperabat* A.D. 1533-84), Russia had been seeking an outlet to an ice-free open sea. She had battered her way to the east coast of the Baltic, only to find this outlet masked by Denmark's command of the Sound; she had battered her way to the north coast of the Black Sea, only to find this outlet likewise masked by Turkey's command of the Bosphorus. The exit from Russia's remote north-western ice-free port of Murmansk was commanded by the adjoining coast of Norway; Archangel was ice-bound for half the year; Vladivostok could barely be kept open in the winter by the constant labour of ice-breakers whose crews saw the water freeze again behind them in their wake.³ These results were little to show for nearly four hundred years of Russian endeavours to reach the open sea in all directions but one. For Russia in the twentieth century, an outlet on the Indian Ocean was the sole still untried possibility. Was not Karachi a tempting bait to dangle before eager Russian eyes? And could the transfer of Karachi from British to Pakistani hands have failed to suggest 'dangerous thoughts' to calculating Russian minds?⁴

¹ Kadphises II Kushan *regnabat circa* A.D. 50-68 (see V. v. 275, n. 3.).

² The Central Asian Republics of the Soviet Union were represented at the Asian Congress, convened on Pandit Nehru's initiative, which met at Delhi on the 23rd March-2nd April, 1947.

³ The writer saw this happen with his own eyes from on board a Japanese packet-boat which made its way into the harbour of Vladivostok, piloted by an ice-breaker, on the 13th January, 1930.

⁴ A corridor to Karachi was not the only attractive possibility that the creation of Pakistan had opened up for expansive-minded Russian geopoliticians; for the shape of this Muslim successor-state of the British Indian Empire was one of the curiosities of political geography. While its main body in the Indus Valley offered an open road to Karachi from the North-West Frontier of India, its enclave in Eastern Bengal, which was separated from the main body of Pakistan by the whole breadth of the Indian Union, offered an equally inviting ingress into India across a North-East Frontier which had been opened up, in the course of the general war of A.D. 1939-45, by the building of the Burma Road. At the moment when, in China, Communism seemed to be carrying all before it, a Russian historian would have the pleasure of recollecting that in the thirteenth century of the Christian Era the Mongol cavalry had succeeded in making their way from Transbaikalia to Burma, across the whole breadth of China, without any Burma Road to speed them on their path.

THE INEFFECTIVENESS OF PANISLAMISM

THE remarkable success of the core of the Islamic World in preserving or regaining its freedom from alien political control during the 270 years that had elapsed between A.D. 1683 and A.D. 1952¹ was, no doubt, one explanation of the equally remarkable miss-fire of a nineteenth-century Panislamic Movement that was the response which the Muslims might have been expected to make to the challenge of an increasing Western and Russian pressure upon them. The nineteenth-century Muslims to whom the Panislamic programme of strength through solidarity made an appeal were those outlying Muslim communities that did lose their independence in this age.

Both the local Ottoman dominant minority and the Arab and Berber subject majority of the population in Algeria, Tunisia, and Tripolitania, for example, reversed their attitude towards the Ottoman Empire after the initiation in A.D. 1830 of the French conquest of the Maghrib. During the preceding two centuries or so, the ruling element in the Ottoman Barbary States had been bent on asserting its *de facto* independence of the Porte; from A.D. 1830 onwards both the anti-French resistance movement in Algeria and the local Ottoman régime in the now likewise threatened adjoining Ottoman principality of Tunisia began to look to the Porte for support against French aggression. In A.D. 1864 the reigning Bey of Tunis sought to strengthen his ties with the Porte by sending on a mission to Constantinople the Circassian slave-statesman Khayr-ad-Dîn, who published in A.D. 1867 a book advocating the adoption of Westernizing reforms by Muslim countries as a means towards their becoming more competent to hold their own against Western imperialism.² A further move in the same direction was made by the Tunisian Government in A.D. 1871.³

From the opposite extremity of the Islamic World, similar embassies from Central Asian Turkish Muslim rulers, soliciting the help of the Porte against Russian imperialism, began to arrive at Constantinople in the seventh decade of the nineteenth century, after the Russians had begun to direct their military energies from the by then all but completed conquest of the Caucasus to the conquest of Central Asia.⁴ In A.D. 1863 a Western traveller in Central Asia found that Central Asian khans were taking pride and comfort in being invested with honorary

offices in the Ottoman Pādishāh's household;¹ and from A.D. 1869 onwards there were contacts between the Porte and Ya'qūb Beg, the Turkī Muslim rebel against Manchu rule in the Tarim Basin. From A.D. 1873 onwards Ya'qūb caused the Pādishāh's name to be inscribed on his coinage and invoked in the *Khutbah* within his dominions, and an Ottoman mission made its way from Constantinople to his headquarters. Envoys from Afghanistan and from the Panthai Muslim rebels against Manchu rule in Yunnan also presented themselves, on similar errands, at the court of Sultan 'Abd-al-'Azīz (*imperabat* A.D. 1861-76), and in A.D. 1873 he received an appeal from the Achinese Muslims in Sumatra for help against the aggression of the Dutch.

A sentimental attachment to an idealised conception of the Ottoman Empire began to appear about the same time among the Muslim diaspora—Shī'ī as well as Sunnī—in India, as a psychological compensation for the loss of their own former imperial dominion over a Hindu majority of the population of the sub-continent and for the painfully overwhelming service which the subsequent British conquerors of India had done for these local Muslim predecessors of theirs in saving them from the vengeance of the resurgent Hindus by imposing an impartial British Rāj on both these Indian communities.

The Ottoman Empire was, indeed, the only political rallying point on which the Muslim victims of Western and Russian imperialism could fall back—not so much in virtue of her dubious and long-neglected title to the inheritance of the Caliphate as because, even in her nineteenth-century infirmity, she was by far and away the most powerful, efficient, and enlightened Muslim state in existence. At the same time, her patent weakness in this age by comparison with the encircling non-Muslim Powers made it an embarrassment rather than an opportunity for her to find herself the cynosure of nineteenth-century Muslim eyes. Out of fear of France, she forbore from making any serious response to Tunisian overtures to her between the date of the French descent on Algeria in A.D. 1830 and the date of the long-dreaded establishment of a French protectorate over Tunisia in A.D. 1881, and she was quite impotent to help the Caucasian and Central Asian Muslims in their desperate struggle to resist the imposition on them of a Russian yoke. All that the Porte could do was to take a modest advantage of the revulsion of Maghribī feeling in her favour by establishing her direct rule over Tripolitania and Cyrenaica in A.D. 1835 and to salve her conscience for her inability to assist the Maghribī and Caucasian resistance movements in the field by giving new homes in still intact Ottoman territory to Algerian and Circassian 'displaced persons' after their struggles to maintain their independence had ended in an inevitable ultimate defeat.

Thus Panislamism fell between two stools. On the one hand neither the Ottoman Empire nor, *a fortiori*, any other still independent Muslim state was capable in the nineteenth century of the Christian Era of constituting itself into an effective agency for vindicating the integrity and independence of the Islamic World as a whole, while on the other hand

¹ See Vambéry, A.: *Travels in Central Asia, 1863* (London 1864, Murray), pp. 434-5.

the fact that all but a few fragments of the core of the Islamic World had succeeded in remaining independent on a low level of vitality took the edge off the appeal of the Panislamic gospel of self-preservation through an increase of inter-Islamic solidarity. If, in the course of the nineteenth century, the whole of the Islamic World, instead of a few fragments and fringes, had been engulfed in the British, French, and Russian empires, the nineteenth-century apostle of Panislamism, the Sayyid Jamāl-ad-Dīn¹ al-Afghānī (*vivebat circa* A.D. 1838–A.D. 1897),² might have found a more favourable mission-field for his propaganda.

Jamāl-ad-Dīn's message to his fellow Muslims was twofold. They were to defend themselves against the West in the first place by transcending their own traditional sectarian and political divisions and rallying round the Ottoman Pādishāh as Caliph, and in the second place by adopting Western ideas, institutions, and techniques that were the secret of the Modern's West's strength;³ and it is significant that the Sayyid was far more successful in his advocacy of the second of these two prescriptions. In his preaching of Islamic solidarity he was, it is true, unprecedentedly successful in gaining a following among Sunnis and Shī'is alike. In a Sunnī Egypt he was the inspiration of Shaykh Muhammad 'Abduh, and in a Shī'ī Persia he moved the mujtahids in A.D. 1891–2 to crush Nāsir-ad-Dīn Shāh's attempt to grant a tobacco monopoly to a group of British *entrepreneurs*. Yet the chief practical effect of his missionary work was to promote the birth of a parochial nationalist movement in Egypt and a parochial nationalist movement in Persia, and thereby to create new, and perhaps insurmountable, obstacles to the political unification of the Islamic World under the aegis of a universal state crystallizing round the nineteenth-century torso of the Ottoman Empire. In so far as Jamāl-ad-Dīn's Ottoman admirer and patron Sultan 'Abd-al-Hamid II (*imperabat* A.D. 1876–1909) tried to translate the Sayyid's ideas into practice, he largely stultified the Sayyid's intentions by seeking in Panislamism a political prop for the declining strength of Turkey rather than attempting to use Turkey's residual strength as a pillar for the support of Panislamism.⁴

The inference from this aftermath of Jamāl-ad-Dīn's career seems to

¹ Accounts of the Sayyid Jamāl-ad-Dīn's career and ideas will be found in Browne, E. G.: *The Persian Revolution of 1905–1909* (Cambridge 1910, University Press), pp. 1–30, and in an article by Goldziher, I.: s.v. 'Djamāl al-Dīn al-Afghānī', in the *Encyclopaedia of Islam*, vol. I (Leyden 1913, Brill), pp. 1008–11.

² According to Browne, op. cit., p. 4, the As'adābād which was Jamāl-ad-Dīn's birthplace was probably not the place of that name near Kābul, which was claimed as his birthplace by the Sayyid himself, but the As'adābād near Hamadan, as asserted by Nāzīm-al-Islām of Kirmān in his *Ta'rikh-i-Biddā'i-i-Irānīyan*. If so, the Sayyid was born a Shī'ī and a subject of the Shah of Persia.

³ The Panislamic strategy of resistance to Western aggression against the Islamic World could, of course, be combined equally well with either Herodian or Zealot tactics. As an example of a Zealot-minded exponent of Panislamism we may cite the North Caucasian Panislamic leader the Amir Shaykh Uzun Hajji Khayr Khan, who was active in A.D. 1910. 'Uzun Hajji was distinguished by simplicity and directness, as much as by his fanaticism. "I am twisting a rope in order to hang all engineers, students and, in general, people who write from left to right." These words of Uzun Hajji's... (Arshurani, A., and Habidullin [?Habibullin], Kh: *Ocherki Panislamizma i Panturkizma v Rossii* [Studies in Panislamism and Panturkism in Russia] (Moscow 1931, Bezbozhnik [Anti-religious] Press), p. 67, communicated to the writer by B. H. Sumner).

⁴ 'Abd-al-Hamid's exploitation of the Ottoman Caliphate has been touched upon in VI. vii. 22–24.

be that the nineteenth-century Western and Russian pressure on the heart of the Islamic World was not sufficiently severe to make the still unsubjugated Muslim peoples feel that Western nationalism was a luxury in which they could not afford to indulge. In any case it is an historical fact that the still independent Islamic peoples Westernized piecemeal, like the Ottoman Orthodox Christian peoples, instead of Westernizing *en bloc*, like Russian Orthodox Christendom, within the political framework of a universal state.

THE EXPLOITATION OF EGYPT BY
MEHMED 'ALĪ

EGYPT was not just a passive piece of Mankind's physical environment; it was a creation of human audacity, industry, and genius out of the unpromising raw material of a forbidding jungle-swamp;¹ and, unlike its sister creature the Land of Shinar, the system of embanked and irrigated fields in the Lower Nile Valley had never ceased, even in the periods of its worst neglect, to be the going concern that had been made of it in the fourth millennium B.C. by the founders of the nomes, who had tamed the valley piecemeal, and by the subsequent founders of the United Kingdom, who had co-ordinated these works of local reclamation into a single technologically and administratively centralized concern. Through these abiding results of their handiwork, the genius of the fourth-millennium makers of Egypt set its stamp more than once in the course of subsequent history on the policy of later masters of Egypt who had sufficient genius of their own to enter into the founding fathers' labours.

The founders' original lay-out of their Nilotic estate imposed on their successors the necessity of subjecting the population to a centralized autocratic régime in order to harvest the potential productivity of a regimented soil and water—whatever the proportions in which the joint product of management and labour might afterwards be distributed between the human parties to this vast economic enterprise². This permanent idiosyncrasy of Egypt herself must be the explanation of the astonishing similarity between the régimes respectively inaugurated by Mehmed 'Alī in the first half of the nineteenth century of the Christian Era and by the Ptolemies at the turn of the fourth and third centuries B.C., since it is improbable that Mehmed 'Alī was aware, even dimly, of the methods employed by these predecessors of his who were also his Macedonian fellow countrymen, while it is impossible that he should have been familiar with the details of the Ptolemaic administration that were brought to light after his death by the excavation and study of documentary papyri. Yet so masterful was Egypt herself in dictating to her rulers the methods by which they must exploit her that a survey of the acts of Mehmed 'Alī and his son Ibrāhīm might also serve, with a mere change of names, to describe the acts of Ptolemy Soter and Ptolemy Philadelphus.

The Turkish Macedonian rulers of Egypt, like their Greek Macedonian forerunners, planted Egypt with fruit and forest trees;³ extended the area of irrigation and cultivation;⁴ dictated what crops should be

⁴ See Jabarti, Shaykh 'Abd-ar-Rahmān al-: *'Ajā'ib-al-Āthār fi'l-Tarājim wa'l-Akhhār* (French translation: Cairo 1888-1896, Imprimerie Nationale; Paris 1888-1896, Leroux), vol. ix, p. 194; Clot-Bey, op. cit., vol. i, pp. 242 and 247; vol. ii, pp. 436-7;

sown in what quantities;¹ laid out model farms and botanical gardens;² introduced new crops, of which cotton was the chief,³ but which also included silk, indigo, sugar, hemp, and opium;⁴ imported agricultural experts from abroad and sent Egyptian students of agriculture to Europe and the West Indies;⁵ and monopolized for the Government the purchase of the cotton, rice, gum, indigo, sugar, opium, and other crops.⁶

Under Mehmed 'Ali's régime in Egypt the peasants had become the Government's tenants—holding the arable land in usufruct only, and paying *kharāj*—in the course of the years A.D. 1808–14, when Mehmed 'Ali had abolished tax-farming (*iltizām*), eliminated the tax-farmers (*multazims*), and expropriated the waqf endowments invested in arable land (as distinct from gardens and houses) against compensation in the form of annuities from the public treasury.⁷ The new system of direct collection of the land-tax by the Government itself was based on a new survey of the land.⁸ By the time when the Government had also taken it upon itself to direct the peasants' agricultural operations, to supply them with the means of production, and to buy their non-cereal crops at fixed prices, the peasants had become mere hands on a state-managed plantation coextensive with the cultivated area of the country,⁹ and the

Kramers, J. H., s.v. 'Khediw', in the *Encyclopaedia of Islam*, vol. ii (Leyden 1927, Brill), p. 947.

¹ See Jabarti, op. cit., vol. ix, p. 190; Bowring, *Report on Egypt and Candia* (London 1840, Clowes), pp. 14 and 19. 'He not only compelled the fellāh to cultivate, but in some areas he determined what crops should be grown, and required the produce to be delivered into the government warehouses at a fixed rate' (Dodwell, H.: *The Founder of Modern Egypt* (Cambridge 1931, University Press), p. 218).

² See Clot-Bey, op. cit., vol. i, pp. 154–60, and vol. ii, p. 394; Bowring, op. cit., pp. 26–27.

³ Cotton culture was started in Egypt in A.D. 1821 and Sea Island cotton seed from South Carolina was introduced in A.D. 1828 (Kramers, op. cit., pp. 947–8).

⁴ See Clot-Bey, op. cit., vol. ii, pp. 260–9; Bowring, op. cit., pp. 21–22 and 23; Kramers, op. cit., p. 948. According to Bowring, loc. cit., Ibrāhīm Pasha started a sugar plantation and sugar mills, and sent a certain Ōmer Efendi to the West Indies to study rum-making. According to Kramers, op. cit., the cane-sugar culture in Upper Egypt was started only in A.D. 1867, in the reign of the Khediw Ismā'il.

⁵ See Clot-Bey, op. cit., vol. ii, p. 257; Bowring, op. cit., pp. 23 and 26.

⁶ See Clot-Bey, op. cit., vol. ii, p. 186; Bowring, op. cit., p. 20.

⁷ See Clot-Bey, op. cit., vol. ii, pp. 182–3; Kramers, op. cit., p. 946. Details are given in Dodwell, op. cit., p. 32. In A.D. 1808 Mehmed 'Ali investigated the *multazims'* titles and records, and then annulled all irregular grants and expropriated (on pensions) all *multazims* who were in arrears with their payments to the Treasury. The surviving *multazims* were expropriated in A.D. 1814 (see Jabarti, op. cit., vol. ix, p. 79).

⁸ See Jabarti, op. cit., vol. ix, p. 90.

⁹ Mehmed 'Ali 'succeeded in centralising the entire production in his own hands [by his monopoly system] and of [sic] disposing of it freely; the peasants were no more than day-labourers who were obliged to sell their products at fixed prices to the Government and to pay likewise their taxes in kind' (Kramers, op. cit., p. 947; cp. Clot-Bey, op. cit., vol. ii, pp. 182–3). The impact made by Mehmed 'Ali's monopoly system on the life of the Egyptian people reverberates through Jabarti's narrative. In A.D. 1812 Mehmed 'Ali monopolized the marketing of the entire cereal crop of Upper Egypt and the entire rice crop (*ibid.*, vol. viii, pp. 344 and 348); but the practice was not confined to the handling of agricultural produce. In the same year, the Pasha monopolized the marketing of imports, at the same time raising the prices (*ibid.*, vol. viii, p. 345), and established a hold over internal transport by building a river-fleet which he operated himself (*ibid.*, vol. viii, p. 345). He also monopolized slaughter-houses (*ibid.*, vol. viii, p. 351) and even forbade artisans to work for private employers (*ibid.*, vol. viii, p. 357). According to Jabarti the new monopolies were devised by Greeks and Armenians and were farmed out by the Pasha to them (*ibid.*, vol. viii, p. 355). In A.D. 1814 Mehmed 'Ali monopolized the transport of Ottoman pilgrims to the Islamic Holy Places in the Hijāz, and exacted his price from them (*ibid.*, vol. ix, p. 100). In A.D. 1816 he established a virtual monopoly over all shipping (*ibid.*, vol. ix, p. 197). The objective of these monopolies was, of course,

servile status to which they had been reduced was brought home to them by the conscription of their labour for public works.¹

It will be seen that, unlike Peter the Great, Mehmed 'Alī did not neglect the agricultural basis of his Western superstructure; but the measures which he took in his fundamental economic policy have to be credited—or debited—to the dictates of Egypt as well as to the promptings of Mehmed 'Alī's own genius. Peter's economic insight was certainly not inferior to his; and we may indeed surmise that Mehmed 'Alī, had he been Tsar of Muscovy, would have neglected agriculture as Peter did, and that Peter, had he been Viceroy of Egypt, would have fostered agriculture by the drastic but dubious methods of Mehmed 'Alī.

price-control with a view to price-raising. The state slaughter-houses sold their product to the butchers at fixed wholesale prices, and the butchers' retail prices were likewise fixed by the state (op. cit., vol. ix, p. 226). According to Jabarti (vol. ix, pp. 224 et seqq.) the imposition by the state of maximum retail prices without regard to seasonal variations in the relation between supply and demand, and even without regard to the levels of the state-imposed wholesale prices, proved paralysing for trade. In A.D. 1817 Mehmed 'Alī established a monopoly of hides at fixed prices (ibid., vol. ix, p. 252) and a monopoly of the operation of all looms. The raw materials of the textile industry were bought up by the Government and were distributed by it to the weavers, and the product was then sold by the Government at about three times the previous price (pp. 252-3). In A.D. 1820 Mehmed 'Alī monopolized soap (ibid., vol. ix, p. 317).

One of the objects of British policy in the negotiation of the Anglo-Ottoman commercial treaty of the 16th August, 1838, was to secure the abolition of monopolies in the Ottoman Empire with an eye to insisting on the application of this treaty provision to Ottoman territories under Mehmed 'Alī's administration. An escape-clause in previous Ottoman capitulations which had left the Ottoman Government a loophole for establishing monopolies at will was duly eliminated by the terms of the new treaty (Dodwell, op. cit., pp. 220-1; Bailey, F. E.: *British Policy and the Turkish Reform Movement, 1826-1853* (Cambridge, Mass. 1942, Harvard University Press), p. 125); but subsequent local negotiations between representatives of the British Government and Mehmed 'Alī ended in a compromise. It was agreed that Mehmed 'Alī should maintain his monopolies on condition of his selling the produce at public auction (Dodwell, op. cit., p. 222).

¹ Jabarti records that in A.D. 1817 peasants were conscripted to dig a new Alexandria canal (op. cit., vol. ix, p. 240). In A.D. 1819 they were conscripted again for canal digging, and this just before the maize harvest, so that it was no wonder that they had to be secured with ropes round their necks (ibid., vol. ix, p. 299). In 1818, 4,000 young men were conscripted to work in government factories (ibid., vol. ix, p. 274).

JEWISH HISTORY AND THE MILLET IDEA

BY JAMES PARKES

THE conception of community evolved between the first and fourth centuries of the Christian Era by a Rabbinic Judaism fitted admirably into the millet idea; and, so long as the majority community was prepared to allow a Jewish community milletal autonomy, the essential minimum requirements of Rabbinic Judaism could be maintained in any country in the World. In tolerating a variety of legal and social systems within a larger whole, Medieval Christendom as well as Islam made a Jewish Millet an acceptable social organisation for Judaism, and in the Western Society the Jewish Millet outlived by centuries all its peers, surviving until the nineteenth-century emancipation.

It seems to me, however, necessary to recognize that the millet idea in East and West, while it made Jewish survival possible by its recognition of communal autonomy, yet contained elements which made it intolerable as a permanent social organization. In particular the idea of inequality seems to me to be inherent in it. Neither Islam nor Medieval Christendom recognized Jews as equals; and both tolerated Jewish autonomy because both had the power to circumscribe it at will in their own interests. In both East and West there was also the social factor, in the sense that the inferiority of status implicit in the milletal dispensation encouraged a contempt which was always there, even if under the surface. A great deal of rubbish is talked about the excellent situation of Jews under Islam before Zionism. Existence for all but a few rich merchants was unenviable in the ghettos and malās of the Islamic World for many centuries before Zionism as a political movement was born.

Emancipation, by its emphasis on Judaism as an individual ethic, and on Jews as citizens manifesting a personal difference only in the religious buildings which they attended (or did not attend) for worship one day a week, created just the situation described by you.¹ Gentile societies that could afford not to fear Jewish competition accepted Jews; Gentile societies that had a still unfulfilled ambition to breed a native Gentile 'bourgeoisie' of their own hated the Jews and were jealous of them. But either situation dealt only with that aspect of Jewish life which expressed itself in economic structures and adaptabilities; and both ignored the fact that the heart of Judaism and of Jewish communal life was left unsatisfied by an economic liberty supplemented by a right to go to synagogue on Saturday instead of going to church on Sunday. The core of Rabbinic Judaism, inherited from its interpretation of the Law and the Prophets of the Old Testament, was a belief in a community that would give scope for a social justice and a righteousness which were the divinely appointed objectives of Man's life in This World. The ideal had been narrowed, ossified, and even perverted by the conditions of millet life; but within the Millet it had at least a chance of survival.

¹ On pp. 285-8, above.—A.J.T.

After the dissolution of the Millet, Jews individually plunged, where free, with enthusiasm into all movements for social reform and humanitarianism in a nineteenth-century Western World; but in Eastern Europe, where most of the Jewish people lived, the local conditions ruled out the possibility of any such individual Jewish participation in a liberal Gentile life; and therefore here one of two things was bound to happen. Some East European Jews sought an outlet for their inner malaise in taking part in Gentile revolutionary movements, some in an attempt to find a new communal basis for Jewish life. When a recrudescence of Antisemitism in Western Europe inhibited, or prevented, individual Jews there from expressing themselves in Gentile national movements aiming at the achievement of greater social righteousness, Jews in Western Europe likewise began to be attracted to one of the two alternatives which had grown out of the Eastern European situation.

In both East and West a return to a milletal dispensation was ruled out. With all its merits a millet system is only possible either in a society that is at a much more developed stage than any society had yet reached at the time of writing, or else in a society in which there is no effective devolution of responsibility and authority from the central government to the local geographical administration—the city, the county, or what not. The Islamic Society's weakness in this respect had enabled the millet system to survive in Dār-al-Islām down to recent times, and had allowed minorities a certain liberty and vitality, but this only at the cost of their having to live within a general framework of stagnation. It was inevitable that to many Jews the only alternative should seem to be the autonomy (or independence) of the national community (it is interesting that Austrian Jewish 'revolutionaries' for some time sought to cope with the nationality problem in Eastern Europe along the lines of 'personal nationality', which was an attempt to adapt the millet idea to contemporary European conditions).

Jews turned to Nationalism, not only because it was the contemporary vogue, but also because, with the failure of the idea of 'personal nationality', it was the only framework within which the unsatisfied longing for a medium in which to work for greater social righteousness could be satisfied. In other words, there were deeper Jewish roots for Jewish nationalism than you have allowed for.

It is also interesting to discover the way in which the emergence of a Jewish nationalism—which was, as you say, fantastic in terms of the non-existence of a territory where Jews cultivated the soil—followed a period of intense Jewish intellectual activity which had been devoted largely to the study of Jewish history, and not merely to the study of a Rabbinic Judaism which a Rabbinic orthodoxy had come to regard as the Jewish intellect's sole legitimate field. The flowering of a *Jüdische Wissenschaft* is an integral part of the picture of the emergence of a Modern Jewry; and this must also be regarded as being one of the outstanding events in the Jews' encounter with the Western Society, since it was the product of Jewish access to Western academic and intellectual life.

IX. B (ii) (a) 7, ANNEX

THE WELTANSCHAUUNG OF ALEXANDER HERZEN

ALEXANDER HERZEN (*vivebat* A.D. 1812-70) was the natural son of a Russian nobleman by a German mother. While still a student at the University of Moscow, he fell foul of the autocratic régime of Tsar Nicholas I. He left Russia in A.D. 1847 and spent the rest of his life in Western Europe in a society of Russian and Western liberal exiles. In taking this personal course, Herzen was opting for Westernization, and he accounted himself an opponent of his 'Slavophil' Russian contemporaries; yet in the same breath he proclaimed his affinity with them:

'Yes, we were their opponents, but very strange ones. We had the same love, but not the same way of loving, and, like Janus or the two-headed eagle, we looked in opposite directions, though the heart that beat within us was but one.'¹

The love which these nineteenth-century Russian 'Herodians' and Russian 'Zealots' shared was, of course, their love for Russia; but an even stronger bond between them was a hatred which they likewise shared for a middle-class outlook and way of life that had become dominant in the contemporary Western World. Herzen revolted as violently as the Slavophiles themselves against any suggestion that Russia might renounce her historic identity by abandoning herself to this Modern Western middle-class culture. This idea seemed outrageous to him because he believed no less fervently than the Slavophiles in Russia's destiny; and this belief that Russia had a destiny incompatible with conversion to the Modern Western middle-class way of life brought Herzen into line, not only with his Slavophil Russian contemporaries, but also with his Communist Russian successors. As an anti-bourgeois Russian aristocrat he became a Russian prophet of a socialism that was to be attained in Russia through revolution and was to lead to a sanguinary conflict between Russia and a Western World from which Russia—Slavophil or Socialist—was divided by a permanent and unbridgeable moral gulf.

These features in Herzen's outlook are brought out in his memoirs with a wealth of illustration of which only a few characteristic specimens can be cited here.

'The Western European is not in a normal condition; he is moulting. . . . The historical process has left in the foreground the slimy stratum of the petty-bourgeois, under which the fossilised aristocratic classes are buried and the rising masses submerged.'² . . . The petty-bourgeois were not produced by the Revolution. . . . Set free, they passed over the dead bodies of those who had freed them, and established their own régime.'³

¹ This passage from Herzen's periodical *The Bell*, p. 90, is quoted in Herzen, A.: *My Past and Thoughts*, English translation by Garnett, C. (London 1924-7, Chatto and Windus, 6 vols.), vol. ii, pp. 254 and 302. The quotations from Mrs. Garnett's translation have been made with the permission of the publishers.

² Herzen, *op. cit.*, vol. ii, pp. 228-9.

³ *Ibid.*, vol. iii, p. 134; *cp.* p. 147.

... Parliamentary government ... is simply the wheel in a squirrel's cage, and the most colossal one in the World.¹ ... Under the influence of petty-bourgeoisie, everything is changed in Europe. Chivalrous honour is replaced by the honesty of the book-keeper, elegant manners by propriety, courtesy by stiff decorum, pride by a readiness to take offence, parks by kitchen gardens, palaces by hotels open to *all* (that is, all who have money).² ... Bourgeoisie is the final form of Western European Civilisation, its coming of age. ... This closes the long series of its visions. ... By hard work the nations of the West have won their winter quarters. Let others show their mettle.'³

How infinitely remote from all this is the Russian spirit!

'Petty Bourgeoisdom is incompatible with the Russian character—and thank God for it.⁴ ... There is ... something irrational in our lives, but there is nothing vulgar, nothing stagnant, nothing bourgeois. ... You are restrained by scruples, you are held back by second thoughts. We have neither second thoughts nor scruples; all we lack is strength ... We have no law but our nature, our national character.'⁵

Russia's character is her destiny, and a nineteenth-century Herzen is as sure of this destiny as a sixteenth-century Philotheus.⁶

'Are we not perhaps satisfied with vestibules because our history is still knocking at the gate?' ... In our attitude to the Europeans ... there are points of resemblance to the attitude of the Germans to the Romans. In spite of our exterior, we are still barbarians.⁸ ... We have nowhere those hard-and-fast prejudices which, like a paralysis, deprive the Western European of the use of half his limbs.⁹ ... [The Polish émigrés] had a rich past; we had a great hope. Their breast was covered with scars, while we were toughening our muscles to receive them. Beside them, we were like recruits beside veterans. The Poles are mystics; we are realists.¹⁰ ... Have we not ... the right to look upon Russia as ... the centre towards which the Slav World, in its striving toward unity, is gravitating?¹¹ ... Do you not think it would be as well to become more closely acquainted with this inconvenient neighbour who makes himself felt throughout the whole of Europe, in one place with bayonets, in another with spies?'¹²

The next manifestation of Russia's puissant non-Western destiny will be an anti-bourgeois revolution.

'The free and rational development of Russian national existence is at one with the ideas of Western Socialism.'¹³ ... The Russian enjoys a terrible advantage over the European; he has no traditions, no habits, nothing akin to him to lose. The man who has no wealth of his own or of others goes most safely along dangerous paths.¹⁴ ... The Russian imperial autocracy ... is a military and civil dictatorship with far more resemblance to the Caesarism of Rome than to a feudal monarchy. A dictatorship ... cannot be permanent.¹⁵ ... Who will be the predestined saviour? ... Whoever it may be, it is our task to meet him with warm welcome.'¹⁶

¹⁶ *Ibid.*, vol. vi, p. 92.

¹⁷ *Ibid.*, vol. vi, p. 211.

Herzen's exultation over his vision of Russia's revolutionary future is seldom chilled by the cold touch of doubt.

'We perhaps ask for too much and shall get nothing. That may be so, but yet we do not despair.'¹

He seems naïvely blind to the trenchancy of Western comments on the Russian *éthos*, which he records *en passant*. 'You Russians are either the most absolute slaves of your Tsar or . . . anarchists, and it follows from that that it will be a long time before you are free', the conservative and monarchist-minded Duc de Noailles once remarked to Herzen.² 'I tell you what, gentlemen: Hard as it may be for us with the Russian Government, anyway our position under it is better than what these socialist fanatics are preparing for us', declared the Polish émigré Demontowicz after prolonged arguments with the Russian émigré Bakunin.³

Herzen is not dismayed by the prospect, which he foresees, of a head-on collision between a revolutionary Russia and a conservative West.

'Our classic ignorance of the Western European will be productive of a good deal of harm; race hatreds and bloody collisions will develop from it later on.'⁴ . . . Much hatred yet will be engendered and much blood yet will flow through this difference in the two stages of growth and education⁵ . . . from "the conflict of these two different forms of culture".⁶

SICILIAN LIGHT ON ROMAN ORIGINS

IN rejecting as a professional pedigree-maker's fake the story, immortalized by Virgil, that the ancestors of the Romans were refugees from a foundering Minoan World who had been cast up on the coast of Italy by the same tornado that stranded the Philistines on the coast of Syria, we need not rule out the possibility that the Romans may in fact have been descended from immigrants of a later date.

This possibility is suggested by a consideration of the linguistic map of Italy in the period between the establishment of the Greek and Etruscan settlements on Italian ground and the subsequent Latinization of the Peninsula as a result of a Roman conquest. In the intervening age, languages of the Latin type were spoken by three peoples: the Sikel natives of Sicily,¹ the Ligurians in the North-Western Appennines and the Maritime Alps,² and the Latins and Falisci in the lower basin of the River Tiber. The rest of the Italian Peninsula, apart from the Greek and Etruscan settlements, was occupied in that age by peoples speaking other languages who would appear to have spilled over into Italy from the north-east in three successive waves. A wave of Umbrian-speakers had reached the west coast both north and south of Latium; for Umbrian dialects were spoken by the untamed Volscians ('marshmen') in the Pomptine swamps, as well as by the natives of an Etruria where, under an alien ascendancy, the largest river in the land testified to the nationality of the subject population by continuing to bear the name Umbro (Ombrone). Behind the Umbrian-speakers stood the Oscan-speakers, and behind these the Illyrian-speaking peoples of Venetia, Apulia, and Northern Calabria.

The general configuration of this linguistic map suggests that the speakers of languages of the Latin type in this age were survivors of an earlier wave of immigrants into Italy who had been pushed out south-westward into Sicily beyond the Straits of Messina and north-westward into a Ligurian highland fastness by three waves following in their wake; but this interpretation still leaves to be explained the presence of a Latin-speaking population in the open country of Latium. How are we to account for this Latin enclave in an elsewhere Umbrian and Oscan

¹ The fragmentary surviving relics of the Sikel language have been presented and discussed by R. S. Conway in *The Cambridge Ancient History*, vol. iv (Cambridge 1926, University Press), pp. 436-7; by J. Whatmough in *The Foundations of Roman Italy* (London 1937, Methuen), pp. 365-6; and by T. J. Dunbabin in *The Western Greeks* (Oxford 1948, Clarendon Press), pp. 189-90. As it appears to the writer of this Study, the evidence proves conclusively that the Sicels' mother tongue was virtually identical with Latin, and that it can be classed at any rate as a language belonging to the same sub-group as Latin within an Italic family in which the other two sub-groups were the Oscan and the Umbrian.

² The relics of the Ligurian language have been presented and discussed by Conway in loc. cit., pp. 433-5, and by Whatmough in op. cit., pp. 129-30. Whatmough agrees with Conway that Ligurian is an Indo-European language of Sikel affinities, and, *pace* Whatmough's judgement that it is not a member of either the Italic or the Celtic family, the present writer ventures the opinion that Ligurian, as well as Sikel, will turn out to be an Italic language of the Latin sub-group.

Central Italy, just beyond the south-eastern limits of the Umbrian territory that had been occupied by the Etruscans? We may find a clue to the puzzle if we turn our eyes for a moment to a point just beyond the opposite extremity of Etruria, along the coast to the north-west of the mouth of the River Arno.

Here, at the eastern end of the Italian Riviera, we find four place-names—not of Roman mintage, and therefore presumably ante-dating the Roman conquest—that are identical with the principal place-names in the Elymian country in the north-western corner of Sicily. The Gulf of Spezia is flanked by a Port of Eryx (the latter-day Lerici), bearing the name of the celebrated Sicilian mountain, and by a Portus Veneris, dedicated to the same goddess as the celebrated temple of Aphrodite on the Sicilian mountain's flank. Again, about half-way between the Gulf of Spezia and Genoa, the mouth of the River Labonia (Lavagna) is flanked on one side by a Segesta (the latter-day Sestri Levante) and on the other by an Entella (still commemorated in the name of a local stream). This fourfold correspondence between place-names in Sicily and on the Riviera can hardly be accidental; we cannot reject the inference that the places known by these four names in Liguria had been called after the four places with identical names in Sicily, or vice versa; and the probability that the group of names in Liguria was derived from the group in Sicily is indicated by the fact that in Liguria, as in Sicily, the mountain-name appears in the Graecized form 'Eryx' and not in a Ligurian equivalent of the Latin form 'verruca' ('peak'), which we should expect to find surviving here if the name had originated in Liguria and had been carried thence to Sicily.

The reappearance of these four Sicilian names on the Riviera thus indicates that the Sicilian Elymi had planted settlements here at some date; and this date must be earlier than the Roman Age; for the Romans did not draw on their Graecized Sicilian subjects for the colonists whom they planted at Luna and other points in and around Liguria in and after the second century B.C. The hypothesis that most naturally suggests itself is that these Elymian settlements along the Eastern Riviera were part of the older colonizing movement that had created Magna Graecia and Etruria. We know that the Elymi were particularly receptive to Hellenic influences, besides being particularly hard pressed by the encroachments of Greek intruders on their territory. It might well have occurred to them to relieve the pressure of population in a shrunken homeland in Sicily by resorting to the Greek expedient that had borne so hard upon the Elymians themselves. Why should they not follow the Greeks' example by colonizing some stretch of West Mediterranean coastline where the natives were sufficiently backward to be easily subdued or expelled? If, at some stage in the colonizing movement that was in process from the eighth to the sixth century B.C., the Elymians did join in the game, an obvious field for them to choose would have been the Riviera between the north-western outposts of the Etruscans and the eastern outposts of the Massiliots. The Italian Riviera had a promising commercial hinterland in the upper basin of the River Po, and thus in their general location the four Elymian settlements were

well placed—though the Hannibalic War was eventually to demonstrate that, in overlooking the superlative advantages of Genoa, the Elymian prospectors had been no less blind than those Megarian Greek prospectors who passed by the vacant site of Byzantium in order to settle at Calchedon.¹

The Elymian settlers along the Eastern Riviera had, however, at any rate chosen a location where they could count on a 'natural frontier' to safeguard them against Etruscan encroachments; for, as late as the time of the Hannibalic War, the lower valley of the Arno was a pestilential swamp, which Hannibal's army found it almost as difficult to traverse as the Alps, and which cost their leader the loss of an eye. The Etruscans' Latin neighbours at the opposite extremity of the Maremma likewise enjoyed the benefit of a protective river-barrier which enabled the Romans to repulse the Etruscan war-lord Lars Porsenna's attempt to reconquer them after they had expelled their Etruscan tyrant Tarquin. On the analogy of the Elymian settlements along the Riviera, is it too rash a conjecture to guess that the cluster of Latin-speaking communities adjoining the lower course of the Tiber, which appear on the linguistic map of Italy in the period intervening between the colonization of Magna Graecia and Etruria and the Roman conquest, were not relics of an aboriginal deposit of peoples speaking languages of the Latin type, but were colonists from Sicily who had succeeded in thrusting themselves into a promising site in between the farthest south-eastern outpost of Etruria and the farthest north-western outpost of Magna Graecia?

A scrutiny of the map of Latium and the adjoining Faliscan country confirms the impression that this Tiberine enclave of Latin-speaking population was not, like the Volscians' marshes or the Hernicans' crags, a fastness in which a hard-pressed native people had managed to hold out against aggressive assailants, but was a 'bridgehead' established by invaders from overseas who had made a landing *vi et armis* on the beaches just south-east of Ostia. On this reconstruction of an unrecorded chapter of history, the Falisci would be a vanguard of the Sicel invaders who rashly pushed up the Tiber Valley and settled on its right bank, only to fall permanently under the domination of Etruscans on whose preserves they were trespassing. A more cautious Latin rear-guard would have confined its encroachments within an area covered by a number of natural frontiers: the river-line constituted by the courses of the Lower Tiber and its tributary the Anio, the south-western spurs of the Sabine Mountains, and the natural system of fortifications provided by the rampart-like slopes of the craters-within-craters known as the Alban Hills. The fortresses built by the Latin interlopers to protect this perimeter would have been Rome, Tibur, Praeneste, and Alba Longa.

On this showing, there would be a sense in which Rome had been 'an Hellenic city'² already before the first stone of her material structure had been laid, since it would have been an Hellenic example that had inspired her Sicel founders to join in a colonizing movement that in the eighth, seventh, and sixth centuries B.C. was planting the west coast of

¹ See II. ii. 43-48.

² See V. v. 212, n. 3.

Italy, from a Chalcidian Rhegium on the Straits of Messina to an Elymian Entella on the Riviera, with sea-borne settlers of Greek, Etruscan and Sicilian origin.

This inference from a linguistic map has some support in the Roman literary tradition, for Siculi or Sicani are located in Latium by both Virgil and Pliny. Siculi are named by Pliny in a list of early peoples of Latium,¹ and Sicani in a list of 'carnem in Monte Albano soliti accipere populi Albenses.'² Sicani are thrice enumerated by Virgil among the peoples already established in Latium before the advent of Aeneas.³ In the first and the third of these passages of the *Aeneid*, these Latian Sicani are associated with the Rutuli and the Aurunci, and in the third passage these three peoples are described as being one another's neighbours.

This Virgilian tradition of a Sican element in the population of Latium is, of course, quite independent of the tale of a Trojan invasion of Latium which is the main theme of the *Aeneid*. Indeed, Virgil makes his Latian Sicans join with the other old inhabitants of Latium in attempting to resist the Trojan intruders. While continuing to reject the tale of a Trojan settlement in Latium as fictitious, we may perhaps accept the tradition of a Sican settlement in Latium with the amendment that these Latian Sicans were colonists from Sicily who had not settled in Latium before the eighth century B.C. at the earliest.

IX. C (i), ANNEX
'ASIA' AND 'EUROPE': FACTS AND
FANTASIES

IN the introduction to his history of a concatenation of encounters culminating in a collision between the Achaemenian Empire and the Hellenic World,¹ Herodotus professes to reproduce a Persian exposition of the motive that had impelled the Achaemenidae to take the offensive against the Hellenes, and of a theory of history which was the ground of the Persians' Hellenophobia according to this story. The alleged motive is one of the characteristic points of honour in the barbarian *Weltanschauung* of the Heroic Age. The Persians, according to Herodotus, believed that they had inherited a blood feud in which the latest entry in the running account was a still unavenged injury, suffered by predecessors of theirs, which it was their moral duty to requite. The alleged theory in virtue of which the Persians are represented by Herodotus as believing themselves to be saddled with this obligation is as sophisticated as the blood-feud *motif* is primitive. The Persians, according to Herodotus, felt it incumbent on themselves to exact vengeance from the Hellenes for the siege and sack of Troy because, on the Persian theory of history, the Persians' own encounter with the Hellenes, the Trojans' encounter with them, and the Colchians' and the Phoenicians' encounters with them before that, were so many incidents in an historic feud between Asia and Europe. The hypothetical continuity of the feud would make these incidents historically continuous with one another and so create a moral solidarity between successive representatives of Asia in this quarrel of the continents.

The wrong inflicted on Asia which the Persians are declared by Herodotus to have felt it to be their duty to avenge was the Hellenes' wanton offence of retaliating for the abduction of a princess by waging a war of annihilation and thereby opening a new and unprecedentedly devastating chapter in the feud between Europe and Asia.²

'Up to this point the injuries that they had inflicted on one another had been confined to abductions, but at this juncture the Hellenes put themselves monstrously in the wrong. They committed an unprovoked act of military aggression against Asia when the Asiatics were still innocent of any such outrage against Europe. . . . The Persians claim that "they" (identifying themselves with the Asiatics) had let the abductions pass without taking any notice, whereas the Hellenes had exacted vengeance for the abduction of a Lacedaemonian princess by collecting a great expeditionary force and then invading Asia and destroying Priam's empire. From that date, the Persians say, "they" had always regarded the Hellenic World as being in a state of war with "them"—the point being that the Persians lay claim to Asia and to the non-Hellenic Asiatic peoples as their own domain, while they think of Europe and the Hellenic World as being an *alter orbis*. This is the Persians' version of the course of

¹ This Herodotean concatenation of encounters has been discussed on pp. 454-60, above.

² The 'chain-reactions' that 'in real life' are apt to be set in motion by such wanton acts of *hybris* have been discussed on pp. 454-63, above.

historical events: they see in the sack of Troy the origin of their own quarrel with the Hellenes.¹

If any of Herodotus's Persian contemporaries had ever taken Hellenic life and letters seriously enough to think of reading this Asiatic Greek historian's introduction to his story of an oecumenical concatenation of encounters, the Persian explorer of an alien Hellenic mental world would assuredly have been taken aback at finding his countrymen credited with the motive and the theory that Herodotus has here attributed to them. The authentic motive behind the Persians' unsuccessful attempt, between 492 and 479 B.C., to conquer the then still independent residue of the Hellenic World was certainly not to avenge legendary wrongs supposedly inflicted on Trojan victims by Achaean aggressors. The number of Persians who had heard of 'the Trojan War' cannot have exceeded the number who were familiar with the epic poetry of their Asiatic Greek subjects,² and a Persian who knew Homer must indeed have

¹ Herodotus, Book I, chaps. 4-5. Caricature is perhaps the best comment on this Herodotean reconstruction of the historical antecedents of the encounter between the Achaemenidae and the Hellenes. Let us imagine that, at a date still in the future at the time of writing, Continental Western Europe has been militarily overrun and politically subjugated by the Soviet Union and that Herodotus has returned to life to write the history of a consequent conflict between the Soviet Union and the United States. We can imagine him transposing this episode in an encounter between the Western and the Russian civilizations into terms of a 'war of the worlds' in which the Old World and the New World are the perennial parties to an inter-mundane feud.

'The Castilians', Herodotus might have written, 'were the authors of the original crime out of which this feud between the New World and the Old World arose. After wantonly drawing upon themselves the Envy of the Gods by venturing to make their way across an Ocean which no man-made ship had ever previously traversed, they proceeded to provoke the Godhead further in another way by attacking and overthrowing the empires of the Aztecs and the Incas, when these legitimate sovereigns of the New World had never thought of committing aggression against the Old World on their part. The wrong thus inflicted on the New World by Castilian hands was avenged by the colonists planted there by the Castilians themselves and by the English, who rebelled against their mother countries, and thereby put an end to the Old World's dominion over the New World, in retaliation for the arbitrary action of a King of England named George III in imposing a tax in his American dominions on the importation of an old-world herb called tea, from which the colonists had learnt to brew a drink to take the place of wine. This re-establishment of American independence would have balanced the account between the two worlds if the equilibrium had not been upset again by the intervention of the United States in the World War of A.D. 1914-18. The Americans defend this intervention by arguing that they were acting in self-defence, on the ground that, if they had allowed the Germans to win that war, then the Germans, who are notoriously deficient in a sense of moderation, would never have been content with having made themselves masters of the Old World but would have proceeded to mobilize all the Old World's resources for an attack upon the New World in which the United States would assuredly have lost her liberty. The Russians, on the other hand, argue that, in intervening in the affairs of the Old World, the United States was committing an act of aggression and that, since the overthrow of Germany in the Second World War, the duty of championing the cause of the Old World has fallen on Russia's shoulders. On this ground they maintain that their own recent occupation of the countries along the Atlantic seaboard of the Old World, facing the United States, was not an act of aggression on Russia's part but was a necessary measure of precaution, taken in the occupied countries' own interests, to forestall a further act of aggression against the Old World which was to be expected from a United States which had committed two such crimes already. This, then, was the origin of the Great Russo-American War, in which all the forces of the Old World and the New World were arrayed against one another.'

² It is perhaps worth noting that the Herodotean interpretation of 'the Trojan War' as an episode in a feud between 'Europe' and 'Asia' has no warrant in the Homeric Epic. The authors of the two catalogues of the opposing forces (*Iliad*, Book II, ll. 484-759 and ll. 811-77) describe an Achaean confederacy astride the Aegean making war on a Trojan coalition astride the Dardanelles; and, whatever the relation between these passages and other parts of the poem may be held to be, there is at any rate no inconsistency between them on this particular point of political geography.

been a *rara avis*. In another context¹ we have already observed that the authentic motive for Darius's forward policy was, not any romantic impulse to pursue an imaginary feud, but the prosaic need to find a tenable north-west frontier for the Achaemenian Empire in lieu of an existing line which had been proved to be untenable by the painfully cogent experience of the Asiatic Greek and Carian revolt of 499-494 B.C. And, as for the theory of a perennial feud between 'Asia' and 'Europe', there is no serious evidence that the Persians of the Achaemenian Age ever applied to such mundane matters as Geography, History, and Civilization a capacity for thinking in abstract general terms which they displayed in the transcendental sphere of a Zoroastrian theology that concerned itself, not with a merely terrestrial Habitable World, but with the Universe, and that made its grand dichotomy, not between Asia and Europe or between Orientalism and Hellenism, but between Light and Darkness and between Good and Evil.

The motive and the theory that Herodotus attributes to the Persians were both manifestly invented by some Hellenic mind. The Hellenic inventor was not Herodotus himself, for Asia is already a current synonym for the Achaemenian Empire in Aeschylus's *Persae*,² which was produced for the first time in 472 B.C., and the same antithesis between Asia and Europe reappears in Hellenic medical works of the Hippocratean school which were probably written in Herodotus's own generation. Nor does Herodotus himself explicitly endorse an interpretation of history which he has borrowed from Hellenic predecessors without acknowledgement and has attributed to Persian contemporaries without permission. Yet, in effect, 'the Feud between Europe and Asia' is the dominant and unifying theme of Herodotus's work, and the masterliness of his workmanship is largely responsible for the subsequent vogue of this fifth-century Hellenic fantasy of a 'quarrel of the continents'.

This fantasy had been begotten when some imaginative Hellenic mind had given a revolutionary change of meaning to the two traditional Hellenic geographical names 'Europe' and 'Asia' by transferring them from the mariner's chart to the publicist's political map and to the sociologist's diagram of the habitats of cultures. This feat of imagination had been unluckily inspired; for, though Herodotus was to turn it to such good literary account, it was, all the same, a fantasy that had turned sense into nonsense. The mariner's navigational distinction between 'Asia' and 'Europe', as far as it went, could have had as long a life as the physical geography of the Quaternary Age of the planet's geological history, whereas a constellation of political forces in which the waterway between 'Asia' and 'Europe' coincided with a political frontier had never arisen, from the dawn of recorded human history down to the time of writing of the present work, except during the two brief periods 547-513 B.C.³ and 386-334 B.C., when this waterway constituted the north-west frontier of the Achaemenian Empire.⁴ As for the identifica-

³ See p. 434, above.

⁴ It is true that the frontier of the Lydian Empire had gradually approximated towards his water-line in the course of the century preceding Cyrus's conquest of Lydia in

tion of the mariner's 'continents' with the domains of diverse cultures, this was, if possible, even more fantastic than the political misapplication of these nautical terms; for the historian cannot lay his finger on any period at all, however brief, in which there was any significant cultural diversity between 'Asiatic' and 'European' occupants of the all but contiguous opposite banks of a tenuous inland waterway which would have continued to be the fresh-water river that it originally had been if Poseidon had not high-handedly enlarged his own domain by a mighty trident-stroke that had brought the salt water flooding in, up the rift which the god had cleft, from the mouth of the Aegean to the head of the Sea of Azov.¹

Whatever the ultimate origins of the names 'Asia' and 'Europe' may have been,² their usage as a pair of antithetical but mutually complementary physiographical expressions must have been first brought into currency by navigators of the Aegean who had succeeded in mastering the challenge of 'the estranging sea'³ and who had consequently become disagreeably aware of limitations set by *terra firma* to their freedom of movement in an element which they had now made their own.

It is the mariner's nomenclature that first draws the distinction between his friends the islands, which offer him ports of call and harbours of refuge, and his enemies the 'continents' whose continuous coastline disappointingly bars his passage, as gulf after gulf which promises to be a strait turns out to be a cul-de-sac. The Hellenic mariner who had inherited a mastery of the Aegean from Minoan predecessors could not fail to note and name the two continents that proved to set an eastern and a western bound to his sea-faring. Feeling his way northwards along the Asiatic and the European coast of the mainland, he summoned up the courage to hazard the passage of three successive straits—the

547 B.C.; but even Croesus, the last and widest-ruling of the Kings of Lydia, had never succeeded in extending his dominions up to the continental Asiatic water-front all along the line. Miletus, the leading Continental Asiatic Greek city of the day, as well as the non-Greek-speaking Hellenic country Lycia, had successfully maintained their independence until, after the fall of Sardis, they had been compelled to submit to Lydia's Persian conquerors.

¹ See I. i. 326, n. 2.

² The Aegean mariner's term 'Asia' to denote the continent which set the eastward limit to his freedom of movement in his own element appeared to have been derived from the local name for a marsh or watermead in the valley of the River Cayster, presumably somewhere not far from its mouth (*Iliad*, Book II, l. 461); and the documents retrieved by Western archaeologists from the wreck of the Hittite imperial archives at Boghaz-qa'eh indicated that this Asian mead was called after the thirteenth-century West Anatolian principality Aššuwā. The etymology of the name 'Europe' was obscure. It might be a Greek travesty of the Phoenician word *'ereb* (corresponding to the Arabic *gharb*) meaning the dark quarter where the Sun sets in the West; or, if it was not a technical term borrowed by Greek mariners from their Phoenician confrères, but was a native Greek word, it might signify the 'broad faced' *terra firma* which had proved itself to be a 'continent' by stretching away continuously without a break through which a ship could thread its passage, in contrast to the islands of the Archipelago round whose circumscribed coasts the Aegean mariner had learnt readily to find his way. This literal interpretation of the word is perhaps too rational to be convincing, and another possibility is that the Continent of Europe may have derived its name from a goddess who was 'broad-faced' because she was bovine. 'The Tyrian princess Europa' (Herodotus, Book I, chap. 2) who had been abducted, according to the Hellenic myth, by Zeus in the guise of a bull seems likely to have been a goddess in the guise of a cow, and we may identify her, according to our fancy, with 'the cow-faced Hera' or with the goddess incarnate in a heifer whom the Hellenes knew as Io and the Egyptians as Hathor.

³ The genesis of the Minoan Civilization has been traced back to a victorious response to this physical challenge in I. i. 323-30.

Dardanelles, the Bosphorus, and the Straits of Kerch—where Asia and Europe all but clasped hands and threatened to crush between their fingers the audacious ship that ventured to run the gauntlet. For each of these daring transits the adventurous Hellenic mariners of the eighth and seventh centuries B.C. were rewarded by finding their way into a new Aegean in the shape of another inland sea; but, when they had thus successively won their way from the Aegean into the Marmara, from the Marmara into the Black Sea, and from the Black Sea into the Sea of Azov, and had ascended the River Don to the head of fluvial navigation, they there at last came to a point where their own element finally failed them and where the opposing continents, which had so far thrice alternately converged and receded, at length lost their separate identities by melting into one.

Even on the plane of physical geography, the mariner's distinction between 'Europe' and 'Asia' made sense only so far as the physical effect of Poseidon's trident-stroke extended. The distinction could neither have been invented nor even have been understood by a Nomad who in his own peculiar element could range at will over a steppe which afforded him passage without any appreciable break—when once he had made his discovery of the waterless Dardanelles called the Zungarian Gap—all the way between the eastern slopes of the Carpathians and the western slopes of the Khyngan Range. The distinction drawn between an Asiatic and a European continent in an Hellenic nautical nomenclature would have been equally unintelligible to the Eurasian Nomad's northern neighbour and adversary the Eurasian peasant, whose element was the belt of Black Earth extending from the eastern slopes of the Carpathians to the western slopes of Altai. The sedentary cultivator of the soil would have agreed with the nomadic herdsman in dismissing, as the ineptitude that it was, an arbitrary division of his realm between two continents invented in another region of the globe by alien seamen for navigational purposes; and an Herodotean 'quarrel of the continents' would have been brushed aside, as a meaningless irrelevancy, by a pair of landmen who were both intent on Cain's and Abel's historic conflict between 'the Desert' and 'the Sown'.¹

The boundary between the Hellenic mariners' continents of Asia and Europe was a navigable waterway, and this continuous channel of salt water which carried their ships from the Aegean through the Dardanelles and the Marmara and the Bosphorus and the Black Sea and the Straits of Kerch came to an end at the head of the Sea of Azov. This last link in a chain of inland seas still served to demarcate an Asia and a Europe from one another;² but beyond that point the Hellenic geographers never succeeded in laying their finger on any inland feature in the physical landscape that could offer any convincing line for partitioning an indivisible Eurasia which no Poseidonian trident-stroke had here cleft asunder; and this problem of drawing a land-frontier between Asia and Europe proved equally baffling to Modern Western geo-

¹ See III. iii. 7-22.

² The Sea of Azov was the boundary between Asia and Europe according to Hippocrates, *Influences of Atmosphere, Water, and Situation*, chap. 13.

graphers who had saddled themselves with this Hellenic intellectual incubus as one of the penalties of profiting by a Modern Western Renaissance of the corpus of Hellenic culture.¹

It was in vain that these Hellenomane Western geographers shifted an imaginary boundary eastward from the line of the Don to the lines of the Volga and the Caucasus, and subsequently followed the Russian Empire's military advance into Transcaucasia in order to find a boundary between the continents of Europe and Asia in Russia's fluctuating political frontiers *vis-à-vis* Turkey and Persia.² Even this desperate expedient of equating the bounds of a continent with transitory political frontiers was of no avail to the perplexed geographers in the formidably broad torso of Eurasia between the north shore of the Caspian and the south shore of the Arctic Ocean; for on this front the political frontier of Russia had long since rolled on eastward up to the shores of the Pacific Ocean, and to have stretched the Continent of Europe, in Russia's train, to extend as far as Okhotsk and Vladivostok would merely have multiplied the geographers' embarrassments. They were reduced to dissecting the living body politic of Russia into an imaginary 'Russia-in-Europe' and 'Russia-in-Asia' along the unconvincing line of the Ural River and the Ural Mountains, and garnishing their fictitious 'Russia-in-Asia' with a non-existent political capital at Irkutsk for the edification of school-children who would feel their geographical education incomplete if they could not name a capital for every so-called state on the list that they were given to learn by heart. Thereafter the geographers belatedly discovered that the Ural Mountains which they had made into a household word were no more noticeable a feature in the physical landscape than the Chiltern Hills,³ and that this vaunted physical barrier between Europe and Asia was not strongly enough pronounced even to serve as a boundary between one local province of the Russian Empire and another.⁴

The geographers' dissection of Eurasia into a 'Russia-in-Europe' and a 'Russia-in-Asia' was almost surpassed in fatuity by their dissection of the Ottoman Empire into a 'Turkey-in-Europe (capital: Constantinople)' and a 'Turkey-in-Asia (capital: Smyrna)'; and they could not save their reputation by pointing out that 'European' and 'Asiatic' Turkey, unlike 'European' and 'Asiatic' Russia, were physically demarcated from one another by Poseidon's salt-water-filled rift.⁵ The geographers' error here lay in attempting to translate a serviceable piece of navigational nomenclature into political and cultural terms. In the daily life of Hellenes whose element was the sea, the salt water was a bond between continents

¹ This is acknowledged by Oskar Halecki in *The Limits and Divisions of European History* (London 1950, Sheed and Ward), p. 85.

² On this political principle of demarcating continents, the Transcaucasian districts Qars, Ardahan, and Batum 'changed continents' twice within forty years—from Asia to Europe in A.D. 1878 and back again from Europe to Asia in A.D. 1918.

³ On the 23rd January, 1930, the writer of this Study traversed the Urals *en route* across Eurasia from Vladivostok to Ostend via Sverdlovsk (Yekaterinburg), and found them as unobtrusive as the Chilterns on the road from London to Oxford via High Wycombe.

⁴ This is acknowledged by Halecki, *op. cit.*, p. 86.

⁵ Halecki, in *op. cit.*, pp. 75-76, acknowledges that the Straits do not sunder Europe from Asia Minor.

which were barriers to intercourse by navigation; and in the daily life of latter-day inhabitants of Constantinople the Bosphorus was the central thoroughfare of a city bestriding it. The twentieth-century Turkish business man who worked every day in Pera and slept every night in Scutari would have been astonished to hear that the *thalweg* of the familiar metropolitan waterway which he crossed in a penny steamer twice a day on the way to and fro between his dormitory and his office marked the boundary between two of the major divisions of the land-surface of the globe, and that this thread of 'salt estranging sea' was so potent an insulator that Scutari, Haydar Pasha, and the other 'Asiatic' quarters of the Bosphoran imperial city had a closer affinity with Calcutta and Peking than they had with Pera and Istanbul, while conversely Istanbul and Pera had a closer affinity with a 'European' Paris and Madrid than they had with Haydar Pasha and Scutari.

No citizen of Constantinople could ever have been persuaded to swallow such nonsense; for the Republic of Turkey which bestrode the narrow seas between Asia and Europe at the time of writing was only the latest of a series of states with the same geographical configuration. In the political geography of the Ottoman Empire, the East Roman Empire, the Roman Empire itself since the age of Diocletian and Constantine, and the abortive empire of Alexander the Great's local successor Lysimachus, the waterway between the Aegean and the Black Sea had proved itself to be the body politic's spinal cord by attracting the site of the seat of government to its shores. Lysimachus had laid out a capital on the Dardanelles, in the neck of the Gallipoli Peninsula, for an empire which he had momentarily extended to the Danube in one direction and to the Taurus in the other. The capital of the Roman Empire had gravitated from the banks of the Tiber to the shores of the Marmara,¹ and Diocletian had governed the Hellenic World from Nicomedia (Ismid)² before Constantine had converted Byzantium into the Second Rome which an East Roman Empire and an Ottoman Empire successively adopted as their capital.

When the East Roman Imperial Government at Constantinople was overthrown by Western Christian adventurers in A.D. 1204, the Greek Orthodox Christian resistance movement which immediately declared itself at half a dozen places in the provinces found its most effective base of operations at Nicaea, a provincial city which combined the political advantage of proximity to the East Roman Empire's central waterway with the military advantage of being fortified by Nature as well as by art. Nicaea, like the landward face of Istanbul, was encased in a triple line of fortifications; a ring of mountains encircled the inland basin in which the city lay; and the western half of this basin was filled by a lake which drained through a defile into the Gulf of Cius (Gemlik) and thence into the Sea of Marmara. The Greek Orthodox Christian principality which was established at Nicaea in A.D. 1204 by the refugee patriot Theodore Lascaris gave a practical demonstration of the working of local laws of political geography which was not lost upon the 'Osmanlis' when, 122 years later, these Turkish Muslim empire-builders gained

¹ See VI. vii. 219-20.

² See VI. vii. 217-18.

possession of a neighbouring and comparable site at Brusa.¹ The princes of Nicaea demonstrated between A.D. 1204 and A.D. 1261 that a provisional capital within a stone's throw of the Asiatic shore of the Marmara afforded a practicable base of operations for a conquest of Thrace and Macedonia which could then be rounded off by the capture of a straits-besriding empire's inevitable ultimate capital at Constantinople.

Nicaea and Brusa successively fulfilled their destinies by reinstating Constantinople as the capital of an empire which these two temporary queens of the narrow seas had built up for the benefit of their still more auspiciously situated sister on the Bosphorus; but a twentieth-century Republic of Turkey, whose capital was not Constantinople but Ankara, had other predecessors which, like itself and unlike the Ottoman and Palaeologan empires, had bestridden the narrow seas without planting the seat of government on their shores. The Dardanelles were thus bestridden first by the Seleucid and then by the Pergamene successor-state of the abortive empire of Lysimachus. Though both these Hellenic empires, like the latter-day Republic of Turkey that emerged from the wreckage of the Ottoman Empire after the World War of A.D. 1914-18 and like their own predecessor the Achaemenian Empire, were land-powers centred on Asiatic ground and not sea-powers centred on the Straits, the water-boundary between the continents of Asia and Europe was too slight a barrier to provide them with 'a natural frontier'; and they both found it advisable, for the defence of their Asiatic dominions, to hold a European bridgehead across the water.

The salt-water boundary between the mariner's continents Asia and Europe was as insignificant a feature on the cultural, ecclesiastical, and ethnographical maps as it was on the political map.

The Aegean Sea was bestridden by the Hellenic World and by the main body of the Orthodox Christian World since the first emergence of each of these two societies, and by the Iranic Muslim World since the Ottoman conquest of Rumelia in the fourteenth century of the Christian Era. In the internal structure of the sea-faring Hellenic Society in its pre-Alexandrine Age, the waters of the Aegean proved themselves to be, not a barrier, but a bond by knitting together an Asiatic and a European half of an indivisible Hellas as a European and an American half of an indivisible Western World were knit together by the conductive waters of the Atlantic in the ocean-faring age of Western history; and, when we turn to the ecclesiastical map, we find that the water-boundary between Asia and Europe was crossed by religious missionaries as readily as by military conquerors.

In his two days' voyage from Troas to Neapolis,² Saint Paul, as we have seen,³ was following in the wake of Seleucus Nicator and of Darius the Great's lieutenant Mardonius; and, some thirteen hundred years later, Islam, in its turn, was propagated from Asia to Europe with equal facility by Ottoman disciples of the Prophet Muhammad who pursued

¹ The Lascarids' role as path-finders for the 'Osmanlis has been noticed already in III. iii. 27.

² Acts xvi. 11.

³ In VI. vii. 95-97.

the missionary's aim by the conqueror's methods. In the history of the Eastern Orthodox Church the distinction between 'Europe' and 'Asia' was not merely meaningless but was positively misleading. A division of the World's land-surface into continents was inapplicable to the ecclesiastical geography of a commonwealth of churches whose two oldest members were an 'Asiatic' Patriarchate of Antioch and an 'African' Patriarchate of Alexandria, and whose senior member was an Oecumenical Patriarchate of Constantinople in which 'Asiatic' and 'European' sees were indissolubly associated with one another, while the largest and most powerful member of the group at the time of writing was a Patriarchate of Moscow whose ecclesiastical subjects were scattered over the face of an indivisible Eurasia from the shores of the Baltic Sea at Leningrad to the shores of the Pacific Ocean at Vladivostok.

The linguistic map tells the same tale as the ecclesiastical, cultural, and political maps at which we have just glanced. In the spread of languages, as in the propagation of religions and cultures and the building of empires, the narrow seas dividing an 'Asia' from a 'Europe' never proved to be a barrier and frequently provided a highway. The waters of the Aegean wafted the Greek language from the 'European' to the 'Asiatic' side of this conductive sea at least as early as the age of the post-Minoan Völkerwanderung (*circa* 1425-1125 B.C.). The Thracian-speaking peoples, who spread north-westward perhaps as far as Upper Silesia after they had broken out of the Great Western Bay of the Eurasian Steppe into the preserves of *Homo Agricola*, also spread south-eastward perhaps as far as North-Western Kurdistan¹ as easily as if the continuity of the hills and dales over which they drove their flocks had not been broken in this quarter by 'the silver streaks' of the Bosphorus and the Dardanelles.

The ineffectiveness of the narrow seas as an obstacle to the spread of the Thracian-speaking peoples was attested by the appearance of the same Thracian tribal names on both the European and the Asiatic side. There were Thyni on the Ismid Peninsula, as well as in the Istranja Mountains overhanging the west shore of the Black Sea just across the Bosphorus. The Phrygians of the Anatolian Plateau and Bebryces of the Qaramursal Peninsula on the Asiatic shore of the Marmara had left a rear-guard in Europe whose name might have passed into oblivion² if these Macedonian Brygi had not once crossed the path of History by falling foul of the Persian Mardonius's expeditionary force in 492 B.C.³ An equally obscure rear-guard of the Mysian occupants of the Asiatic hinterland of the Marmara survived in a nook between the Balkans and the Lower Danube to give their name to the Roman province Moesia. Conversely, the Dardani whose main body had dug themselves in on the watershed between the basins of the Morava and the Vardar in the heart of the Balkan Peninsula had thrown an advance party into the

¹ See VI. vii. 604-5 and 660-2, and pp. 432-3, above. Herodotus (Book V, chap. 3) estimated that the Thracians were the most numerous of all peoples with the sole exception of the Indians.

² Like the forgotten name of the European rear-guard of the Hittites who had blazed the trail for the Phrygians in the second millennium B.C.

³ See Herodotus, Book VI, chap. 45.

Troad across straits that preserved the record of this tribal migration by acquiring from it the name 'Dardanelles'.¹

The Thracian-speaking peoples' migration across the Straits in and after a post-Minoan *Völkerwanderung* was emulated in the third century B.C. by the Celtic-speaking peoples when a sudden diversion of Macedonian arms from the conquest of the barbarian hinterland of European Greece to the conquest of the Achaemenian Empire invited Celts, whom Philip's aggression had provoked, to take a hand in the scramble for Alexander's spoils;² and the ineffectiveness of the Straits as a barrier against a *Völkerwanderung* was attested once again by the appearance of the same tribal name *Tectosages* both in an Asiatic Galatia round Ankara and in a European Gaul round Toulouse. Even after the barbarians' well-worn highway across the Straits had been obstructed by the foundation of Constantinople, the Goths and the Slavs in turn followed the trail of the Hittites and the Phrygians and the Gauls out of Europe into Asia—as deportees, if not as conquerors—while in the opposite direction a legendary feat of the Mysi and the Teucris³ was performed in real life by Ottoman Turkish migrants who conquered and colonized Rumelia from an Anatolian base of operations in the fourteenth century of the Christian Era.

The nullity of the Narrow Seas as a cultural barrier is demonstrated so conclusively as to raise the question why it was that any Hellenes should ever have thought of trying to find a dividing line between an Hellenic and an Oriental World in a waterway which was actually the link between the Hellenic World's Asiatic and European provinces. How did any school of Hellenic thought ever come to think of the Aegean Sea, which was in reality the central thoroughfare of Hellas, as demarcating her eastern boundary, when the effect of drawing a cultural frontier along this line was to declare the Asiatic half of Hellas to be out of the Hellenic World's bounds? The explanation of this perverse cultural misinterpretation of a pair of nautical terms divorced from their original context is perhaps to be discovered in an abnormal and temporary political situation which placed the Asiatic and the European half of Hellas in an unfortunate relation with one another.

During the period between the conquest of the Continental Asiatic Greek city-states by the Lydian Empire and the conquest of the Continental European Greek city-states by Philip of Macedon, the European Greeks were able to look down upon the Asiatic Greeks for having lost their political independence, while the Asiatic Greeks could still look down upon the European Greeks on the score of their relative cultural backwardness; and it was not till after the opening of the post-Alexan-

¹ The Dardani who founded Dardanus on the Hellespont ('Dardanelles') were probably an Illyrian-speaking, not a Thracian-speaking, people, but their passage of the Straits tells the same tale as the Thracian-speaking peoples' migration across the same narrow seas.

² See II. ii. 281 and V. v. 209.

³ See Herodotus, Book V, chap. 13, and Book VII, chap. 20. Presumably this legend was founded on the appearance of the tribal name Mysi-Moesi in both North-Western Anatolia and the Balkan Peninsula. This pair of homonyms did commemorate a migration; but the Hellenic observer who interpreted the evidence correctly thus far made the mistake of assuming that the Asiatic Mysi must have been the progenitors of the European Moesi because they happened to be the less insignificant of these two sister tribes in the pre-Alexandrine Age of Hellenic history.

drine Age that the superficiality of this temporary differentiation between the two halves of Hellas once more became apparent. The truth was that the Continental Asiatic Greek city-states lost their political independence to a Hellenized Lydia some 250 years before the Continental European Greek city-states lost theirs to a Hellenized Macedonia just because the Asiatic Greeks were culturally so much more precocious than their European kinsmen that the radiation of their culture brought the adjoining sub-Hellenic Kingdom of Lydia up to a level of cultural efficiency at which it was politically capable of subjugating its Greek spiritual pastors and masters about a quarter of a millennium before the same stage was duly reached in the parallel history of the relations between the European Greeks and the adjoining sub-Hellenic Kingdom of Macedon. In the meantime the European Greeks could find a facile psychological compensation for their oppressive consciousness of cultural inferiority to their Asiatic kinsmen by assuring themselves that the Asiatic Greeks' loss of a political independence which the European Greeks had so far managed to retain was a proof that the Asiatic Greeks were decadent, and that, if such decadence was the price of sophistication,¹ then the European Greeks' own ingenuousness was, on balance, a happier state.

This legend of the Asiatic Greeks being decadent was disproved, as we have noticed in another context,² by the sequel to Alexander's overthrow of the Achaemenian Empire. This sequel showed that the eclipse of Asiatic Greece between 494 and 334 B.C. had been due to the peculiarly adverse situation in which the Asiatic Greeks had found themselves in the Achaemenian Age. The Achaemenian conquest of Lydia and her Continental Asiatic Greek dependencies in 547 B.C. meant something much more serious for the Asiatic Greeks than just the replacement of one foreign political ascendancy by another. It meant the substitution

¹ One amusing symptom of the Asiatic Greeks' continuing intellectual vitality in the fifth century B.C. was the part played by Herodotus of Halicarnassus and by the Hippocratean school of medicine in Cos in propagating the legend that the politically subjugated Asiatic Greeks were in some sense beyond the pale of a Hellas who was nowhere quite fully herself except on the free soil of Europe. In putting into circulation a theory that was uncomplimentary to their own half of Hellas, the fifth-century Asiatic Greek men of science were giving evidence of their intellectual honesty, and at the same time they displayed their intellectual acumen in the discrimination with which they interpreted the theory in the light of the facts. In the Hippocratean treatise on *Influences of Atmosphere, Water, and Situation* the thesis that the Asiatics are on the whole less brave, tough, hard-working, and spirited than the Europeans is based (chap. 12), not on some imaginary difference of magic virtue in the soil of the two continents, but on a general theory of a correlation between physical environment and human *ethos* (see the passages quoted from op. cit., chaps. 13 and 24, in II. i. 251-2). The Hippocratean argument starts from the premiss that in Asia the physical environment is more benign than it is in Europe; and, on the Hippocratean hypothesis that hard countries breed strong characters, it follows that the inhabitants of Asia are less warlike than those of Europe on the whole (chaps. 12 and 23). At the same time the variety of the physical environment in Europe breeds a variety in the physique of the European peoples (chaps. 23 and 24), while a variety in the *ethos* of the Asiatic peoples is produced by the variety in Asiatic political conditions. The relative unwarlikeness of a majority of the Asiatics is due not merely to the relative benignity of the Asiatic physical environment but also to the political fact that most Asiatics live under a monarchical régime which deprives them of the incentive to exert themselves and risk their lives. 'The Hellenes and non-Hellenes in Asia who are not under despotic rule, but are free agents and struggle for their own benefit, are as warlike as any populations in the World' (op. cit., chap. 16, quoted in II. i. 471, n. 1).

² In IV. iv. 20-23.

of Persian masters who were barbarian converts to an alien civilization for Lydian masters who had been the conquered Hellenes' own cultural disciples; and the Asiatic Greeks merely kept on falling out of the frying pan into the fire when their Attic European kinsmen 'liberated' them from an Achaemenian yoke in 479 B.C. and when their Spartan European kinsmen replayed this comedy by 'liberating' them from an Athenian yoke in the last phase of the Atheno-Peloponnesian War of 431-404 B.C. in order to sell them back to the Achaemenidae in 386 B.C. As soon as the new order of the post-Alexandrine Age had released the Asiatic Greeks from the peculiar tribulations to which they had been subject during the preceding quarter of a millennium, the brilliant success with which they immediately rose to the occasion showed that their vitality was unimpaired. From 334 B.C. down to the generation of Justinian the Asiatic Greeks played as prominent a part in the life of the Hellenic World as they had played before the generation of Cyrus.

In the post-Alexandrine Age of Hellenic history the thesis that the conflict between Hellenism and the Oriental civilizations was a feud between 'Europe' and 'Asia' was once more so plainly contradicted by the facts that it fell into oblivion and ceased to work mischief, but the ghost of an erroneous Hellenic theory which had been effectively discredited by the logic of events in its Hellenic birthplace unfortunately returned to haunt a Modern Western World which had laid itself open to this visitation by its reception of the Hellenic culture in a fifteenth-century Italian Renaissance. In this new setting, History repeated itself with a singular exactness. A revival of the Hellenic concept of 'continents' which was innocuous so long as this concept was employed only in its proper nautical context bred a fresh crop of trouble when the nautical terminology was once again diverted to a cultural usage.

The Modern Westerners who adopted and adapted the Hellenic mariners' geographical terminology were the peoples on the eastern shores of the Atlantic, from Castile and Portugal northwards, who opened a new chapter in both Western history and World history by mastering the art of oceanic navigation at the turn of the fifteenth and sixteenth centuries of the Christian Era; and the Hellenic terminology proved still to make nautical sense in a situation in which making the sea passage between Europe and Asia meant not just swimming across the Dardanelles or ferrying over the Aegean but circumnavigating Africa now that the banks of the Narrow Seas which divided Asia from Europe by a hair's breadth had been placed out of bounds for Western maritime enterprise by the establishment of the Ottoman Empire astride those inland sea-waters.

On the oceanic chart drawn by Western navigators in a Modern Age of Western history, 'Europe' meant the hinterland of the mariners' own home ports from Cadiz to Trondhjem and Helsingfors; 'Asia' meant the hinterland of another chain of ports, stretching from Maskat and Hormuz to Canton and Nagasaki, which the conquest of the Ocean had brought within the Western mariners' range; and 'Africa' meant the huge peninsula, jutting out from the south shore of the Straits of Gibraltar to the Cape of Good Hope, which had to be rounded by

travellers between Europe and Asia who were debarred by political obstacles from short-circuiting the circumnavigation of the Dark Continent by using the overland routes across the Bosphorus and the Dardanelles or the portages across Egypt and South-West Asia between the Mediterranean and the Indian Ocean. This oceanic application of an Aegean nautical terminology fitted all the newly discovered geographical facts that had swum into the Western mariners' ken;¹ but the Modern Western geographers entangled themselves in their turn in the intellectual and moral toils that had caught their Hellenic predecessors when they set themselves to give the continents a cultural as well as a nautical meaning.

In taking the nautical term 'Europe' to serve as a substitute for the cultural term 'Western Christendom', the Modern Westerners could plead an excuse which the Hellenes could not have pleaded when they tentatively identified 'Europe' with 'Hellas' in the fifth century B.C. The Hellenic misuse of the name 'Europe' was the more wanton of the two misnomers, because 'Hellas' or τὸ Ἑλληνικόν was always a perfectly serviceable label for the Hellenic Society from the beginning to the end of its history, whereas the Modern Westerners found themselves awkwardly at a loss, by the end of the seventeenth century, for a collective name to designate their own society and culture. The traditional name 'Western Christendom' had ceased to be applicable when, within less

¹ This Modern Western chart of the continents in an oceanic setting justified retrospectively the enumeration of a separate continent of 'Africa' which its Hellenic inventors had never quite succeeded in distinguishing from 'Asia'. The Hellenes had been enticed into inventing this Continent of Africa (*Graecè* Libya) by their passion for symmetry. On the Hellenic chart of the waters of the Eastern Mediterranean, the mouths of the Nile faced the mouths of the Aegean; and, if the *thalweg* of the sea-drowned river of which the Aegean was the lowest reach marked the boundary between Asia and Europe, the law of geographical symmetry required that the *thalweg* of the Nile should similarly demarcate Asia from another continent which could be labelled 'Libya' by an extension of the usage of the name of the country adjoining Egypt on the west. This Hellenic sailors' distinction between an 'Asiatic' and a 'Libyan' bank of the Nile would have made sense for a Nile boatman, but not for an Egyptian whose business it was to think, not in narrow terms of navigation, but in broad terms of culture. On the cultural map the Nile waterway was, of course, the spinal cord of the Egyptian World, as the Aegean Sea was the heart of Hellas. A subsequent increase in geographical knowledge led the Hellenic geographers to set back the western boundary of Asia from the east bank of the Nile to the east coast of the Red Sea; but a still uncut Isthmus of Suez presented them, on a miniature scale, with the same insoluble geographical problem as the vastly broader isthmus between the head of the Sea of Azov and the Hyperborean shore of Ocean Stream, and their eventual discovery that 'Libya' was circumnavigable made them still more doubtful about the legitimacy of trying to erect 'Libya' into a separate continent instead of treating it as a mere peninsula of Asia. It was left to Modern Western ocean-faring navigators to demonstrate that, on a marine chart, 'Africa' had a much better claim than 'Europe' had to rank as something more than a mere excrescence of Asia. From the cultural standpoint, on the other hand, the concept of 'Africa' never made any more sense than the concept of 'Europe' or of 'Asia'. Africa north of the Sahara, which was insulated culturally from Tropical Africa by an estranging desert, was linked up culturally with South-West Asia and Southern Europe by the conductive waters of the Mediterranean Sea—as was attested at the time of writing by the distribution of the Arabic language and culture and of the metropolitan territory of France. The Hellenic geographers' misgivings about the feasibility of distinguishing an 'Africa' from an 'Asia' were justified by the configuration of a latter-day Arabic World which stretched across South-West Asia and North Africa from Iraq to Morocco inclusive without a break. The administrative organization of Algeria to constitute three French departments which ranked juridically as an integral part of France herself was a political testimony to the geographical fact that, whatever the mariner's chart might say, the Maghrib was for practical purposes a European, not an African, country.

than half a century of the opening of the modern chapter of Western history, the outbreak of the Protestant Reformation had split the Western World in two on the ecclesiastical plane;¹ and the retention of the word 'Christendom' in the title of the Western World had become still more incongruous when, after the close of the Wars of Religion, the Westerners—Catholics and Protestants alike—had deliberately sloughed off their society's traditional chrysalis and had proceeded to propagate their culture all over the face of the planet in a dehydrated secular abstract of its original plenary form.

When the Western Society's historic name had thus been made obsolete by the early modern course of Western history, the Hellenistic-minded spokesmen of a Modern Western culture consulted their familiar Hellenic oracles for guidance in their search for a convenient alias for a 'Christendom' that had become an awkward terminological anachronism in the vocabulary of a post-Christian Western World.² The Hellenes' geographical concept of a *terra firma* articulated into 'continents' had served the Hellenes' Modern Western disciples well when they had adopted this Hellenic pattern of geographical thought in its original nautical usage. Why not follow a step farther in the Hellenic geographers' traces by giving the names of the continents a cultural as well as a navigational connotation? Reinterpreted on this Hellenic precedent, the name 'Europe' offered an alias for the name 'Christendom' that was free from the old name's now misleading religious associations. The Western minds that put this Herodotean cultural usage of the word 'Europe' into circulation in the Modern Western World might be forgiven for having failed to perceive that in taking this way of extricating themselves from one awkward plight they were implicating themselves in another; but, however excusable their error of judgement might be, its intellectual and moral consequences for both the West and the World were as unfortunate as if these coiners of a secular name for a de-consecrated Western Christendom had been actuated by malice prepense.

The most glaring intellectual weakness of this unlucky usage was that it was a desperate geographical misfit. A Western World that was now calling itself 'Europe' had never embraced the whole of the European continent up to the water boundaries assigned to it in the original Hellenic nautical usage of the word, while on the other hand the West had already expanded overseas into regions which could not be deemed to be parts of Europe on any reading of the map.

The quarter of Europe which was indisputably entitled to bear the name was the European hinterland of the shores of the chain of narrow seas running up from the mouth of the Aegean to the head of the Sea of Azov. This had been the first quarter of the continent to which the name 'Europe' had ever been applied; but this south-eastern nucleus of Europe had always lain outside the bounds of the Western World in the medieval as well as in the modern chapter of Western history; it had lain, and still lay, within the domain of the main body of Eastern Orthodox Christendom; and an abortive Medieval Western Christian attempt

¹ This point has been noticed already in I. i. 33-34.

² See Halecki, *op. cit.*, p. 51.

to annex that alien Christian body social to Western Christendom had defeated its own purpose by resulting in the establishment of Ottoman Muslim rule over the European as well as the Asiatic provinces of Orthodox Christendom with the exception of Russia.¹ A Modern Western World which thus fell short of being conterminous with Europe in one direction had, however, burst the bounds of Europe in another direction when it had inaugurated the opening of the modern chapter of Western history by the historic act of mastering the Ocean;² and an ocean-borne expansion of a hitherto merely West European society over the whole face of the planet, which had been initiated in and after the turn of the fifteenth and sixteenth centuries of the Christian Era on the economic and political planes, was extended, as we have seen,³ to the cultural plane as well, as soon as a former religious impediment to a reception of the Western culture by non-Western societies had been removed by the action of the Westerners themselves in secularizing their way of life at the turn of the seventeenth and eighteenth centuries. As a label for the domain of the Western Civilization from that date onwards, the name 'Europe' was thus on the one hand too narrow to cover the West's thenceforth rapidly expanding non-European cultural empire, while on the other hand it was too broad to be reconcilable with the no less pertinent fact that South-Eastern Europe still lay outside the Western Society's cultural bounds.

This inapplicability to South-Eastern Europe of the Modern Western usage of the word 'Europe' as an alias for the Modern Western World not only made intellectual nonsense of the cultural situation in that culturally non-Western quarter of a 'continent' that had no unity, and indeed had no existence, in any other setting than a mariner's chart; this Modern Western usage of the word 'Europe' as a synonym for the West also made moral mischief by suggesting to self-confident and self-righteous Modern Western minds the preposterous implication that the cultural diversity of South-Eastern Europe from the western extremity of 'the European Continent' was the monstrous outcome of a scandalous miscarriage of History which could be, and should be, put right by some benevolently high-handed exercise of Modern Western power. In drawing this misguided moral from an erroneous interpretation of the facts, the Modern West was adopting an attitude towards the contemporary Islamic and Orthodox Christian worlds that was bound to breed mutual misunderstanding and ill-feeling.

The Modern Western assumption that South-Eastern Europe was part of the Western Civilization's patrimony *ex officio*, in virtue of the West's unauthorized appropriation of the name 'Europe' as a label for itself, was a 'geopolitical' dogma that was irreconcilable with the historical facts; yet the evidence of the facts did not deter nineteenth-century Western Liberals from pronouncing pontifically that the Turks were trespassers in Rumelia,⁴ and that *a fortiori* these interlopers had no

¹ See pp. 151-2, 362, and 395-7, above.

² This point is noticed by Halecki in op. cit., pp. 51 and 54.

³ On pp. 516-18, above.

⁴ 'Rumili', the Turkish name for 'Turkey-in-Europe', meant 'the land of Orthodox Christendom' (*Turci'de Rûm*), signifying the [East] Roman Empire). If South-Eastern

business to bear rule there, because they were 'Asiatics', not 'Europeans', in origin. These impulsive Gladstonians clamoured for the expulsion of the Turkish intruders from Europe 'bag and baggage'¹ without ever taking the trouble to put their draconian programme to the proof of confronting it with the elementary facts of Ottoman history. These facts were that the Ottoman Empire, like its forerunner the Greek Orthodox Christian Principality of Nicaea, had expanded over the European territories of Orthodox Christendom from a starting-point on Asiatic Orthodox Christian ground because it had a political and a social mission to perform for the whole of the main body of Orthodox Christendom on both sides of the Straits. Eastern Orthodox Christians had acquiesced in Ottoman Muslim rule, in preference to Western Christian rule, because their Ottoman conquerors had shown themselves capable of imposing peace on a distracted Orthodox Christendom whose confusion had merely been worse confounded by the escapades of the Western Crusaders.

In the nineteenth century of the Christian Era no less than in the fourteenth, the acid test for passing judgement on the Ottoman régime was the current state of the account between the benefits conferred by the *Pax Ottomanica* on the Pādishāh's subjects and the cost of the oppression that was the price of an Ottoman Peace; and in the nineteenth century an impartial judge might well have pronounced that the Porte had exhausted its mandate; but this verdict would have conferred a moral claim to liberation from an Ottoman Turkish yoke, not just upon the Porte's non-Turkish subjects in 'Turkey-in-Europe', but upon all its non-Turkish subjects, whatever religion they professed and whatever language they spoke and whatever continent they inhabited. A discredited Ottoman Turkish imperial people's African and Asiatic Arabic-speaking Sunni Muslim co-religionists would have had the same good case for demanding liberation as the European Orthodox Christians, and the Asiatic Arabic-speaking Orthodox Christians and Maronites and Druses the same good case as the European Albanian-speaking Tosk and Serbo-Croat-speaking Bosniak Sunnis. The test was the current balance-sheet of the Ottoman régime, and the issue was a subject's moral claim to be liberated from a régime that had forfeited its moral title to rule. In this moral issue the query whether the victim of misgovernment happened to be domiciled in the European, the Asiatic, or the African dominions of its discredited oppressors was pedantically irrelevant; and no approach to the nineteenth-century problem of the

Europe had been Western and not Orthodox Christian ground at the time when the 'Osmanlis' occupied it, they would have called it, not 'Rumili', but 'Feringhistan' ('Frankland').

¹ 'Let the Turks now carry away their abuses in the only possible manner, namely by carrying off themselves. Their zaptiehs and their mudirs, their bimbashis and their yuzbashes, their kaimakams and their pashas, one and all, shall, I hope, clear out from the province they have desolated and profaned' (Gladstone, W. E.: *Bulgarian Horrors and the Question of the East* (London 1876, John Murray), p. 31).

'The profaned and desolated province' of this celebrated passage was not the whole of 'Turkey-in-Europe' but only that portion of Rumelia that was inhabited by the Bulgars; but the more sweeping programme proclaimed in the simpler slogan 'Expel the Turks from Europe' was the ultimate objective of Gladstone and his fellow Turcophobes in a nineteenth-century Western World that had identified 'Europe' with itself.

Ottoman Empire's future could well have been more perverse than the Modern Western Liberal publicist's uncritical adoption of the Herodotean fantasy of a perennial feud between 'Europe' and 'Asia'—as if the 'European' subjects of the Ottoman Porte were entitled to liberation, not on a moral ground which was equally applicable to their 'African' and 'Asiatic' fellow victims, but on the geographical score of being inhabitants of a privileged continent.¹

The Modern Western identification of the Western World with 'Europe', which had this distorting effect on Western policy towards the Ottoman Empire in the nineteenth century, persisted into the twentieth century to exacerbate an ideological quarrel between the West and a Communist Russia.

The self-deconsecration of the Western World towards the close of the seventeenth century of the Christian Era did not bring with it any essential change in the traditional Western attitude towards Orthodox Christendom. Since the establishment of a Western military, political, and economic ascendancy over the main body of Orthodox Christendom in the sequel to the collapse of the East Roman Power, the Medieval Westerners had come to look upon their Eastern Orthodox neighbours, no longer as their superiors or even as their peers, but as obstinately unsatisfactory poor relations who must be coerced into making a public confession of sin and profession of repentance, in the form of a solemn acknowledgement of the Papacy's ecclesiastical supremacy over the churches of the Greek Rite, as a condition *sine quâ non* for being considered eligible for receiving Western aid. A latter-day post-Christian Western Society which could no longer logically condemn the 'native Christian' subjects of the Ottoman Empire as religious heretics could still preserve and justify a traditional Western contempt for them by censuring them as 'Europeans' who had inexcusably failed to keep up with 'the progress of European Civilization'. This censure was tantamount to a reiteration, in Modern Western secular terms, of the Medieval Western Christian demand that the Orthodox Christians should renounce their own traditional culture and should adopt in its place the contemporary culture of the West. The weak point in the latter-day Western 'geopolitical' formula for taking Orthodox Christendom to task was that a majority of those indicted for the moral offence of being

¹ The fantasy that the evil of nineteenth-century Ottoman misgovernment would be cured by expelling the Turks from 'Europe' would have been reduced *ad absurdum* if this programme had ever become practical politics. The partition of the Eurasian city of Constantinople by a political frontier following the *thalweg* of the Bosphorus would have been one of the curiosities of political map-making even for a generation that had lived to see the bisection of Jerusalem and Vienna and Berlin after the World War of A.D. 1939-45. One quaint result of applying the fantastic 'geopolitical' principle that political liberty was a European privilege would have been to disqualify the chief intellectual leader of a Modern Greek Westernizing movement that had expressed itself politically in the partially successful Greek uprising against Ottoman rule in A.D. 1821. Till the great Greek exodus from Anatolia and Eastern Thrace in and after A.D. 1922, the Modern Greeks, like the Ancient Greeks before them, were equally at home on the European and on the Asiatic side of the Aegean; and Adhamándios Koraïs was in no way peculiar among the Modern Greeks of his generation in being a Smyrniot of Chiot origin (see pp. 178-9, above). This eminent scholar-patriot would have been as surprised to be told that his Asiatic provenance made him ineligible for liberation from Ottoman rule as he would have been to hear that his Arabic surname (see p. 178, n. 4, above) debarred him from being reckoned as a Greek.

'lapsed Europeans' were actually not inhabitants of Europe on any defensible definition of the boundaries of that elusive continent. Half the Modern Greek people lived in Asia, while the whole of Russia defied the most determined efforts of geographical pedantry to partition her between an 'Asia' and a 'Europe' that melted into one another round the head of the Sea of Azov.

The self-secularization of the West thus left the Western attitude towards Orthodox Christendom essentially unchanged, but it did nevertheless temporarily relieve the tension between the two sister societies by changing the Orthodox Christian peoples' feeling towards the West from an invincible repugnance to a frank admiration. The seventeenth-century distillation of a secular abstract of the Western culture was promptly followed, as we have seen,¹ by a movement in Orthodox Christendom to adopt this attractive as well as anodyne new form of a previously repulsive alien civilization; and this spontaneous Greek, Serb, and Russian imitation of a latter-day secular Western way of life was, of course, flattering to the Westerners' self-conceit. The Tsar Peter Romanov's exemplary good conduct half persuaded the Western dominie to forget the bad mark inscribed in his black book against the name of the Oecumenical Patriarch Michael Cerularius, and the next two centuries of Orthodox Christian cultural history confirmed in Western minds this reassuring impression that the truant 'East Europeans' had at last seen the light and turned over a new leaf. The dismay and indignation in the West were therefore proportionately extreme when in A.D. 1917 Russia suddenly deviated from the broad way leading to Westernization which she had been following since the close of the seventeenth century, and when she added insult to injury by resuming her pre-Petrine ideological war against the West in the name, no longer of Christian Orthodoxy, but of a post-Christian heresy of Western origin. An impartial judge of the issue between the Russian version of Communism and the contemporary Western way of life might perhaps have given judgement against the Russian party to the suit, but he certainly would not have found an aggravating circumstance in Russia's alleged apostasy from an imaginary 'European Civilization' which would have had no geographical claim on Russia's allegiance even if it had had any existence in real life.

This mirage of a 'European Civilization' was another hallucination to which Modern Western Man condemned himself when he appropriated the word 'Europe' as a name for a deconsecrated Western World. His cultural misapplication of a nautical term inevitably led him into two historical aberrations. One of these was the notion that Orthodox Christendom and Western Christendom constituted a single society because their geographical domains, taken together, were deemed to be coextensive with the limits of the mariner's European continent. The second aberration was the notion that Hellenic history and Western history were—not distinct social experiences that might be philosophically contemporaneous as well as philosophically equivalent in value²—

¹ On pp. 132-3 and 161-5 above.

² For these two conceptions of the mutual relations between societies of the species called civilizations, see I. i. 172-7.

but historically continuous as well as chronologically successive acts in a single European drama which was deemed to be a unity in virtue of its having the wonder-working soil of a privileged continent as its scene of action throughout the play. This 'European' rendering of Western and Orthodox Christian and Hellenic history could not face the music of the historical facts.

The thesis that the Western and Orthodox Christian cultures were not two cultures but one culture in virtue of their combined domains being coextensive with 'Europe' had found one of its ablest advocates, down to the time of writing, in a distinguished twentieth-century Polish historian.¹ In his exposition of this theme, Halecki strengthens his case by conceding that Europe had been an intelligible field of historical study only during a limited period that was admittedly already at an end by the date at which the European author was writing his book as an exile in America.² The European Age, as Halecki defines it, was both followed and preceded by an age in which the intelligible field of study, instead of being delimited by the coasts of a continent, was constituted by the shores of a land-locked Sea. In Halecki's view the European Age had succeeded a Mediterranean Age³ and was being succeeded by an Atlantic Age.⁴ The making of Europe had been completed in the second half of the tenth century of the Christian Era, when Poland, Hungary, and the Scandinavian countries had been converted to Western Christianity and Russia converted to Orthodox Christianity.⁵ The destruction of Europe had been completed in the fifth decade of the twentieth century, when the eastern half of the continent had been severed from the West by the descent of a Soviet Russian 'iron curtain'—a catastrophe that had been as lethal for Europe as the Primitive Muslim Arab conquest of South-West Asia and North Africa in the seventh century had been lethal for an antecedent Mediterranean World.⁶ The transition from the Mediterranean to the European Age had been a gradual process, and the eventual transition from the European to the Atlantic Age had been more gradual still.⁷ In round numbers of centuries, however, Halecki dates his European Age between A.D. 950 and A.D. 1950.⁸

This is a moderate and persuasive presentation of the case for giving the word 'Europe' a cultural connotation in addition to its plain nautical meaning. Yet even Halecki's presentation is vulnerable. For example, the assumption that, in 'the European Age', the combined areas of an Orthodox and a Western Christendom were conterminous with Europe is one that will not bear examination. During the first century of Halecki's European millennium, the centre of gravity of Orthodox Christendom still lay outside Europe, in an Anatolian Peninsula known as 'Asia Minor',⁹ while a 'Europa Minor' in the shape of the Iberian Peninsula lay outside the domain of Western Christendom, in Dār-al-Islām. On the second of these two points, Halecki might perhaps reply that, in the

Iberian Peninsula in that century, the majority of the population seems still to have consisted of an Arab and Berber Muslim dominant minority's *musta'rib* Western Christian subjects; but this rejoinder will not revalidate his thesis that, during 'the European millennium', Europe and Christendom were coextensive; for, even if, during the first half of that millennium, Western Christendom was confined within Europe's coasts, Orthodox Christendom continued to straddle the Aegean Sea and the Straits, with one foot in Europe and the other in Asia, until the exodus of Orthodox Christians from Anatolia in A.D. 1922, while, during the second half of the same millennium, when Western Christendom was spreading into the New World, Orthodox Christendom's Russian offshoot spread right across the breadth of Asia till it reached the western shore of the Pacific and leaped over the Behring Straits into the Alaskan Peninsula of North America.

Moreover, the Orthodox and the Western Christendom were only two out of four sectors into which the circular wave of Christianity had come to be articulated in the course of its expansion.¹ The Roman sector in Western Europe and the Orthodox sector in Eastern Europe and Anatolia were balanced by a Monophysite sector extending from Armenia to Abyssinia inclusive through Syria and the Nile Valley and by a Nestorian sector extending from 'Irāq to the north-east corner of Intramural China; and neither of these two other quarters of Christendom had any foothold in Europe. During the first 250 years of Halecki's European millennium, before the mass-conversions to Islam on the eve of the fall of the 'Abbasid Caliphate of Baghdad, a Monophysite Christendom that still embraced the peasantry of Egypt and a Nestorian Christendom that still embraced the peasantry of 'Irāq were perhaps each of them as strong in numbers as either their Orthodox or their Western sister Christian society; and, when the whole of Christendom, instead of merely two arbitrarily selected quarters of it,² is thus taken into account, it becomes manifest that either Asia or Africa could have disputed Europe's claim to style herself 'the Christian Continent' *par excellence* until at least the first four out of Halecki's ten European centuries had run out. If there was a moment—between the late medieval decline of the Monophysite and Nestorian Christian waves in Africa and Asia and the early modern advance of the Orthodox and Western Christian waves into Asia and the Americas—at which Christendom and Europe were in truth approximately conterminous, that moment cannot have had a longer duration than the hundred years immediately preceding the Western mariners' conquest of the Ocean in the later decades of the fifteenth century. Yet, even during that brief interval, the identity between Europe and Christendom was imperfect; for, in the fourteenth and fifteenth centuries of the Christian Era, an Islam that was still

¹ See II. ii. 360-9.

² Halecki's arbitrariness in deeming an Orthodox and a Western Christendom to constitute a unitary Christian society, to the exclusion of both a Monophysite and a Nestorian Christendom, is capped by his arbitrariness in excluding Muscovy, and *a fortiori* the Soviet Union, from a Europe which, for him, is synonymous with Christendom, when he has bestowed the freedom of Europe on Muscovy's predecessor Kievan Russia (op. cit., p. 92), as well as on a predominantly Anatolian East Roman Empire (op. cit., p. 93).

clinging to a remnant of its own domain in a European Andalusia was already encroaching on Christendom's domain in a European Rumelia as well as in an African Nubia¹ and in an Asiatic 'Irāq and Azerbaijan.²

While Europe thus failed to provide a geographical framework for the merger of Orthodox with Western Christendom in a single unitary Christian Civilization, it likewise failed to provide an historical framework for the merger of an Hellenic with a post-Christian Western culture in a single unitary Rationalist Civilization. The thesis that the Western and Hellenic cultures were not two cultures but one culture because they were both alike informed by some common distinctive quality that could be identified as being 'European' was one that could be sustained only if this hypothetical common 'European' quality could be shown to have been not merely distinctive but dominant in a *solidant* 'European' cultural tradition; and this condition in its turn required that, if any non-European contributions to this European cultural heritage could be detected, they should prove to be elements that were not of more than minor importance. It is evident that the thesis refutes itself as soon as it is thus elucidated; for it wrecks itself on two rocks at once: the Jewish contribution to a Western Civilization that was a Christian civilization as well as a Hellenistic one, and the Asiatic Greek contribution to Hellenism. The Asiatic Greeks, as we have seen, had been the pioneers of the Hellenic Civilization in the first chapter of its history, and Ionian Asiatic Greek men of science had been the intellectual fathers of a Rationalism which was taken by Modern Western minds to be the unbroken golden thread of a 'European' cultural tradition,³ but this latter-day Western belief in a 'rationalist' civilization's continuity was achieved at the intellectual price of ignoring the spiritual history of the Hellenic World after the generation of Carneades⁴ and the spiritual history of the Western World before the generation of Descartes.

A distortion of the historical facts which the chimaera of a 'European Civilization' demanded from its votaries was aggravated by the hybris which was the moral nemesis of this intellectual error. The Modern Western Narcissus who had once persuaded himself to believe in the reality of a distinctive 'European' tradition of civilization culminating in the way of life of the observer's own society in his own age was apt to lose his balance so completely as to equate this imaginary 'European Civilization' with 'Civilization' *sans phrase* and to deny the title to rank as civilizations to representatives of this species of society whose geographical domains happened to lie on the wrong side of the Argonauts' track.⁵ A Modern Westerner who had ruled all non-Europeans out of

¹ See Trimmingham, J. S.: *Islam in the Sudan* (Oxford 1949, University Press), pp. 79-84.

² See Budge, E. A. Wallis: *The Monks of Küblai Khān* (London 1928, Religious Tract Society), pp. 76-88.

³ A characteristically judicious and discriminating statement, by Edwyn Bevan, of the case for regarding Hellenic and Western history as the history of a single 'rationalist' civilization will be found in V. v. 6, n. 1.

⁴ The metamorphosis of Hellenic philosophy into religion from the generation of Poseidonius onwards has been noticed in V. v. 546-9.

⁵ The geopolitical counter-mancœuvre of equating 'Civilization' with 'Asiatic Civilization' would have been equally facile and, of course, equally illegitimate. On the analogy of the Modern Western mancœuvre that has been exposed above, this counter-mancœuvre

his reckoning of human achievement was indeed in danger of finding himself in a dizzy position. Now that he had piled his Western Pelion on an Hellenic Ossa, must he not be on the verge of scaling Olympus? The catastrophic ending of the Titans' impious enterprise according to the traditional version of the Hellenic myth gave a sardonic answer to the Westerner's conceited rhetorical question. The sin of *hybris* always makes the sinner prone to fall a victim to an egocentric illusion which is the intellectual corollary of Original Sin,¹ and in the *Weltanschauung* of a student of History this egocentric illusion is apt to conspire with the misconception of growth as a movement in a straight line² to produce a thorough-going misinterpretation of the history of Mankind.

This had proved to be the penalty that a 'European' must pay for the folly of deifying his own continent to the disparagement of the rest of the World; and the consequences of this 'European' folly were manifestly more serious for a post-Christian Frenchman or Englishman than for a pre-Christian Athenian or Peloponnesian; for the European Greeks who allowed themselves to feel superior to their Asiatic Greek contemporaries in the fifth century B.C. were at any rate free from that fanatical Judaic hallucination of being a 'chosen people' which, in the twentieth century of the Christian Era, insidiously haunted and misinspired the secular-minded heirs of a once Christian Western tradition. In adopting the name 'Europe' as a substitute for Western Christendom, the Modern Western World had replaced a misnomer that was merely an anachronism by a misnomer that was seriously misleading.

could have been executed in two steps. In the first place the Hellenic Civilization could have been called 'Asiatic' without departing farther from the truth than the departure made by Aeschylus and Herodotus and their Modern Western followers when they labelled as 'European' a civilization that bestrode both continents. In the second place the mantle of Hellenism could have been declared to have fallen upon the shoulders of Orthodox Christendom without doing any greater violence to the facts of history than was done by Westerners who claimed that the West was Hellas' sole heir, when the truth was that the two sister Hellenistic civilizations of Western and Eastern Orthodox Christendom were both equally entitled to claim heirship to the Hellenic heritage. This counter-Western inversion of a Western misinterpretation of history would have led straight to the conclusion that there was an 'Asiatic Civilization' which was tantamount to 'Civilization' with a capital 'C'.

¹ This egocentric illusion has been examined in I. i. 157-64.

² See I. i. 168-71.

IX. D (ii), ANNEX

THE MERCENARY SOLDIER'S ROLE AS A CULTURAL SPEARHEAD

If an assaulted society succumbs to Human Nature's instinctive irrational abhorrence of anything that is alien and unfamiliar when the challenge takes the form of an encounter with a militarily superior neighbour, the consequences of this instinctive reaction sometimes illustrate the truth that to yield to the promptings of fear is apt to be the most dangerous of all possible alternative courses.

The at first sight apparently most non-committal way for an assaulted society to enlist in its own defence its assailant's military technique is, not the hard course of acquiring, handling, and eventually manufacturing for itself the weapons and equipment, and mastering the drill, tactics, strategy, and military organization, that are the secrets of the assailant's military superiority, but the facile expedient of simply hiring representatives of this militarily superior impinging society to wield their own exotic weapons, execute their own exotic tactics and strategy, and apply their own exotic organization as mercenary soldiers, officers, and administrators in the assaulted society's service. In other contexts¹ we have observed how civilizations embodied in universal states have delivered themselves into the hands of the transfrontier barbarians when they have followed the clever-seeming device of setting a thief to catch a thief by recruiting barbarian mercenary troops to defend the *limes* against the barbarian war-bands that are assailing it. Civilizations have also brought the same fate on themselves by the still more hazardous manoeuvre of enlisting the military services of militarily superior neighbours when these neighbours have been, not barbarians, but representatives of a society of the employer-society's own species.

Instances in which the enlistment of mercenary troops from the ranks of a militarily superior alien civilization has paved the way for the establishment of this alien civilization's domination over the society that has thus with its own hands introduced a Trojan Horse into its precincts are the enlistment of Hellenic mercenary troops by the Achaemenian Imperial Government during the hundred years ending in Alexander's passage of the Dardanelles in 334 B.C.² and the enlistment of Toltec mercenaries to fight the fratricidal battles of the city-states of Yucatan in the last chapter of Yucatec history before the forcible incorporation of the Yucatec Civilization into the Mexic—if this is the correct reconstruction of that chapter of Central American history.³ The enlistment of Norman and other Western Christian mercenaries by the East Roman Imperial Government during the 150 years ending in the overthrow of the East Roman Empire by so-called 'Crusaders' in A.D. 1204 likewise prepared the way for this eventual disaster—and in this case the ultimately disastrous consequence of employing mercenaries recruited from

¹ See V. v. 159-69; VI. vii. 329-38; and pp. 41-44, above.

² See VI. vii. 328-9.

³ See I. i. 123-4.

a society in process of civilization is the more remarkable, considering that the East Roman Empire—like the Carthaginian Empire in its day—had been singularly successful in eluding the similar disaster which it had courted by enlisting the services of all manner of barbarians, ranging from the horse-archers of the Eurasian Steppe to the Scandinavian and English axe-men who manned the Varangian Imperial Guard.

This political risk to which a civilization exposes itself in giving military employment to members of an alien society of its own species is not eliminated when the employer-society abstains from enlisting an alien rank-and-file and confines itself to commissioning alien officers to take command of native troops. The handful of Western soldiers of fortune who were employed in this capacity by the governments of the native Indian successor-states of the Mughal Rāj in India during the hundred years ending in the final overthrow of the Sikh Power by British arms in A.D. 1849 were forerunners of an alien universal state of Western origin in the shape of the British Rāj.¹ This Indian experience indicates that alien military officers cannot be employed with impunity unless their function is restricted—as it was in Petrine Russia and in the Ottoman Empire under the régime inaugurated by Selīm III and Mahmūd II—to providing an alien haven for a corps of officers in which the personnel is still recruited in the main from native sources even after the reception of an alien military technique and alien art of war.

One of the lines along which the private Western military adventurers in a post-Mughal India blazed a trail for the British East India Company, and eventually for the British Crown, was their practice of undertaking the organization as well as the command of the armies of the Mughal Rāj's successor-states, insisting on their employers' assigning to them portions of their land revenues to finance this new-model military organization, and finally taking over the administration of the districts producing these revenues in order to ensure the collection of their dues. This was the method by which the East India Company succeeded in swiftly transforming its own relation with one local Indian state after another from a casual and temporary military alliance into a political control which was apt to grow progressively more effective until at last it became indistinguishable from a plenary sovereignty.

"The system soon reached the stage when the native ally was required to supply not men but money, and the English undertook to raise, train, and pay a fixed number of troops on receiving a subsidy equivalent to their cost. . . . Large sums had hitherto been spent by the native princes in maintaining ill-managed and insubordinate bodies of troops, and in constant wars against each other; they might economise their revenues, be rid of a mutinous soldiery, and sit much more quietly at home, by entering into contracts with a skilful and solvent administration that would undertake all serious military business for a fixed subsidy. But, as punctuality in money matters has never been a princely quality, this subsidy was apt to be paid very irregularly; so the next stage was to revive the

long-standing practice of Asiatic governments: the assignment of lands for the payment of troops. . . .

"The Oudh Vizier was a weak ruler whose country was in confusion, whose troops were mutinous, and whose finances were disordered by the heavy strain of the English subsidy. In these circumstances Lord Wellesley required the Vizier to disband his disorderly forces in order that more British troops might be subsidized for the effective defence of his dominions. . . . The Vizier ceded all his frontier provinces, including Rohilcund, to the Company, the revenue of the territory thus transferred being taken as an equivalent to the subsidy payable for troops. . . . And Oudh was thenceforward enveloped by the English dominion. This most important augmentation of territory transferred to the British Government some of the richest and most populous districts in the heart of India."¹

CONTACTS BETWEEN CIVILIZATIONS IN TIME (*Renaissances*)

A. 'THE RENAISSANCE'

THE metaphorical application of the French word *renaissance* to denote the 'rebirth' of an extinct culture was a Modern Western usage; and, for Western minds whose vocabulary had come to include this term, the first association of the word 'renaissance', in this latter-day technical meaning of it, was in the singular, not in the plural, and as a proper name, not as the label of a species.¹

Modern Western historians were apt thus to speak of 'the Renaissance' under the spell of the same egocentric illusion² that had prompted *Homo Terricola* in all societies and all ages to speak of 'the Earth', the 'Moon', 'the Sun'. Such *façons de parler* were, of course, as unscientific as they were insidious, and as insidious as they were subjective. They were expressions of an unsophisticated observer's uncritical assumption that his own ego is the centre of the Universe and that a panorama seen from his personal angle of vision is a true picture of the Universe as it really is. In this same egocentric frame of mind an inhabitant of another of 'the Planets' would use *Terricola's* familiar term 'the Earth' to mean the planet whose surface happened to be *his* habitat. If, for example, he happened to be a Martian, 'the Earth' would mean for him the planet Mars and not the planet Terra. On the other hand, *Terricola's* term 'the Moon' would not have any counterpart in other planetary vocabularies, since a diverse parochial experience would have accustomed inhabitants of Jupiter to speak of 'the Moons' in the plural and inhabitants of Saturn to speak, instead, of 'the Ring', while inhabitants of other planets, if un-equipped with telescopes, would deny that such phenomena as either 'moons' or 'rings' were to be seen among the heavenly bodies. It is true that, when they spoke of 'the Sun', inhabitants of any of 'the Planets' would be referring to one and the same star; but, when a 'twentieth-century' *terricola* was reminded, by the spectacle of 'the Milky Way', that suns were as common as dirt, and when he went on to reflect that any of these innumerable suns might have numerous planets revolving round it, he was forced to realize that his habitual phrase 'the Planets' was as provincial an expression as 'the Moon', and 'the Sun' as crass a provincialism as 'the Earth'. Nor did 'the Milky Way' itself fare any better; for *Homo Terricola's* latter-day astronomers had informed him that this smoke-ring composed of stars, including his native planet's sun, was, itself, simply one of a number of nebulae in diverse stages of

¹ In Larousse, P.: *Grand Dictionnaire Universel du XIX^e Siècle*, vol. xiii, p. 936, the earliest French author cited as having used the word 'renaissance' in this technical sense is E.-J. Delécluze (*vivebat* A.D. 1781-1863). In the *New English Dictionary* the earliest passage cited dates from as late as A.D. 1845.

² See I. i. 158-65.

condensation. These astronomical illustrations of the egocentric illusion's distorting effect upon the appearance of Reality were illuminating commentaries on the customary Modern Western usage of the word *renaissance*.

In ordinary Modern Western parlance the singular expression 'the Renaissance' was used to denote something that had happened in one local province of one civilization in one age of its history on two planes of its activity. The particular civilization in question was Western Christendom, the particular province was Northern and Central Italy,¹ the particular age was the Late Medieval period of Western history (*circa* A.D. 1275-1475), the particular activities were the literary and visual arts. The occurrence that was identified by being labelled with this name invented for it *ad hoc* was the evocation—at this time and place, and within these two spheres of cultural action—of the 'ghost' of a 'dead' civilization; and the *revenant* thus called up from Sheol by this feat of cultural necromancy was the shade of an Hellenic culture to which the Western culture was affiliated.²

If our reminder of the distorting effect of the egocentric illusion on our mental picture of the stellar universe has put us on the alert against the danger of error to which this besetting illusion exposes human minds in all their mental operations, we may feel it worth while to re-

¹ i.e. the aboriginally Western Christian parts of the Italian Peninsula, as distinct from a *ci-devant* Byzantine South (see I. i. 32 and 38).

² This evocation of two facets of the Hellenic culture in a Late Medieval Italy was the occurrence to which the label inscribed 'the Renaissance' properly attached; but in popular parlance the usage of the term was sometimes incorrectly narrowed and sometimes incorrectly widened. It was sometimes confined to denoting the enrichment of an Italian renaissance of Hellenism in Latin dress, at a date by which this was already a going concern, through the fifteenth-century Italian humanists' acquisition from Constantinople of original works of Hellenic literature in the medium of the Classical Greek language (see IX. viii. 102). In reality, this Greek contribution to a Late Medieval Italian renaissance of Hellenism was the by-product of a contact in the Space-dimension between a Late Medieval Italy and a contemporary Orthodox Christendom which happened to be a 'carrier' of those Greek elements of an extinct Hellenic culture that the Italians acquired from this Byzantine source in the fifteenth century. On the other hand the meaning of the term 'the Renaissance' was sometimes extended to include the radiation of a Late Medieval Italian sub-culture into the Transmarine and Transalpine provinces of Western Christendom at the transition from the Medieval to the Modern Age of Western history.

In thus transmitting its own special culture to 'the Barbarians', a Late Medieval Italy did, of course, transmit the achievements of her evocation of Hellenism among her other current cultural commodities. But the diffusion of the Italian culture at this date was, in itself, not a renaissance but an encounter between two diverse contemporary Western sub-cultures within the bosom of a Western body social that was their common social setting. (The measure of the gulf by which these two Late Medieval Western sub-cultures had come to be divided by the time when their encounter began was given in a striking visual form by the contrast in style, and still greater contrast in ethos, between the native English sculpture and the imported Florentine master Pietro Torrigiani's work in the English King Henry VII's chapel in Westminster Abbey). This Italianization of the non-Italian provinces of the Western World of the day was a consequence of the Italians' success in forging ahead of the rest of Western Christendom in the course of the two preceding centuries; Italy had already won this lead in a cultural race between the divers provinces of a Medieval Western Christendom before the Italian renaissance of Hellenism had started; and, in virtue of this lead, the eventual diffusion of a Late Medieval Italian culture beyond the Alps and across the Western Mediterranean would assuredly have taken place even if there had been no Italian renaissance of Hellenism at all, or if there had been one that had never gone beyond a mere revival of the second-hand Latin version of the Hellenic literature, without any fifteenth-century Italian recourse to Hellenism's Greek fountain-head (see IV. iv. 275, nn. 1 and 2, and 363, n. 1, and IX. viii. 102, n. 2).

consider the customary Western conception of 'the Renaissance' in a critical spirit; and, as soon as we enter upon this re-examination, we shall find that the popular usage of the term in the singular, to describe a Late Medieval Italian literary and artistic movement, was at variance with the historical facts in at least three respects. In the first place it did not cover the whole field even of the Late Medieval Italian renaissance of Hellenism, since it left out of the picture a political facet that, in the twentieth century, was still dominating the social landscape of a Late Modern Western World in which the literary and artistic traces of 'the Renaissance' had been gradually fading out.¹ In the second place the use of the word *renaissance* as a proper name for the evocation of Hellenism in a Late Medieval Italy ignored the fact that there had been other renaissances of Hellenism, in other provinces of Western Christendom, at other times in Western history (later, as well as earlier, than the Late Middle Ages), and that these other Western renaissances of Hellen-

¹ A child of a Late Modern Western Civilization who had had the good fortune to have been born just in time to have received a Late Medieval Italian (*alias* Early Modern Western) Hellenic education in the Greek and Latin languages and literatures was sadly aware, by the year A.D. 1952 (if he had had the further good or bad fortune to have survived two world wars), that he and his class-mates might be all but the last Western initiates into an Hellenic *Weltanschauung* which had been a veritable 'Illumination of the Soul' (to use Acton's words, quoted above in I. i. 47) for all those children of the West who had been given the opportunity of participating in this inspiring intellectual experience. In the Western educational arena by the year A.D. 1952 the humanist's curriculum introduced through a Late Medieval Italian renaissance of Hellenism had been put out of the running and all but pushed off the track by a physicist's curriculum representing an aboriginal Western *Weltanschauung* which, after having been put out of countenance for a season by the dazzling splendour of the Hellenic *revenant*, had been progressively reasserting itself ever since a native Western genius for an empirical and experimental exploration and exploitation of the Physical Universe had achieved a counter-renaissance in winning 'the Battle of the Books' at the turn of the seventeenth and eighteenth centuries (see IV. iv. 363, n. 2, and pp. 62-73, below).

In appraising, *circa* A.D. 1952, the policy pursued by a Late Modern Western World in discriminating, and selecting for retention or discard, the divers elements of the Hellenic culture that had been recaptured for the Modern West by the Italian Humanists, the last survivors of this now all but exterminated intellectual tribe might feel inclined to pray and beseech their exterminators to say after them, in language taken from the Anglican Book of Common Prayer: 'We have left undone those things which we ought to have done, and we have done those things which we ought not to have done.' In the very generation in which the literary and artistic facets of an Italian renaissance of Hellenism were being finally discarded by a post-Modern Western Man, this Caliban was not only clinging to the political facet but was pushing this resuscitated political ideology of Hellenism to extremes that had never been approached by the Hellenes themselves in their own self-immolation on the altar of an idolized Leviathan.

This selective policy that was thus being pursued by twentieth-century Western Man was, of course, as logical as it was perverse. His determination to retain the political facet, while discarding the literary and artistic facets, of Hellenism was governed by the same impulse that was moving him at the same time to give rein to his own native bent for Physical Science. Like this native Western physical technique, an alien Hellenic political ideology ministered to an insatiable lust for power which was the inevitable ruling passion in hearts that had relapsed from Christian to pagan worship of a Collective Humanity. This point had been noted by a Western student of Hellenism in a passage already quoted in a different context:

'Europe's infatuation for the Greeks and Romans dates from the sixteenth century, when she began her great political and military reorganisation. She admired them in all things . . . because they taught her how to organise armies, how to wage wars, and how to build up great states' (Ferrero, G.: *Peace and War* (London 1933, Macmillan), p. 194, quoted in VII. vii. 542).

It looked as if a self-deconsecrated Modern Western Society had taken the political ideals of the Italian renaissance more seriously than its aesthetic ideals just because these political ideals presented a more defiant challenge to a Christian *ethos* against which a latter-day Western Man had rebelled.

ism had extended to other facets of the Hellenic culture besides the literary, artistic, and political. In the third place the customary usage ignored the still more portentous fact that there had been other renaissances of Hellenism in the histories of at least one other Hellenistic Civilization besides Western Christendom, and other renaissances of other 'dead' cultures besides Hellenism in the histories of other civilizations of the third generation besides the two Hellenistic Christian societies.

As soon as we have thus brought all the relevant phenomena into view, we become aware that, in using the word *renaissance* as a proper name, we have been allowing ourselves to fall into the error of seeing a unique occurrence in an event which in reality was no more than one particular instance of a recurrent historical phenomenon. The evocation of a dead culture by the living representatives of a civilization that is still a going concern proves to be a species of historical event for which the proper label is, not 'the Renaissance', but 'renaissances'; and, in an earlier context, we have already identified the genus to which this species belongs. The raising of a ghost by a necromancer produces an encounter between the medium and his oracle; and such encounters between the living and the dead are one species of a generic phenomenon which presents itself in a different specific form in encounters in which both parties are alive at the time when they collide with one another. The species of encounter in which the contact takes place between contemporaries has been the subject of the immediately preceding part of this Study; and, in finding our way into that field of inquiry, we have already taken note of a specific difference between contacts—of the species there examined—in which the characteristic and distinctive aspect of the encounter is a collision in the Space-dimension between contemporaries living side by side in different geographical habitats, and contacts in which the pertinent difference of location between the colliding parties is a distance measured in the Time-dimension of the chronologist and not in the Space-dimension of the geographer¹.

In the same context we have also already observed that, among encounters of the species labelled 'contacts in Time', we can identify at least three distinct varieties. There are encounters in the life, of the kind that we have labelled 'Apparentation-and-Affiliation',² between parties belonging to different, but consecutive, generations whose lives have partly overlapped in the Time-dimension. There are other encounters (and these are our present subject) in which the parties are the same, but in which the encounter takes place at a date when the party representing an older generation is no longer alive, and is therefore only able to participate as a ghost evoked by a living necromancer—in contrast to its original encounter, in the life, with an 'affiliated' civilization whose still living representatives are now awakening the dead in order to establish a fresh contact of a different kind.³ There are other encounters, again, in which one of the parts is likewise played by a ghost, but this by a ghost of the necromancer's own past self, and not by the ghost of one

¹ See IX. viii. 97.

² See I. i. 44 and IX. viii. 97-98.

³ See IX. viii. 97-98 and 101.

of his parents.¹ In this place there is no need to redefine these distinctions between an archaistic endeavour to revert to an earlier stage of the archaist's own history and the two varieties of encounter between civilizations of different generations that are distinguished from one another by the difference between the elder party's status when it participates as a living 'apparented' civilization and its status when it participates as a ghost evoked in a renaissance. There is no need, either, to reduplicate our previous examination of the phenomena of Archaism and of Apparentation-and-Affiliation; and accordingly, in the present Part of this Study, we can confine our attention to renaissances, with which we have not had occasion to deal so far, except incidentally.

Before proceeding to make an empirical survey of renaissances as a first step towards an analysis of their specific characteristics, we have only to take note of one point of difference *ex hypothesi* between renaissances and those diverse contacts in the Time-dimension that are represented by the other two varieties of the species.

In the relation of Apparentation-and-Affiliation between two living societies of different generations, as well as in a society's archaistic reversion to some phase of its own past experience, the two parties must be, *ex hypothesi*, in diverse and dissimilar stages of their life-history. In a case of Apparentation-and-Affiliation, for example,² the elder of the two parties must, not only have broken down, but have gone so far along the road of disintegration as to have split into the two factions that we have called a proletariat and a dominant minority, before the embryo of a younger civilization can be conceived in the womb of the elder civilization's proletariat; and, in consequence, the two parties to one of these encounters in the Time-dimension in which both parties are alive at the time are bound to find themselves, during the period of this encounter between them in the life, in extremely dissimilar phases of experience, at however early a stage of its growth the 'apparented' society may have broken down, and at however early a stage of its own subsequent growth the 'affiliated' society may suffer (if it does suffer) the antecedent society's fate. In a case of Archaism the *a priori* necessity of a corresponding difference between the respective psychological situations of the necromancer and the ghost of his own past self is still more obvious; for the very fact that the necromancer is recalling a past phase of his own life carries the implication that this resuscitated past and the living present represent different stages in the formation of a single cumulatively growing experience. On the other hand, when the ghost that the necromancer evokes is the ghost, not of his own, but of a different civilization, which, though 'apparented' to his own, is now no longer in the land of the living, it is equally open to him, at will, to evoke either a phase of this dead antecedent civilization's experience that is dissimilar from the necromancer's own present or a phase that is more or less on a psychological par with it.³ This wider freedom of choice, and the use that the necromancer is apt to make of it, will prove to be important themes in the study of renaissances upon which we are now embarking.

¹ See IX. viii. 101. The way of life that we have labelled 'Archaism' has been examined in V. vi. 49-97. ² See IX. viii. 97. ³ See IX. viii. 98-100, and pp. 128-37 below.

B. A SURVEY OF RENAISSANCES

(I) A PLAN OF OPERATIONS

IF we have now succeeded in establishing our thesis that a Late Medieval Italian renaissance of Hellenism which had been known as 'the Renaissance' in Modern Western parlance was, after all, not a unique phenomenon but was one representative of one species within a genus labelled 'encounters', the next step that suggests itself is to take advantage of this widening of our horizon for the prosecution of our inquiry along our customary empirical lines. Let us first see how many instances we can collect of renaissances within the meaning of the term as we have now defined it, and then let us go on to use the results of this survey as the basis for an analytical study of this species of encounter by means of the comparative method of investigation.

In setting out to plan a survey of renaissances, we shall find at once that our foregoing critique of 'the Renaissance' has already placed in our hands some clues to the discovery of a procedure. We have noticed that this Italian resuscitation of Hellenism was neither comprehensive nor indiscriminate; it was a recapture of certain particular facets of the resuscitated culture's life. A literary and an artistic facet were two aspects of this renaissance that were in the foreground of a latter-day Western observer's retrospective picture of the phenomenon, and we have also noticed a political facet that had perhaps always been paramount in fact, and that was undoubtedly the one aspect of the Italian renaissance of Hellenism which, in A.D. 1952, was showing an increasing, instead of a diminishing, potency for fascinating Western souls.¹ These three facets of this particular *revenante* culture in this particular evocation correspond to three of the elemental and sub-elemental rays into which we have found the integral radiation of a radioactive culture being diffracted in the process of diffusion in the dimension, not of Time, but of Space;² and, with this clue in our hands, we may push our search for instances of renaissances into the rest of those divers fields of human activity which have figured as separately distinguishable strips in our culture-spectrum. On these lines we shall make successive searches for symptoms of renaissances in the fields of Politics, Law, Science and Philosophy, Language and Literature, the Visual Arts, and Religion.³ Moreover, these inquiries will not be confined to renaissances of various aspects of Hellenism in the Western Christian Hellenistic World at different stages in this civilization's history. We shall also put into the witness box, one after another, all the other civilizations of the third generation that have come within our cognizance⁴—and these are all that come into question in our present inquiry, since these alone had been *en rapport* with their

¹ See p. 3, n. 1, above.

² See IX. viii. 498–500.

³ It will be noticed that Economics are absent from this list, in contrast to the importance of the part that they have proved to play in encounters in the Space-dimension between contemporaries.

⁴ A list of tertiary civilizations will be found in the table of primitive societies, civilizations, and higher religions in serial order, in VII. vii. Table IV facing p. 772.

predecessors on the comparatively intimate terms required for making the feat of evocation a possibility.

While the resuscitation of a dead culture in the heart and mind of a living society may result in the necromancer's recollecting aspects of the resuscitated culture that he has forgotten, or even in his discovering aspects of which he has never before been aware, he could never have performed the initial act of materializing the nucleus of the wraith which he has thus afterwards gradually brought into focus if, before ever he set out to raise this ghost, he had not possessed some hold over the dead society. This indispensable preliminary hold consists, as we have seen,¹ in the possession of a stock of practices and ideas derived from the dead civilization's cultural heritage; and this key is not in the hands of any civilization of a younger generation that is not affiliated to the dead society in virtue of being the issue of a chrysalis church that has been constructed by the dead society's internal proletariat. This link of Apparentation-and-Affiliation, as we have called it, duly subsists between tertiary civilizations and their secondary predecessors; but we have found no more than abortive rudiments of it in the relation between secondary civilizations and the primary predecessors of these;² and, *ex hypothesi*, there can have been no relation of this kind between those primary civilizations themselves and the primitive societies out of which they must have arisen by some process of mutation.³ On this showing, we may take it that we shall have covered the ground of our present inquiry when we have taken an inventory of the tertiary civilizations' performances in their resuscitations of facets of the lives of their secondary predecessors in the divers fields of activity that we have been able to distinguish for our present purpose.

(II) OPERATIONS ACCORDING TO PLAN

(a) RENAISSANCES OF POLITICAL IDEAS, IDEALS, AND INSTITUTIONS

We have already noticed that the Late Medieval Italian renaissance of Hellenism exerted a more enduring influence on Western life on the political plane than on either the literary or the artistic.⁴ We may now go on to observe that the political manifestations of this renaissance not only outlived the aesthetic manifestations but had forestalled them. A renaissance which did not declare itself on the aesthetic plane earlier than the generations of Dante (*vivebat* A.D. 1265-1321) and Petrarch (*vivebat* A.D. 1304-74) had begun to take effect on the political plane as early as the eleventh century, when the government of the cities of Lombardy had passed out of the control of their bishops into the hands of communes administered by boards of magistrates who were appointed by, and responsible to, the citizens. The resuscitated Hellenic political ideal which made this impact on eleventh-century Western Christian urban communities in Northern Italy⁵ proceeded, after the radiation

⁵ See p. 3, n. 1, above.

of a Late Medieval Italian sub-culture into the Transalpine and Transmarine provinces of Western Christendom, to make a corresponding impact on the peoples of the feudal monarchies which this walking ghost of Hellenism encountered there.

In both its earlier and narrower and its later and wider field the influence of this Hellenic *revenant* on Western politics was the same. The superficial effect was to propagate a cult of constitutional self-government which was eventually to confer upon itself the flattering Attic title of 'Democracy'¹ after demonstrating its potency by precipitating successively an English, an American, and a French Revolution. By the year A.D. 1871 this 'Democracy' seemed to have won a conclusive victory over a post-Alexandrine Hellenic Absolute Monarchy which had been evoked by Late Medieval Italian and Early Modern Transalpine and Transmarine Western despots as an instrument for transposing a resuscitated Hellenic style of polity from a city-state to a nation-state scale.² But a lip-service to a Humanitarianism professedly dedicated to the welfare of individual human beings glozed over a demonic idolization of a tribal Collective Humanity whose juggernaut car was to ride roughshod over the rights of children, women, and men³ when these rights were divested of their religious sanction. In a Christian society this sanction had been the sacrosanctity of each single soul in the eyes of a God who had revealed Himself to be the Father and Redeemer of every creature. In a post-Christian twentieth-century Western World a blasphemously idolatrous revival of the worship of an Athênê Poliúchus masquerading as the Goddess France and of an Athânâ Chalcioecus masquerading as the Goddess Prussia⁴ was threatening to bring down upon the heads of *ci-devant* Christian Western idolators the nemesis that had once overtaken those pre-Christian Hellenic idolators whose abomination of desolation these Hellenizing Western neo-pagans had re-erected in order to fill a desolatingly vacant place on their own swept and garnished altars.

This ghost of an idolatrous Hellenic worship of a Collective Humanity embodied in a parochial state was thus evoked in Medieval Italy some three or four hundred years earlier than the ghosts of an Hellenic literature and visual art that, in their authentic original epiphanies in the fifth and fourth centuries B.C., had been raised to their highest level of achievement by Attic worshippers of a parochial Athênê Poliúchus. This Italian renaissance of Hellenic political parochialism was not, however, either the only or the earliest political renaissance of Hellenism in Western history. In the course of Hellenic history itself, a religion of state-worship that had begun to be known by its fruits⁵ had temporarily salvaged its credit in the eyes of partially disillusioned worshippers by passing over from a pristine parochial to a latter-day oecumenical form; Athênê Poliúchus, Athânâ Chalcioecus, Tychê Antiocheôn, Fortuna Praenestina, and the other deified combatants in a *mêlée* of conflicting

⁵ Matt. vii. 20 and xii. 33; Luke vi. 44.

parochial idols had eventually been called to order by being subordinated to the oecumenical supremacy of a Dea Roma and a Divus Augustus; and a post-Diocletianic absolute version of this consolidated worship of the concentrated power of a politically unified Mankind was formally revived in Western Christendom, a quarter of a millennium before the revival of city-state-worship in Lombardy, when Charlemagne was crowned as a Roman Emperor by Pope Leo III in Saint Peter's on Christmas Day A.D. 800.¹

The memory of this Carolingian evocation of a 'holy' Roman ghost of an extinct Hellenic universal state cannot come into our minds without reminding us simultaneously that, since then, the same ghost had been re-evoked again and again in the Western World in the course of the eleven and a half centuries that had elapsed between the date of the coronation of Charlemagne at Rome and the time of the writing of these lines.

The all but fatal collapse of the nascent Western Christian Civilization itself, which had been the price of Charlemagne's failure to resuscitate the Roman Empire in the West effectively, did not deter a Saxon Otto I² from repeating his Austrasian predecessor's attempt; and the subsequent failure of Otto's attempt in its turn did not deter a Swabian Frederick I from attempting, for his part, to undo the political effects of the humiliation of a Franconian Henry IV at Hildebrand's hands by employing against a triumphant Hildebrandine Church the refurbished spiritual weapon of a recently disinterred Justinianean Law.³ Thereafter, when Frederick Barbarossa's experience had demonstrated that the necromancer's wand provided by his Bolognese legists was a broken reed, his grandson Frederick *Stupor Mundi* set himself to reverse, at the eleventh hour, the cumulative disaster of Charlemagne's, Henry IV's, and Frederick I's successive discomfitures⁴—though the weapon in which Frederick II trusted to conjure a victory out of his forlorn hope was one which had missed fire, more than two hundred years back, in the hands of his Saxon predecessor Otto III.⁵

This imaginative tenth-century forerunner of a thirteenth-century *Stupor Mundi* had sought to condense an insubstantial wraith of a defunct *Imperium Romanum* into at least a similitude of flesh and blood by transferring the seat of a rehabilitated Western Christian 'Holy Roman Empire' from Western Christendom's Saxon marches over against the North European barbarians⁶ to her Roman march over against Orthodox Christendom. At the turn of the tenth and eleventh centuries of the Christian Era the Ducatus Romanus was a patch of common ground on which the domains of the two Christendoms overlapped;⁷ and, in installing himself in the *ci-devant* Imperial City, Otto III had hoped to fortify the sickly counterfeit of the Roman Imperial Power that had been

¹ Charlemagne's attempt to revive the Roman Empire in Western Christendom has been discussed in this Study in I. i. 343; III. iii. 276; IV. iv. 378-9; V. v. 477, n. 1; and VI. vii. 19.

² See II. ii. 167-8.

³ See IV. iv. 557, and p. 31, below.

⁴ See IV. iv. 560-7; VII. vii. 537-8; and IX. viii. 394-5.

⁵ See IV. iv. 617, n. 2.

⁶ See II. ii. 167-9.

⁷ See IV. iv. 335-7, 521-2, and 599-600.

palmed off on Western Christendom by reinforcing it with tougher metal imported from a Byzantine mint. The success of Leo III Syrus's revival of the Roman Empire in Orthodox Christendom had been as conspicuous as the failure of Charlemagne's subsequent attempt to perform a corresponding feat of political necromancy in the West.¹ Could not a clumsy Western necromancer's abortive essay be salvaged by the Herodian expedient of turning to Western Christendom's account the achievements of an Orthodox Christian necromancer's virtuosity?

This complicated experiment of trying to raise the ghost of a dead civilization by employing a living civilization as a medium, which Otto III had failed to carry to success in the cultural crucible of a late-tenth-century City of Rome, was repeated by Frederick II under more promising conditions in a thirteenth-century Kingdom of Sicily which was the East Roman Empire's Transadriatic successor-state. The outcome of this more ambitious adventure in the black art of political alchemy was, as we have seen,² a war to the death between a pseudo-Byzantine 'Holy Roman Empire' and a Hildebrandine Papal Roman Church which brought the victorious ecclesiastical combatant to the ground in the same ruin as his vanquished secular adversary and thereby compromised the future of a promising Western Christian attempt to explore a previously untried approach towards the goal of the baffling enterprise of Civilization. Yet the ghost of an obsolete Hellenic institution that had been so inauspiciously raised at the close of the eighth century of the Christian Era by an Austrasian king and a Roman patriarch was still able to induce fresh Western victims to feed it with their life-blood within full view of their infatuated predecessors' unburied corpses.

By the time of the extirpation of Frederick II Hohenstaufen's brood, the cumulus of historic disasters, that had gradually come to be associated with academic pretensions to the imperial prerogative in the West, had gathered round a tragic imperial crown into a lowering nimbus which might have been expected to serve as an effective deterrent against any further repetition of Charlemagne's folly. Yet this scarecrow *Caesarea Maiestas* was eagerly appropriated by the architects of a Danubian Hapsburg Monarchy for the sake of the prestige that it could still lend to their strictly practical enterprise of providing an Early Modern Western World with a local carapace to protect it against Ottoman aggression in the Danube Basin;³ and, after the decay of the Ottoman Power had rendered a Hapsburg Empire's service to the Western Civilization superfluous,⁴ 'the Holy Roman Empire of the German Nation'—which had been preserved by the arts of Hapsburg statesmanship to weigh as an incubus on submissive German backs with a gravity that grew heavier century by century—was sedulously transferred to no-less-willing French backs by the policy of a Napoleon whose motives in thus posing as a traditionalist were the hard-headed calculations of *raison d'état*.

The immediate effect of the Corsican adventurer's usurpation of the imperial style and title in A.D. 1804 was to vulgarize a term of Western

¹ See I. i. 343; III. iii. 276; IV. iv. 378-9; V. v. 477, n. 1; and VI. vii. 19.

² In IV. iv. 560-7.

³ See II. ii. 177-9.

⁴ See II. ii. 179-90.

political art whose dignity had been the only one of its pristine virtues that had not by then long since departed from it. The reigning Danubian Hapsburg monarch Francis II's self-metamorphosis from a 'Roman Emperor' into an 'Hereditary Emperor of Austria' on the 10th August, 1804, was caricatured, on the 12th October, 1822, in the proclamation of Don Pedro I as Emperor of Brazil.¹ Yet this *reductio ad absurdum* of the value of a political coinage which a Napoleon I had debased did not deter a Napoleon III from assuming, on the 2nd December, 1852, a title that was to lure him into liquidating a Second French Empire in a more conclusive disaster than the First French Empire's débâcle. Nor did the conclusiveness of the French nation's failure in the nineteenth century to re-establish the reality of a Roman Empire on ex-Roman ground in Europe deter French imperialists from seeking a more propitious field on ex-Roman ground in North-West Africa for an experiment in political necromancy that never ceased to exact sacrifices without ever forfeiting its powers of fascination.²

Meanwhile a German nation that was taking its revenge on the Second French Empire for the sins of the First had not waited for the capitulation of a beleaguered Paris to reassume—as it did at Versailles on the 31st December, 1870—the incubus of which it had been relieved, 64 years back, by the fortuitous combined good offices of a Corsican usurper and a Hapsburg defeatist;³ and even the demonic twentieth-century Austrian improviser of a momentary Third German Reich, in whose wild eyes a Prussian essay in a Second German Reich and an Austrian epilogue to a First German Reich were both alike anathema, eventually came under the spell of the Roman Empire's still unladen ghost so far as to fly in the face of his own crazy ideology by perching his vulture's-nest on a crag overhanging an enchanted Barbarossa's holy cave at Berchtesgaden⁴ and by accepting the regalia of Charlemagne, stolen from a Hapsburg treasure-house, as a tribute from the *Statthalter* of the lethal lunatic's own *gleichgeschaltet* Austrian homeland.⁵

During the 134 years that had elapsed between the date of Hitler's indulgence in this freak of historical fancy and the date of Napoleon I's assumption of a usurped imperial diadem, the now fast-fading phantom of a Roman oecumenical autocrat's *khwarenah*,⁶ which by that time had been haunting a Western political waste-land for more than a thousand years, had been shining with too faint a flicker of light to be capable any longer of working more serious mischief than the will-o'-the-wisp's

¹ See VI. vii. 22, n. 1.

² The quest for a consolation prize in Africa to compensate for disappointments in Europe was a motive of nineteenth-century and twentieth-century French imperialism in the Maghrib that has been noticed in Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1937*, vol. i (London 1938, Milford), pp. 489–90. See also the present Study, IX. viii. 258.

³ Francis II Hapsburg had renounced the title of Holy Roman Emperor on the 6th August, 1806.

⁴ See Bryce, James: *The Holy Roman Empire*, chap. xi, *ad finem*, quoted in III. iii. 463.

⁵ The regalia of the Holy Roman Empire were presented to Hitler by Seyss-Inquart on the 6th September, 1938, at the National Socialist Party's annual rally at Nuremberg. Hitler placed these treasures in the hands of the civic authorities of Nuremberg, who had been the custodians of them before A.D. 1809.

⁶ See IX. viii. 548, n. 1.

prank of enticing fools to follow a treacherous gleam to their deaths. But this ideal of oecumenical unity which, on Western soil, had hitherto invariably proved abortive was only one aspect of the ghost of a senile Hellenic universal state that had been raised in St. Peter's by Pope Leo and King Charles on Christmas Day, A.D. 800. The absolutism of the Diocletianic Roman Empire's demands upon its subjects had been as characteristic a feature of this Late Hellenic political institution as its claim to world-wide dominion; and the intensive, as well as the extensive, potency of the original had been reproduced in the wraith that had been raised to haunt a Western Christendom.

'The Carolingian Empire . . . was conceived as the society of the whole Christian people under the control of a theocratic monarchy, and [it] attempted to regulate every detail of life and thought, down to the method of ecclesiastical chant and the rules of the Monastic Order, by legislative decrees and governmental inspection. . . . The fusion of temporal and spiritual powers was far more complete in the Carolingian State than it had been in the Christian barbarian kingdoms, or even in the Byzantine Empire.'¹

Charlemagne and his successors had condemned this resuscitated Constantinian absolutism to miscarry by attempting to bring, not only every plane of human activity, but also every geographical province of Western Christendom, under the sway of this 'unitary Church State';² but an auspicious difference in the circumstances in which the Carolingian *tour de force* was reattempted by Frederick II Hohenstaufen made it possible for Frederick's political oecumenicalism to fail as lamentably as Charlemagne's without involving his absolutism in the disaster which had overtaken both elements in the Carolingian enterprise.

When Charlemagne had ventured on his attempt to reinaugurate a Constantinian absolutism throughout his wide-spread and still fast-expanding dominions, he had had to start building up again, from the foundations, a sophisticated social structure that had long since been raised to the ground in all the former provinces of the Roman Empire that lay within his frontiers, and this perhaps the most thoroughly of all in his own ancestral patrimony, Austrasia. By contrast, the Emperor Frederick II inherited, in the Kingdom of Sicily, a base of operations in which absolutism was already a going concern, thanks to the effective local revival there of a Late Roman dispensation by the efficient hands of his father's Norman victims' Byzantine and Muslim predecessors.³ And, although the difference in degree of political efficiency between a thirteenth-century Sicily and an eighth-century Austrasia proved not to be great enough—vast though it was—to compensate for Frederick II's handicap in entering the lists so late in the day, the consequent failure of his attempt to unite Central and Northern Italy with Southern Italy and Sicily under a centralized oecumenical autocratic rule did not prevent him from making, as King of Sicily, the mark on Western history that he found himself impotent to make as Holy Roman Emperor. In other

² Dawson, op. cit., p. 89.

³ See IX. viii. 394-5.

contexts¹ we have already observed that the effective local revival of a Late Roman absolutism in the Kingdom of Sicily, which did not avail in Frederick II's lifetime to serve the King-Emperor as an instrument for making the same resuscitated absolutism likewise effective on an oecumenical scale, did stimulate a host of Late Medieval and Early Modern Western parochial diadochi and epigoni of the *Stupor Mundi* to honour his memory by taking his autocracy as their ensample on the less ambitious Siculo-Neapolitan geographical scale on which it had achieved so brilliant a success.

The earliest of these successful experiments in establishing counterparts of a Byzantine Kingdom of Sicily in other provinces of Western Christendom were the work of despots who, in the course of the quarter of a millennium following Frederick's death in A.D. 1250, swept up the seventy or eighty self-governing city-states of Central and Northern Italy into not more than ten miniature empires that were, all of them, faithful reproductions of their Sicilian prototype in proving to be so many local graves of Medieval Italian civic liberties.² This local Sicilian culture of an antediluvian weed which had thus been bedded out in Late Medieval North Italian nursery gardens³ was one of the principal Italian exports to the Transmarine and Transalpine parts of Western Christendom in the diffusion of the Late Medieval Italian sub-civilization at the turn of the fifteenth and sixteenth centuries; and in this wider field the propagators of an inauspiciously resuscitated Late Hellenic autocracy did not have to reperform their North Italian instructors' arduous task of fencing in new political enclosures for the cultivation of the exotic plant of absolutism. Beyond the Alps and the Tyrrhene Sea the North Italian cuttings of a Late Hellenic poison-ivy that had been successfully recultivated in Sicily found ready-made garden-beds in the existing feudal kingdoms and principalities; and in another context⁴ we have seen how, under the impact of this imported autocracy, the medieval parliamentary liberties of the non-Italian parts of Western Christendom came within an ace of suffering the fate that had already overtaken the medieval civic liberties of Italy.

In the ex-feudal Kingdom of England alone the challenge presented to an indigenous medieval parliamentarism by the infiltration of an exotic Italianate autocracy was successfully met by a marriage between parliamentary liberties and autocratic efficiency which bore fruit in the creation of a Late Modern Western form of parliamentary constitutional government. This was, however, merely a local exception to the general

¹ In VII. vii. 537-8 and IX. viii. 363 and 394-5.

² See III. iii. 354-6 and IV. iv. 353, n. 2. In Southern Italy these civic liberties had been extinguished some two hundred years earlier by Norman pupils of Byzantine avatars of Roman Justinians and Diocletians. The civic liberties of the once self-governing city-states of Northern and Central Italy were extinguished—with the two notable exceptions of Venice and Genoa—as effectively when, like Milan and Florence, they became capitals of miniature empires as when, like Pavia and Siena, they became provincial towns; and, though the yoke of political subjection might weigh less heavily on the necks of *ci-devant* city-states which, like Padua and Verona, had lost their independence to a tyrant city and not to a tyrant dictator, dynasty, or Papal Crown, the cities that became subject to Venice did lose their independence no less decisively than their sisters that became subject to the Papal Monarchy, the Medici, and the Visconti.

³ See I. i. 19.

⁴ In III. iii. 358-63.

course of political development in Western Christendom in its Early Modern Age. In the Western World of that age, outside England, the stalking spectre of a reanimated Diocletianic Roman absolutism won a sweeping victory; and, though all victories are wasting assets, it took two hundred years for the tyranny of a Philip II (*regnabat* A.D. 1555-98) to refine itself into the 'enlightened' absolutism of a Joseph (*imperabat* A.D. 1765-90), and three centuries for 'the divine right' of kings, who had converted their limited hereditary feudal rights into an unlimited adventitious Justinianean prerogative, to water itself down into the prosaic 'legitimacy' pleaded by the shell-shocked beneficiaries of a brief post-Napoleonic Restoration.

The kings crept out—the peoples sat at home,
And finding the long-invoked peace
(A pall embroidered with worn images
Of rights divine) too scant to cover doom
Such as they suffered, cursed the corn that grew
Rankly, to bitter bread, on Waterloo.¹

Yet, even after the judgement passed by 'the Ideas of 1789' on a Modern Western ghost of a Late Hellenic absolutism had been executed in the French Revolution's mid-nineteenth-century aftermath (*metabatur* A.D. 1848-71), a vestige of autocracy still survived in the Western World in the Hapsburg government of Austria-Hungary and the Hohenzollern government of Prussia-Germany; and, even when these now patently anachronistic vestigial autocracies were tardily overthrown as a consequence of their defeat in the War of A.D. 1914-18, the sequel was to disappoint President Wilson's sanguine endeavour to 'make the World safe for Democracy';² for, when the ghost of a resuscitated Justinian, that had still been haunting the politically backward eastern marches of a now almost ubiquitous Western Civilization, had thus at last been laid, the victorious 'Anglo-Saxon' institution of responsible parliamentary representative government did not succeed to the exorcised Hapsburg and Hohenzollern Caesars' vacant heritage. In this hour of supreme opportunity an English-grown parliamentarism proved to be a tender plant, which might bear admirable fruits on its native soil in England and her daughter commonwealths founded by English settlers overseas, but which was apt to wilt under the ordeal of transplantation to non-Anglo-Saxon Western ground.

The anti-parliamentarian denouement in Central Europe in the inter-war years A.D. 1919-39 gave 'Anglo-Saxon' votaries of Parliamentarism a shocking surprise; yet the replacement of an overthrown Justinianean 'legitimacy' by a dynamically militarist-minded Agathoclean tyranny, which was the sign of these unhappy inter-war times, had been foreshadowed, long since, in Napoleon I's exploitation of 'the Ideas of 1789' and in Napoleon III's occupation of the vacuum left by the fall of Louis Philippe's constitutional monarchy; and on the morrow of a Second

¹ Browning, E. B.: *Crowned and Buried*, Stanza xii.

² 'The World must be made safe for Democracy'—President Wilson in his Address to the Congress of the United States on the 2nd April, 1917, calling for a declaration of war against Germany.

World War it was no longer possible for Western Liberals to blind their eyes to the truth that, after all, the ghost of a resuscitated Hellenic absolutism had not been laid in Western Christendom effectually. It had no sooner been banned in one epiphany than it had reasserted itself in another; and this second visitation of an unquiet spirit was more disturbing than the first, since the demonic powers latent in Human Nature, which, in the economy of an absolute monarchy, were let loose in one lost soul alone, were 'activated' *viritim* in the eruption of a 'totalitarian' democracy that was a veritable dictatorship of Leviathan.

This Frankenstein's monster was the latest product of a *karma* from which Western Man had never succeeded in releasing himself since he had wantonly incurred it, on Christmas Day A.D. 800, by raising the ghost of an antecedent society's universal state. We may now go on to remind ourselves that this particular exhibition of the necromancer's craft on the political plane was no monopoly of the Western practitioners of the Black Art.

A ghost of a Roman Empire that had served as the Hellenic Society's universal state was raised by an Orthodox as well as by a Western Christian Hellenistic Society; and we have seen¹ that in Orthodox Christendom this necromantic *tour de force* was performed with such virtuosity that the incubus of the East Roman Empire proved heavy enough to break the Orthodox Christian Society's back in the reign of the Emperor Basil the Bulgar-killer (*imperabat* A.D. 969-1025), little more than 250 years after the local evocation of the ghost of Roman imperialism by Leo Syrus (*imperabat* A.D. 717-41). We have likewise seen² that neither the disastrous aftermath of the Great Romano-Bulgarian War of A.D. 977-1019 nor the submergence of a surviving remnant of Orthodox Christendom in Western Anatolia, which was the promptly exacted price of the re-erection of a simulacrum of the East Roman Empire at Constantinople in A.D. 1261, nor even the capture of the vampire Imperial City in A.D. 1453 by the 'Osmanlis, made a sufficient impression on the Greeks to break the spell of their infatuation with the ghost of an Hellenic universal state which had been exacting from them these ghastly sacrifices. They required the crowning catastrophe of A.D. 1922, in which the submerged Orthodox Christian diasporà in Anatolia was exterminated, to rid them of 'the Great Idea' of crushing themselves to death for the third time in Orthodox Christian history by once again saddling themselves with a resuscitated Roman Empire.

We have also watched the ghosts of other universal states playing the malignant role played by the Hellenic universal state's ghost in the histories of the two Christian Hellenistic civilizations. The ghost of a Syriac universal state that had eventually been embodied in the 'Abbasid Caliphate was raised at Cairo³ after the fall of Baghdad in A.D. 1258, and was translated to Constantinople, after the fall of Cairo in A.D. 1517, to ride there malignly on the shoulders of 'Osmanlis who had inadvertently acquired this political incubus among the spoils of their victory

¹ In I. i. 64, n. 3, 65, 66, and 70; IV. iv. 320; VI. vii. 19; and IX. viii. 103.

² In VI. vii. 29-31.

³ See I. i. 67, n. 2, 70, 360, and 396; II. ii. 75-76; and VI. vii. 21.

over the Mamlūks.¹ The ghost of a Sinic universal state that had been embodied in the Ts'in and Han Empire² returned to haunt an affiliated Far Eastern Society in the shape of the Sui and T'ang Empire;³ and, when the main body of the Far Eastern Society propagated an offshoot on to Japanese soil, this Sinic political incubus was exported to Yamato in A.D. 645 as an indispensable piece in the conventional suite of contemporary Chinese cultural furniture, to play a weird role in its doubly exotic new environment overseas.⁴

In the analogous propagation of an offshoot of Orthodox Christendom on to Russian soil at the turn of the tenth and eleventh centuries of the Christian Era, the converted Varangian war-lords' Scandinavian mother wit or heaven-sent good fortune preserved them from committing the political solecism of dressing themselves up in a re-conditioned Roman Imperial *skaramangion* which had been transmuted on eighth-century Greek shoulders from a silken robe into a leaden cope, and on tenth-century Bulgar shoulders from a leaden cope into a corrosive shirt of Nessus. Yet the Russian offshoot of Orthodox Christendom proved, after all, unable in the long run to escape its fate of having to take delivery of an Hellenic political incubus which had become the characteristic peculiar institution of the Orthodox Christian way of life since the evocation of this ghost by Leo Syrus's necromantic genius. The Muscovite epigoni of Rurik, who provided a broken-down Russian Orthodox Christendom with its universal state,⁵ won for themselves the dubious privilege of catering for this now necessary social service by equipping themselves with the redoubtable apparatus of an autocracy that consecrated its home-grown institutions by dedicating them to a Byzantine ideal. The formidable mission of casting herself for the role of a Third Rome was the price at which Moscow purchased from malicious gods her licence to monopolize the grim business of empire-building on Russian ground.⁶

Our survey up to this point has made it evident that, in the histories of civilizations of the third generation, a renaissance of the universal state of an antecedent civilization has been a not uncommon event. Indeed, among all the civilizations of this third generation that were not abortive, the Hindu Civilization is perhaps the only one in whose history we do not find this particular institution re-emerging from the psychic storeroom of the affiliated society's memory of the apparented society's life and works; for, in the history of the Iranic Muslim Civilization, we can perhaps detect in Timur Lenk's warped empire-building activities a belated and abortive attempt at a revival of the antecedent Syriac Society's universal state if we follow up the clue offered to us by the resemblances between Timur's career and Charlemagne's.⁷ If Timur's demonic temperament had not carried him to fatally farther lengths

¹ See VI. vii. 21-27.

² Points of likeness and difference between the renaissances of the Sinic and Hellenic universal states are examined on pp. 649-81, below.

⁷ See IV. iv. 488-504.

than Charlemagne's limit in committing the marchman's besetting sin of turning his arms against the interior of the world which it is his historical mission to defend, it is conceivable that the Transoxanian empire-builder might have emulated the achievement of his Austrasian counterpart, who raised a ghost of the Roman Empire in Western Christendom, by raising a ghost of the 'Abbasid Caliphate on Iranic Muslim ground—though we may also surmise that, even if Timur had achieved the utmost success within his power in this enterprise, the contrast between a Timurid caricature of the Baghdādī 'Abbasid Caliphate at Samarqand and a contemporary 'Abbasid reproduction of the Baghdādī 'Abbasid Caliphate at Cairo would have been even greater than the historic contrast between Charlemagne's caricature and Leo Syrus's reproduction of the Roman Empire.

In every instance of either an effectual or an abortive evocation of an antecedent civilization's universal state that we have examined up to this point, the society whose life this *revenant* has haunted has been linked through a chrysalis-church¹ with the society out of whose ashes the spectre has been conjured up. Is a chrysalis-church an indispensable officiant in the rite whereby this feat of evocation is accomplished? Or are there cases in which the ghost of an antecedent civilization's universal state has been evoked by a civilization which has been linked with its predecessor, not through a chrysalis-church constructed by the predecessor's internal proletariat, but through the predecessor's external proletariat or its dominant minority?² The answers to these questions likewise may prove to be indicated by the Carolingian clue which has just enabled us to detect an abortive evocation of a ghost of the 'Abbasid Caliphate on Iranic Muslim ground by Timur Lenk; for, in the early histories of at least three secondary civilizations derived from primary predecessors through these predecessors' external proletariats, we find polities that bear a closer apparent family likeness to Charlemagne's empire than Timur's empire displays. The polities in question are the Ch'ou Empire in Sinic history,³ the Khatti Empire in Hittite history, and the Toltec Empire in Mexic history.⁴

All these three empires resemble the Carolingian Empire in being products of barbarian interlopers who had established themselves within the former frontiers of the universal state of an antecedent civilization. All three empires also resemble the Carolingian Empire in the further point of having their political centre of gravity in regions which, in the geography of the antecedent civilization and its universal state, had

¹ This conception of the role of churches in the histories of civilizations has been examined in VII. vii. 392-419.

² Our classification of societies in which these distinctions are drawn is set out in the table IV in vol. vii, facing p. 772.

³ In the tables in vol. i, pp. 131-3 and 186, the Sinic Society has been wrongly classified as a primary civilization, in contradiction to the Sinic Society's own tradition that the Ch'ou culture was a secondary one which had been preceded by that of the Shang (*alias* Yin). Since the publication of the first three volumes of this Study in A.D. 1934, the Sinic Society's tradition about its own antecedents had been confirmed by the progress of archaeological discovery (see VI. vii. 213, n. 1).

⁴ For the Toltec Empire, see Gann, Th.: *Mexico from the Earliest Times to the Conquest* (London 1936, Lovat Dickson), pp. 34-50; Vaillant, G. C.: *The Aztecs of Mexico* (London 1950, Penguin), pp. 65-82.

been, not central, but peripheral. The geographical situation of Charlemagne's Austrasia in what had been the Rhenish march of the Roman Empire has manifest parallels in the geographical situations of these other three empires' nuclei. The Chóu Dynasty's original patrimony lay in the Wei Basin, which had been the western marchland of the Shang culture and which was to continue to play the same role in the successive histories of the Sinic and the Far Eastern Civilization.¹ The Khatti Empire's metropolitan territory lay in the former western marchland of a Sumeric universal state on the eastern fringe of the Anatolian Plateau. The Toltec Empire's capital city, Tula, lay in the former north-western hinterland of 'the First Empire' of the Mayas on the south-eastern fringe of the Mexican Plateau.

The four empires that we are comparing bear a further and more intimate resemblance to one another in being, all alike, feudal in their organization. All four were loose and unstable associations of divers peoples constituting so many separate principalities or kingdoms that were held together precariously under the never quite unchallenged overlordship of one of their number.² This ramshackle constitution was a birth-mark that was also a death-warrant; and the slow agony of the Holy Roman Empire's decline and fall, in the course of the 1,005 years and seven and a half months intervening between Charlemagne's coronation at Rome on Christmas Day A.D. 800 and Francis II's abdication at Vienna on the 6th August, 1806, has a striking parallel in Sinic history in the eight or nine hundred years³ long *dégringolade* of a Chóu Empire which received its Napoleonic *coup de grâce* in 249 B.C. at the brutal hands of the revolutionary militarist principality of Ts'in. The ninth-century collapse of the Carolingians, the eleventh-century humiliation of the Carolingians' Franconian successors by Pope Gregory VII, and the thirteenth-century overthrow of the Hohenstaufen by Pope Innocent IV, are milestones on a leisurely yet unswerving road to ruin that have their counterparts in the history of the Chóu in the successive catastrophes of 841 and 771-0 B.C.⁴

The four-hundred-years-long history of the Khatti Empire was chequered by a corresponding series of collapses and recoveries ending in the final cataclysm in the first decade of the twelfth century B.C. Though the progress of Modern Western archaeological discovery in South-West Asia during the second quarter of the twentieth century of the Christian Era had brought to light evidence indicating that a supposed blank interval of 150 or 200 years between the fall of the First Empire of Khatti and the rise of the Second Empire⁵ was the figment of

¹ See VI. vii. 212, n. 4.

² For the structure of the Toltec Empire, see Gann, op. cit., pp. 35-36 and 44. The similarity in point of structure between the Chóu Empire and the Carolingian Empire leaps to the eye when the map on p. 13 in A. Herrmann's *Historical and Commercial Atlas of China* (Cambridge, Mass. 1935, Harvard University Press) is placed side by side with Maps No. 29 and No. 30 in K. von Spruner's and Th. Menke's *Hand-Atlas für die Geschichte des Mittelalters und der Neueren Zeit* (Gotha 1880, Perthes).

³ Our estimate of the Chóu Empire's duration will differ according to whether we follow the Sinic official tradition in accepting 1122 B.C. as the date of the Chóu Dynasty's overthrow of the Shang, or whether we adopt the shorter chronology which dates this revolution *circa* 1050 B.C. (see VI. vii. 212, n. 4).

⁴ See *ibid.*

⁵ See I. i. 111.

an erroneous chronology,¹ this excision of an imaginary dark age did not invalidate the evidence indicating a break in the continuity of Hittite political history between the reign of a Telepinu who was the last emperor of the first line and the reign of a Tutkhaliya who was the first emperor of the second line—even though the time-interval between these two reigns had to be estimated, on a revised chronological reckoning, in terms of months or years instead of generations or centuries. Nor did the New Empire, once established, run its 250 years' course from the later decades of the fifteenth century to the first decade of the twelfth century without at least one muffled jolt; for the account, in the imperial archives at Boghazqal'eh, of the solution of an admittedly acute political crisis in the first decade of the fourteenth century through the association of Suppiluliuma on the imperial throne side by side with his 'father' Tutkhaliya the Weakling reads suspiciously like a notification, in the bland language of official historiography, of a change of dynasty² that would be a counterpart in Hittite history of the replacement of the Merovingians by the Carolingians in the discreetly managed Frankish dynastic revolution of A.D. 751.

These manifold and remarkable points of likeness between the Khatti, Toltec, and Chóu Empires and the Carolingian Empire lead a student of history to wonder whether they may not be due, at least in part, to some common element in the four empires' respective origins. The Chóu Empire actually represented itself as being what the Carolingian Empire likewise avowedly was; for the Chóu Empire professed to be a revival of an antecedent Shang Empire at the hands of the barbarian invaders by whom the Shang had been overthrown. This Sinic claim was duly vindicated by the progress of archaeological discovery after it had been contested at the tribunal of an arrogantly hypercritical school of latter-day Western historians; and these notoriously captious critics had never denied that the rise of the Khatti Empire had been preceded by the fall of an Empire of Sumer and Akkad which we have identified as being the Sumeric Civilization's universal state, or that an 'Old Empire' of the Mayas, which we have identified as being the Mayan universal state, had come and gone before the rise of the Empire of the Toltecs. On this showing, was it too rash a conjecture to surmise that the Toltec and Khatti Empires were not merely sequels to the Mayan and Sumerio-Akkadian Empires in the bare chronological sense, but were also deliberate attempts—such as the Chóu and Carolingian Empires were known to have been—to bring these dead predecessors back to life by a feat of necromancy?

Our survey of renaissances of political ideas, ideals, and institutions would be incomplete if we were to confine it to the foregoing consideration of diverse types of polity. This would leave still unexplained, for example, the striking contrast between the incompetence that is a common characteristic of the Chóu Empire, the Khatti Empire, and the

¹ See the Note on Chronology in vol. x, on pp. 171-212.

Carolingian Empire and the efficiency that is a no less patent common characteristic of the T'ang Empire and the East Roman Empire. The reason why we find our array of ghosts of universal states thus sorting itself out into two conspicuously diverse types does not become apparent until we go on to observe that the political necromancers who conjured up the T'ang Empire and the East Roman Empire were not content simply to revive the styles, titles, and pretensions of the defunct universal states that they were seeking to bring back to life. In both cases they went on to give substance to these resuscitated forms by recreating the classically educated lay professional civil service which had been the life and soul of the Han Empire and the Roman Empire when these universal states had been present on Earth in the flesh.

These evocations of a ghost of the Roman imperial civil service in the East Roman Empire in and after A.D. 864¹ and a ghost of the Han imperial civil service in the T'ang Empire in and after the reign of T'ai Tsung (*imperabat* A.D. 627-49)² have already been noticed in other contexts, and in this place we have merely to observe that this renaissance of a vital human instrument of imperial administration accounts satisfactorily for the solidity which so impressively distinguishes the T'ang and the East Roman body politic³ from the general ruck of walking ghosts of universal states.⁴ We may go on to observe that the Carolingian Empire attempted, without success, to fortify itself by the less laborious expedient of investing itself with a religious sanction, symbolized in the revival of a rite which was familiar to Early Western Christian minds, more than thirteen centuries after this rite had been put out of action as a consequence of the successive falls of the Kingdoms of Israel and Judah, because the memory of it had been preserved in historical records that had come to rank among the Holy Scriptures of the Christian Church before the Church had become a chrysalis for the incubation of a nascent Western Christendom out of the mortal coils of a dead Hellenic World.

The religious sanction given to the formal revival of the Roman Empire in the West on Christmas Day, A.D. 800, when a Frankish king was created Roman Emperor in virtue of being crowned by the Pope, had no precedent in the unconstitutional history of the authentic Roman Empire, in which the Caesar-making proxy of an impotent Roman Senate and People had been, not the Clergy, but the Army.⁵ The

¹ See IV. iv. 345, with nn. 2, 3, and 4.

² See VI. vii. 357, n. 4, 365, n. 4, 369, and 370-2.

³ In previous examinations of the genesis of the East Roman Empire we have already noticed the incentive that moved its architects first to raise a defunct Roman Empire from the dead and then to clothe this phantom in flesh and blood by recreating the Roman imperial civil service. These successive feats of necromancy were Orthodox Christendom's responses to the challenge of being bombarded at point-blank range by the explosive militancy of the Primitive Muslim Arabs (see II. ii. 369 and 384-5, and IV. iv. 323).

⁴ The historical problem raised by the still more massive solidity of 'the Old Kingdom' of Egypt is discussed on pp. 682-92, below.

⁵ The religious sanction that was not only explicit but was also all-important in the consecration of Charlemagne and his successors as Holy Roman Emperors in the West had been foreshadowed, however, in the political ideology of a Later Roman Empire when the abuse of the Caesar-making power by the soldiers during a century of anarchy (*saevebat* A.D. 193-284) had revealed the full measure of the soldiers' contempt for a

ceremony performed on the 25th December, 800, at Rome had, however, a pertinent precedent in a ceremony performed at Soissons in or about November, 751,¹ when the Austrasian major-domo Pepin had been created King of the Franks in virtue of being crowned and anointed by Pope Zacharias' representative Saint Boniface, and this consecration of Pepin, which had been recelebrated by Pope Stephen II in person at Saint Denis on the 28th July,² 754, was a Western Christian rite—already customary by that time in Visigothia—which was the revival of an Israelite institution commemorated in the Books of Samuel and Kings.

'There can be no question that its ultimate origin is to be found in the Old Testament, where it embodies the theocratic principle and the dependence of the secular power on the spiritual power of the prophet, as we see in the case of Samuel anointing David in place of Saul,³ and in the even more dramatic story of Eliseus's [Elisha's] mission to anoint Jehu as king to destroy the house of Ahab.⁴ In both of these cases the prophet as the representative of God intervenes to change the course of History by transferring the kingship to a new line, and we can hardly doubt that these precedents were in the minds of the Pope and Saint Boniface and the advisers of King Pepin when the new rite was introduced.'⁵

This Western Christian renaissance of an Israelite institution did not avail to give the Carolingian Empire the durability of its more solidly constructed East Roman counterpart and rival, but the unavailing resuscitated Syriac rite was nevertheless to play an historic part in the Western World's political life.

'Henceforward it was to be a characteristic feature of Western kingship, so that the chrism or oil of consecration was held to confer a new sacred character on the person of the ruler. . . . The evolution of the English coronation rite takes us back with hardly any serious gaps to its Carolingian origins.'⁶

(b) RENAISSANCES OF SYSTEMS OF LAW

In proceeding with our survey of renaissances in divers fields of activity, we may now pass on from the province of political ideas, ideals, and institutions to the province of Law, in which the realities of ordinary life are reflected more faithfully than they are in Politics.

living god who was their own creature. This fearful experience had given birth to the idea that a divine ruler whose divinity could be liquidated by killing its human incarnation was more vulnerable than a ruler who did not profess to be more than a mortal himself, but who did claim to be the chosen instrument and protégé of a god whom the soldiers could neither assassinate nor intimidate, because this divine patron of a human ruler who was His vicegerent on Earth was Himself invisible and intangible. 'Aurelian . . . used to say that the soldiers deceived themselves in supposing that the destinies of the Emperors lay in their hands. For he used to aver that it was God who had bestowed the purple and . . . had decided the period of his reign' (*Auctor Anonymus post Dionem*, quoted in V. v. 649, n. 4).

¹ See Hodgkin, *Th.: Italy and her Invaders*, vol. vii (Oxford 1899, Clarendon Press), p. 134, n. 2.

² Doubt is cast upon this date by Hodgkin, *ibid.*, pp. 230-1; but it rests on the authority of an abbot of Saint Denis—the scene of the ceremony—who died only sixty years after the event.

⁶ Dawson, *op. cit.*, pp. 85 and 92.

We have seen that, after a post-Hellenic interregnum had declared itself on the political plane in the break-up of a unitary Roman Empire into a mosaic of indigenous and barbarian successor-states, the emergence of two new Hellenistic Christian civilizations found its political expression in attempts to raise the Roman Empire from the dead.¹ On the legal plane, as we have also noticed already in other contexts, a Roman Law, which, in the course of ten centuries ending in Justinian's generation, had been slowly and laboriously elaborated to meet the complicated requirements of a sophisticated oecumenical Hellenic Society,² was swiftly left stranded³—and this in the comparatively robust Centre and East, as well as in the sickly West, of a collapsing Hellenic World—by the rapid obsolescence of the whole way of life to which the Roman Law had come to be so nicely geared. Thereafter, the symptoms of decay and death were followed in due course by manifestations of fresh life on the legal, as on the political, plane; but, in a nascent Orthodox Christendom and a nascent Western Christendom alike, the impulse to provide a live law for a living society did not find its first vent in any move to reanimate a Roman Law that, in the eighth century of the Christian Era, was sitting perched, far above contemporary heads, on a pinnacle of the mighty mausoleum of an extinct Hellenic culture, like Noah's Ark when the subsidence of the Flood had left that now superfluous house-boat high and dry on the inaccessible summit of Mount Ararat. In the legal sphere the first move in both these new worlds was, not to raise a ghost, but to perform an act of creation. Each of these two Christian societies demonstrated the sincerity of its belief in a Christian dispensation by attempting to create a Christian Law for a would-be Christian people. In both Christendoms, however, this new departure in a would-be Christian direction was followed by a renaissance, first of the Israelitish law that was latent in Christianity's Scriptural heritage from Jewry, and then of a Justinianean Law which floated clear again when the level at which it had been stranded was reached by these resurgent civilizations' rising waters.

In Orthodox Christendom the Christian new departure was announced, in the joint reign of the two Syrian founders of the East Roman Empire, Leo III and his son Constantine V, in the promulgation, in March, A.D. 740,⁴ of 'a Christian law book' which was 'a deliberate attempt to change the legal system of the Empire by an application of Christian principles'.⁵ This revolutionary work was published under the conservative title of 'A Selection (ἐκλογή), in Abridgment, of the Institutes, Digest, Code, and Novels of the Great Justinian'; but its two imperial promulgators showed their hand and gave notice of their aspirations by adding in the same breath that the work was 'also a Rectification in the Direction of Greater Humanity (καὶ ἐπιδιόρθωσις εἰς τὸ φιλανθρωπότερον)'; and, in the first paragraph of the preface, the

⁵ Bury, J. B., in his edition of Edward Gibbon: *The History of the Decline and Fall of the Roman Empire*, Editio Minor, vol. v (London 1901, Methuen), Appendix 11, p. 526.

² See VI. vii. 265-8.

source of law was declared to be (not legislation enacted by the Roman People but) revelation vouchsafed by God, and the sanction of law to be (not human enforcement but) divine retribution.

'Our God who is the lord and maker of all things, the creator of Man who has endowed Man with the privilege of free will, has (in the language of prophecy) given Man, to help him, a law in which God has made known to Man everything that Man ought to do and to shun. The conduct prescribed by the law is to be adopted because it is a passport to salvation (*ὡς σωτηρίας ὄντα πρόξενον*); the conduct prohibited by the law is to be eschewed because it brings punishment on the transgressor. No one who keeps these commandments or who—save the mark—disregards them will fail to receive the appropriate recompense for his deeds of whatever character. For it is God who has proclaimed both the positive and the negative commandments in advance [of the human legislator]; and the power of God's words—a power that knows no variation and that rewards every man's works according to their deserts—shall (in gospel language) not pass away.'

This passage and its sequel drew the following pertinent comment from a Modern Western historian who was equally conversant with an East Roman and an Hellenic mental environment:

'What especially strikes one who is accustomed to the language of Gaius or Tribonian is the ecclesiastical note which characterises both the preface and other parts of the *Ecloga*. The point of view of the old Roman jurists had been almost completely lost, and the spirit of Roman Law had been transformed in the religious atmosphere of Christendom. Men tried now to base jurisdiction on Revelation, and to justify laws by verses of Scripture.'¹

A Modern Western student of the *Ecloga*, if asked how far, in his opinion, its authors were justified in their claim to have humanized the Justinianean Law, would perhaps place his finger first on the mitigation, here at last, of the barbaric native Roman institution of the *Patria Potestas*,² after this enormity had successfully resisted all the expurgatory efforts of cultivated jurisconsults, steeped in the humane atmosphere of the Hellenic schools of philosophy, who had laboured, over a span of four centuries or more ending in the Severan Age,³ to render an archaic Roman Law worthy of a post-Alexandrine Hellenic Civilization that had been constrained to receive this antiquated legal dispensation as

¹ Bury, J. B.: *A History of the Later Roman Empire from Arcadius to Irene* (395 A.D. to 800 A.D.), 1st ed. (London 1889, Macmillan, 2 vols.), vol. ii, p. 414.

² 'The *Patria Potestas* still holds an important place in the Justinianean Law, although the rights which it gave the father over the children were small indeed compared with the absolute control which had been enjoyed in ancient times. The tendency was to diminish these rights and to modify the stern conception of *Patria Potestas* by substituting the conception of a more paternalistic and less absolute authority (promoted by Christianity) in its place. The two most important points in the later transformation of the *Patria Potestas* were (1) its conversion into a parental *potestas*, the mother being recognized as having the same rights and duties as the father (thus her consent, as well as the father's, is necessary for the contraction of a marriage), and (2) the increased facilities for emancipation when the child came to years of discretion; emancipation seems to have been effected by the act of setting up a separate establishment. These principles were established by the Iconoclasts' (Bury, J. B., Appendix 11 to his minor edition of Gibbon's History, vol. v, p. 528).

³ See VI. vii. 262-3 and 265-8.

a consequence of Rome's conquest of the Hellenic World. If asked, next, which was the chapter in which the influence of Christianity on the *Ecloga* was most conspicuous, the Modern Western student would assuredly have singled out the chapter on Marriage; for in this field the fundamental principles of the Roman Law, which, 'as accepted and interpreted by Justinian, laid down that no bond between human beings was indissoluble, and that separation of husband and wife was a private act, requiring no judicial permission',¹ were overridden in the *Ecloga* by provisions embodying the irreconcilably different Christian view² that marriage was a partnership for life and that to remarry after being divorced was to commit adultery.³ These would not, however, have been the answers that the same two questions would have been likely to receive from Orthodox Christians, either jurists or laymen, in any

¹ Bury, Appendix, p. 527.

² The 'lofty conception of family life' (Collinet, op. cit., p. 709), which the authors of the *Ecloga* had imbibed from Christianity, had, of course, been derived by the Christian Church from a Jewry that had been its matrix. The very passage in the Gospels (Matt. xix. 3-9; Mark x. 2-9) criticizing the facility with which a husband could divorce his wife according to the provisions of the Deuteronomic Code (Deut. xxiv. 1) was an echo of domestic controversies within the bosom of a Jewry which had morally outgrown the Deuteronomic dispensation by the beginning of the Christian Era. This high standard in the sphere of family relations had been one of the most striking features by which the social life of the Jews in the diaspora had been distinguished, to its credit, from the contemporary life of a post-Alexandrine Hellenic Society in which the Jews had come to be dispersed abroad, and from which the vast majority of the converts to Christianity had subsequently been drawn. The fifth and seventh chapters of Saint Paul's First Epistle to the Corinthians bear witness to the difficulty of inducing Hellene Gentile Christians to rise, in this sphere, to contemporary Jewish standards. These standards were learnt from Judaism by Christianity at first hand, in the generation of the first Hellenic Gentile converts; and later generations of Gentile Christians, who might have been loath in any case to recognize that a Christian virtue had a Jewish origin, were the more easily able to forget their ethical debt to Jewry in the sphere of family relations because, in the canon of Scripture which the Church had taken over from Jewry as Christianity's 'Old Testament', the principles and practice of a post-Exilic Judaism in this province of life figured far less prominently than the luxuriant polygamy that had been the rule among the Israelite ancestors in their heroic age in the days of the dissolution of 'the New Empire' of Egypt and the founding of the Minoan World.

It was left for the Latter-day Saints of the Mormon Church and other nineteenth-century sects of Protestant Christian origin in the New World to carry their Bibliolatry to the point of making a law unto themselves out of the polygamy of the Hebrew Patriarchs as portrayed in the Book of Genesis. These un-ironic-minded 'Bible Christians' do not seem to have taken cognisance of the significant historical fact that the particular Biblical way of family life to which they were piously harking back had by this date been eschewed by the Jews for twenty-four Post-Exilic centuries, at the shortest reckoning.

The tale of centuries would be twenty-five if it could be accepted as an established finding of Modern Western scholarship that a passage in 2 Kings (xxii. 3-xxiii. 25) is to be interpreted as implying that the Book of Deuteronomy was promulgated, under show of being rediscovered, in a Pre-Exilic Kingdom of Judah in the eighteenth year of the reign of King Josiah, i.e. in the year 621 B.C. (see Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), pp. 39-40); for a comparison of the stipulation in the Book of Deuteronomy, xvii. 17—'Neither shall he [the King] multiply wives to himself, that his heart turn not away; neither shall he greatly multiply to himself silver and gold'—with the account, in 1 Kings xi. 1-8, of the luxuriant idolatry into which King Solomon had been led astray by his luxuriant polygamy, indicates that, between Solomon's day and Josiah's, a Solomonian polygamy, which had been as costly to the Israelite tax-payer as its religious sequel had been abominable in the sight of the strict worshipper of Yahweh, had produced in Judah a disapproval of polygamy in high places which was bound after, if not before, the fall of the monarchy to broaden into a disapproval of polygamy in itself.

³ 'The influence of the ecclesiastical view of Marriage as a *consortium vitae* can be seen too in the treatment of the property of the married partners' (Bury, *ibid.*; cp. Collinet, in op. cit., p. 709).

generation from the age of the authors of the *Ecloga* themselves down to the time of writing. Orthodox Christians, if thus interrogated, would have been apt to answer that the most humane and, on this evidence, the most Christian, chapter of the *Ecloga* was Chapter Seventeen, which lays down the penalties for crimes.

"The tendency of the *Ecloga* was to avoid capital punishment as far as possible. . . . Its distinguishing feature is the use of mutilation as a mode of punishment¹—a penalty unknown in Roman Law. . . . Since mutilation was generally ordained in cases where the penalty had formerly been death, the law-givers could certainly claim that their code was more lenient. . . . [But] we may question whether this tendency was due so much to the growth of feelings of humanity as to ecclesiastical motives, namely the active maintenance of the asylum privileges of Christian sanctuaries, and the doctrine of repentance."²

Whatever the origins of this tendency to substitute mutilation for capital punishment may have been,³ it was certainly a radical new departure which had a profound and an enduring effect on the Orthodox Christian ethos; but, when a new departure in the domain of Law was inspired by a Christian theology which placed the Old Testament on a par with the New Testament at the infinite altitude of absolute authoritativeness which was the self-evident prerogative of all Scriptures that were accepted as being the divinely revealed Word of God, it was almost inevitable that the birth of a new Christian law should be followed by a renaissance of the latent law of an Israel to which the Christian Church had insisted on affiliating itself by the compromising act of including the Books of the Law and the Prophets among Christianity's spiritual *impedimenta*.

When we count up the references or allusions to the Bible in the pre-

¹ The table of penalties in *Ecloga*, chap. 17, is summarized in Bury, Appendix, p. 529.—A.J.T.

² Bury, Appendix, p. 529, following Zachariä von Lingenthal, K. E.: *Geschichte des Griechisch-Römischen Rechts* (Berlin 1892, Weidmann), pp. 330-3. When the writer of this Study was making the present footnote on the 10th March, 1950, he had at one elbow Bury's own copy of this work of Zachariä von Lingenthal's, marked with the notes in pencil, from Bury's hand, which the English historian had eventually used in writing his own appendix on Graeco-Roman Law, while at his other elbow he had the copy of the volume of Bury's edition of Gibbon, containing this appendix, which had been given to the writer by his Mother forty-five years back. The impression which this appendix had made on his mind at his first reading of it in A.D. 1905 had lost none of its vividness during the time that had passed between his receipt of this impression and his utilization of it.

³ One source of this new type of punishment seems to have been existing customary practice. 'The Roman magistrates seem to have made occasional use of such discretion as was allowed to them in the determination of punishments in order to inflict punishments' consisting of some form of mutilation (Zachariä von Lingenthal, op. cit., p. 331; cp. Collinet, op. cit., pp. 709-10). Zachariä von Lingenthal (op. cit., p. 332) throws out the conjecture that the authors of the *Ecloga* may have been influenced by an exhortation—thrice repeated in the Gospels (Matt. v. 29-30; Matt. xviii. 8-9; Mark x. 43-47)—to cut off or pluck out a hand, foot, eye, or other offending member rather than condemn oneself to be cast into hell fire un mutilated. This remains no more than a guess, since none of these texts is actually cited in the *Ecloga*; but, if Orthodox Christian legislators did indeed take literally a piece of Primitive Christian poetry in which the problems of the Soul are approached in terms of physical symbolism, this unfortunate misinterpretation would be analogous, in its solemn innocence of irony, to the fortunate misinterpretation of Ovid's cynical prescriptions for the conduct of sordid amours which was one source of the Medieval Western troubadours' ideal of Romantic Love (see Lewis, C. S.: *The Allegory of Love: A Study in Medieval Tradition* (Oxford 1936, Clarendon Press)).

face to the *Ecloga*, we find that the Old Testament is cited half as many times again as the New Testament.¹ It is true that all the six citations from the Old Testament are taken from 'the Prophets' (in the comprehensive traditional Jewish usage of that label) and not from 'the Law'; and the Prophet Amos seems to have been especially venerated by Leo Syrus, to judge by the fact that this emperor not only cited one text from the Book of Amos in the preface to the *Ecloga* but also reproduced another² in mosaic over the chancel arch of the church of Saint Eirênê at Constantinople when he rebuilt it after a fire.³ Yet, in this Orthodox Christian evocation of the Old Testament in the field of Law, it was inevitable that, in the long run, 'the Law', and not 'the Prophets', should prevail; and, sure enough, an *Ecloga Legis Mosaicae* eventually made its appearance in the corpus of an *Ecloga ad Procheirum Mutata* derived from an *Ecloga Privata* which was itself an emanation from the original *Ecloga* promulgated by the Emperors Leo and Constantine in A.D. 740.⁴

If there is truth in the proverb that 'coming events cast their shadows before them', we should not be surprised to find in the original *Ecloga* some unacknowledged influence of a Mosaic Law that, in the gradual development of East Roman legislation, was to take perhaps as many as four centuries to rise naked to the surface; and, if we apply this clue to our search for the original inspiration of the *Ecloga*'s revolutionary partiality for punishments in the form of mutilations, commended as 'humanitarian' substitutes for the death penalty, we may come to the conclusion that the eighth-century legislator is more likely to have been inspired by a correctly literal interpretation of the *Lex Talionis*⁵ as enunciated in 'the Covenant Code'⁶ of the *Corpus Mosaicum* than by an

¹ The passages cited from the New Testament are 1 Pet. i. 17; 1 Pet. v. 2; Luke xvi. 17; John vii. 24. Those cited from the Old Testament are Isa. viii. 20; Ps. lviii. 1-2 [in the Septuagint's version: Ps. lvii. 2-3]; Eccl. vii. 4 and 6; 1 Kings iii. 16-28; Isa. v. 23-24; Amos ii. 6.

² Amos ix. 6.

³ See Freshfield, E. H.: *Roman Law in the Late Roman Empire* (Cambridge 1932, Bowes & Bowes), p. 46.

⁴ See Collinet, op. cit., p. 717.

⁵ The possibility that, in this point, the *Ecloga* may owe an unacknowledged debt to the *Corpus Mosaicum* comes to look almost like a positive probability when we observe that the contrast between the *Ecloga* and the *Corpus Iustinianum* in the matter of their respective philosophies of punishment had been anticipated by a corresponding contrast between Israel's 'Covenant Code' and the Sumeric Code of Hammurabi. 'The Code of Hammurabi is much the more severe of the two and uses the penalty of capital punishment to a much greater extent' (Smith, J. M. P.: *The Origin and History of Hebrew Law* (Chicago 1931, University of Chicago Press), p. 20, quoted already in VI. vii. 293, n. 1). On the other hand 'the rectification in the direction of greater humanity' which 'the Covenant Code', like the *Ecloga*, introduced in its departures from the provisions of the latest code of an antecedent civilization largely consisted, in the earlier case as well as in the later, in the replacement of the death penalty by various forms of mutilation: 'Eye for eye, tooth for tooth, hand for hand, foot for foot, burning for burning, wound for wound, stripe for stripe' (Exod. xxi. 24-25).

We may also observe that the Code of Hammurabi and the *Corpus Iustinianum* agreed with one another on a further point of common difference from the Mosaic Law and the *Ecloga* alike. 'The second decalogue of "the Covenant Code" (Exod. xxi. 12-27) deals with personal injuries. The Code of Hammurabi deals with the same class of offences (§§ 195-214). The greater number of the laws in Hammurabi's Code is due in part to the fact that the fine or penalty is graded according to the social and economic rank of the one injured' (Smith, op. cit., pp. 21-22). Correspondingly, 'it is worth while to observe in the *Ecloga* a democratic feature which marks a real advance, in the interests of justice, on the Justinianean code. The *Ecloga* metes out the same penalties to poor and rich, whereas the older law had constantly ordained different punishments for the same offence, according to the rank and fortune of the offender' (Bury, Appendix, p. 530).

⁶ Exod. xxi. 23-25.

incorrectly literal interpretation of a piece of poetic symbolism in the New Testament.¹

In contrast to the gradualness and unselfconsciousness of this renaissance of the Mosaic Law out of an Orthodox Christian Law's Israelite Scriptural heritage, the renaissance of the Roman Law out of Orthodox Christendom's own Hellenic antecedents² was both selfconscious and abrupt. In the preface to 'the Handbook' (ὁ πρόχειρος νόμος) promulgated between the years A.D. 870 and A.D. 879 by the founder of the Macedonian Dynasty of East Roman Emperors, Basil I, in conjunction with his sons and colleagues Constantine and Leo (VI), the new legislators gave notice³ that the *Ecloga* was hereby abrogated, not indeed entirely, 'but to the requisite extent' (ἀλλ' ὅσον ὠφείλεν), while, in the preface to a subsequent draft for a second edition (ἐπαναγωγή) of 'the Handbook' which was published between the years A.D. 879 and A.D. 886 in the names of the Emperors Basil I, Leo VI, and Alexander, notice was given that 'Our Imperial Majesty . . . has totally (πάντη) rejected and scrapped the imbecilities promulgated by the Isaurians⁴ in defiance of the . . . Divine Dogma and to the undoing of the salutary laws'.

The *odium theologicum* which the Macedonian Emperors here advertise as their motive for setting themselves the task of superseding their Syrian predecessors' legislation either partially or completely might perhaps not have been a sufficiently powerful motive in itself to nerve them for the formidable positive enterprise of resuscitating the Justinianean Law if they had not already found their hands being forced by the mounting pressure of practical needs arising from an increasing complication and sophistication of life in the body social of a then rapidly advancing Orthodox Christian Civilization. The relatively simple 'Selection' that had satisfied the legal requirements of the nascent Orthodox Christendom of the eighth century of the Christian Era was inadequate to meet the additional demands made on the Law by the cumulative effect of a subsequent 130 years and more of social progress; and we may conjecture that, even if the Syrian Dynasty had not identified itself with Iconoclasm, or, alternatively, if the Iconoclastic Movement which the Syrian Emperors did promote had never been reversed by an Iconodule reaction, a ninth-century East Roman Imperial Government would still have found in a resuscitation of the Justinianean Law the most obvious method open to them for providing a more advanced Orthodox Christian Society with the more subtle legal apparatus which had now become one of its crying needs. In any case—whatever may have been the respective parts played by practical necessity and religious animus in stimulating the Macedonian legislators to engage in necromancy—their two preliminary experiments in the Black Art, of which 'the Handbook' and 'the Second Edition' were the trophies, were followed up promptly by the promulgation, circa A.D. 888–90,⁵ of 'the Imperial Decisions' (τὰ βασιλικά) in no less than sixty books, and tardily⁶

⁵ Constantine IX (X) Monomákhos's Law School had the same ironic fate as the

² See IX. viii. 103.

by the foundation of an Imperial School of Law at Constantinople in A.D. 1045.¹

The ninth-century Vasilican ghost of a sixth-century *Corpus Iustinianum* resembles its original in presenting an imposing first appearance which it is incapable of sustaining under closer examination. The only touch of originality in the codificatory work of the Emperor Leo VI is his substitution, in the *Vasiliká*, of a single unitary system of classification for Justinian's dispersion among four works (Code, Digest, Institutes, and Novels) of materials concerning the same subjects.² But

'within the titles, the laws (or chapters) are not the personal work of Leo; their text was in no way revised by the commissioners for the Basilics. They were all drawn from earlier works, chiefly from the Code and the Digest, a very few from the Institutes, many from the Novels of Justinian and his successors, a few also from the *Procheiron*. The laws are all given in Greek; when they are derived from the three Latin works of Justinian, they have been extracted, not from the originals, but from Greek commentaries of the sixth and seventh centuries.'³

To quarrel with a renaissance for being unoriginal is a criticism that might perhaps be discounted as captious; but the ineffectiveness that is another characteristic of the Macedonian Dynasty's attempt to reinstate the Roman Law is a more serious weakness; for a ghost, after all, is only distinguishable from a nonentity in so far as he succeeds in making an impression on the living men and women whom he haunts. The ninth-century renaissance of Roman Law in Orthodox Christendom showed itself conspicuously impotent to supersede in reality the Iconoclast Emperors' new Christian Law which it was abrogating verbally, and even impotent to exorcise the rival ghost of a Mosaic Law which was re-emerging out of the Christian Law's Pentateuchal crypt.

It is significant that the Iconodule legislator Basil I's 'Handbook' (*πρόχειρος νόμος*) 'in its second part also reproduced the provisions of the *Ecloga*, in spite of the abuse of its authors in the prologue,'⁴ and that in Basil's 'Second Edition' (*ἐπαναγωγή*), which professed to have abolished the *Ecloga*, no longer just partially, but entirely, the *Ecloga* was actually followed even more closely than it had been in 'the Handbook'.⁵ The strength of the *Ecloga*, in its encounter with a resuscitated Roman Law, lay in the fact that the *Ecloga* was a faithful reflection of the Orthodox Christian *êthos*—partly because it had successfully caught

Emperor Justinian's codification. The work had no sooner been accomplished than it was left high and dry by a catastrophe that swept away a complicated and sophisticated social life which was both the *raison d'être* and the *sine qua non* of a refined legal apparatus. The foundation of the East Roman Imperial Law School in A.D. 1045 was followed within twenty-six years by the simultaneous military disasters at Bari and Manzikert (Melazkert) in A.D. 1071 which heralded the débâcle, not only of the East Roman Empire, but of the Orthodox Christian Civilization (see IV. iv. 354, n. 2), just as the completion of Justinian's codificatory work in A.D. 529 had been followed within sixty-eight years by the débâcle heralded by the assassination of the Emperor Maurice in A.D. 602 (see VI. vii. 270).

the Byzantine spirit and partly also, no doubt, because it had done so much to make that spirit what it had come to be—whereas the Hellenic spirit expressed in the Late Roman Law was an alien presence in an Orthodox Christian environment. In the Law of Marriage, for example, 'Basil returned to the Justinianean system, but the doctrine of the *Ecloga* seems to have so firmly established itself in custom that Leo VI found it necessary to make a compromise and introduced a new system which was a mixture of the Iconoclastic and the Justinianean doctrines.'¹ Basil had a similar experience when he sought to undo his Syrian predecessors' beneficent work of humanizing the barbaric Roman institution of the *Patria Potestas*.² In this sphere, likewise, 'Basil revived the Justinianean legislation; here, however, as in many other cases, the letter of Basil's law books was not fully adopted in practice, and was modified by a novel of Leo VI which restored partly the law of the *Ecloga*'.³ As for the criminal law, 'here the system established by the *Ecloga* is retained in most cases, and sometimes developed further',⁴ against the grain of a Macedonian legislation which was consciously striving to depose the Iconoclast legislators and to reinstate Justinian.

'The system of punishments provided in the *Ecloga* continued on the whole to set the standard for later ages. The relevant passages of the *Ecloga* are for the most part incorporated into the *Procheiron*, into the *Epanagoge*, and even into the *Vasilika*, some of them *verbatim*, some in rather different language or in a slightly modified form—though it is at the same time also true that the *Ecloga*'s system of punishments is not retained or applied in its purity. The penal chapters of the [Justinianean] Digest and Code have on the whole also found their way into the *Vasilika*, with the result that the *Vasilika*—particularly in contexts in which they are concerned with crimes or misdemeanours not expressly dealt with in the *Ecloga*—prescribe the old [Roman] punishments which frequently contradict the spirit of the new system.'⁵

The vigour with which this would-be Christian spirit continued to assert itself against the would-be Roman spirit of an imperious Justinian's impotent ghost is betrayed in a sentence in the preface to the *Epanagoge* leading up to the passage, quoted above,⁶ in which the Macedonian legislators denounce their Syrian predecessors and all their legal works.

'The experience by which Our Majesty has been aroused and stimulated to bestir itself to retrieve and proclaim the good world-saving law with the utmost zeal and utmost care is what we can only describe as our initiation in the secret chambers of the heart by the divine intervention of the Trinity in Unity (ἐκ τῆς φύσικῆς μοναρχίας καὶ τριαδικῆς δεσποτείας . . . θείως πως καὶ ἀπορρήτως μνηθεῖσα).'

Thus, though the Macedonian Emperors were bent on reinstating a Roman Law that had been disestablished—wrongfully, in their belief—by the preceding Syrian Emperors' innovations, it never occurred to

⁵ Bury, *ibid.*

⁶ On p. 27.

these Iconodules, any more than it would have occurred to their Iconoclast bugbears, to look for the sanction of Law in autonomous acts of human volition. As a matter of historical fact, the Roman Law, whose champions the Macedonian Emperors professed to be, had been the man-made product of a well-documented series of legislative acts performed first by the Roman People in their lawfully constituted assemblies and latterly by Emperors to whom the People had formally delegated their legislative power. Yet, in defiance of all recorded Roman legal history, the Macedonians showed themselves true Orthodox Christians in displaying a veritably 'Isaurian' inability to imagine that any law could be validated by any other sanction than the ordinance of a God who had 'given Man a good law to salvage and blend and preserve' a Human Nature in which the polar and antithetical elements of spirit and matter had been combined and compounded by the Creator.¹ In other words, 'the salutary law' which the Macedonians were vindicating against the Iconoclasts was founded, in the Macedonians' belief likewise, on 'the divine dogma', and their quarrel with these Syrian predecessors of theirs was a family quarrel in which the opposing theses that were championed with so much zeal and bitterness by their respective advocates were two closely related variants of one identical Orthodox Christian creed.

The plot of a legal drama in which a Christian new departure was dogged by the successively raised ghosts of Moses and Justinian can be seen likewise working itself out on a Western stage on which Leo Syrus's role was played by Charlemagne.

'The Carolingian legislation . . . marks the emergence of the new social consciousness of Western Christendom. Hitherto the legislation of the Western kingdoms had been of the nature of a Christian appendix to the old barbarian tribal codes. Now, for the first time, a complete break was made with the Past, and Christendom enacted its own laws, which covered the whole field of social activity in Church and State and referred all things to the single standard of the Christian *êthos*. This was inspired neither by Germanic nor [by] Roman precedent.'²

In Western, as in Orthodox, Christendom, however, the ghost of Moses trod hard on the Apostles' and Evangelists' heels.

'The Carolingian Emperors gave the law to the whole Christian people in the spirit of the kings and judges of the Old Testament, declaring the Law of God to the people of God. In the letter which Cathaulf addressed to Charles at the beginning of his reign, the writer speaks of the king as the earthly representative of God, and he counsels Charles to use the Book of Divine Law as his manual of government, according to the precept of Deuteronomy xvii. 18-20, which commands the King to make a copy of the Law from the books of the priests, to keep it always with him, and to read it constantly, so that he may learn to fear the Lord and keep

² Dawson, Christopher: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), p. 90.

Yet, in Western, as in Orthodox, Christendom, a resurgent Moses was overtaken by a resurgent Justinian.

In the course of the eleventh century of the Christian Era the Imperial Law School established by official action at Constantinople in A.D. 1045² found its counterpart in Western Christendom at Bologna in the spontaneous emergence there of an autonomous university dedicated to the study of the Justinianean *Corpus Iuris*;³ and the effect of this Western renaissance of the Roman Law was not confined to the abortive attempt—which was the Bolognese necromancers' first essay in the practical application of their art—to use the Constantinopolitan Roman Imperial Prerogative, in the form in which it had emerged from Justinian's hands, as a legal weapon to reinforce the armaments of Hohenstaufen Emperors in their twelfth-century renewal of the Holy Roman Empire's eleventh-century struggle with the Papacy.⁴ Though in Western Christendom—in contrast to the course of Orthodox Christian history—a resuscitated Roman Law thus failed to serve the political purpose of under-pinning a resuscitated Roman Empire, it did potently serve the different political purpose of fostering the revival, on Western ground, of an earlier Hellenic political institution: the sovereign independent parochial state.⁵

In Western Christendom's sinister evocation of this formidable ghost of political parochialism from a defunct antecedent civilization's dead past, the graduates of the University of Bologna played parts comparable to those played in the evocation of ghosts of dead universal states by the

² See p. 28, above.

3 Ibid., pp. 90-91.
4 Bury conjectures (Appendix, p. 526) that the foundation of the Constantinopolitan Law School in A.D. 1045 'may have possibly had some influence on the institution of the school at Bologna half a century later'. This is perhaps unlikely, considering the mutual hostility of Western and Orthodox Christendom towards one another in that age. It is true that the Romagna, of which Bologna was the principal city, had been, as was attested by its name, the last fragment of Italy to pass out of the political jurisdiction of a Roman Imperial Government at Constantinople. Yet in A.D. 1045 little less than three centuries had elapsed since the Constantinopolitan Government's definitive loss of the Exarchate in A.D. 751 (see VII, p. 103). There is no ground for supposing that in the eleventh century the Romagna had not long since lost its familiarity with the Orthodox Christian World which Venice and Amalfi then still retained thanks to the importance of the part played in their economies by their trade with the Levant. This negative conclusion does not, of course, imply that the location of the earliest and greatest Western school of Justinianean Law at Bologna was nothing more than a geographical accident. It was assuredly not an accident that the study of the Justinianean Law in the West should have radiated from the principal city of an Italian province in which this law had been in force, *de facto* as well as *de jure*, for little less than two centuries running from the systematic reincorporation of Italy into the Constantinopolitan Roman body politic, after the final liquidation of an Ostrogoth resistance movement in A.D. 553, down to the final loss of the Ravennese Exarchate by the East Roman Emperor Constantine V in A.D. 751 (if we may assume that the *Ecloga* had not had time to supplant the *Corpus Iustinianum* in the Exarchate during the eleven years that had elapsed since its promulgation in A.D. 740). Those two centuries of practical familiarity with the *Corpus Iustinianum* must have enabled this version of the Roman Law to strike far deeper roots in 'the' Romagna than in an adjacent Po Basin which had been converted from a Romania into a Lombardia at intervals ranging from a period of no more than fifteen to a period of no more than fifty years (A.D. 568-603) after the date of the integral reincorporation of Italy into the Constantinopolitan Roman Empire in A.D. 553.

⁴ See IV. iv. 557; VII. vii. 539; and p. 9, above.

⁵ The Western renaissance of this Hellenic political institution has been noticed on pp. 7-8, above.

graduates of the East Roman academy founded by the Caesar Bardas at Constantinople *circa* A.D. 864¹ and the corresponding Far Eastern academy that the T'ang Emperor T'ai Tsung brought into existence at Si Ngan when in A.D. 622 he reinstituted the Han imperial régime's system of competitive examinations in the Confucian Classics as the method of selecting new recruits for the Imperial Civil Service.² The civil lawyers educated by Bologna and her daughter universities became the administrators, not of an abortive 'Holy Roman Empire', but of parochial sovereign states on Western ground, and the efficiency of their professional services was one of the secrets of this other resuscitated Hellenic political institution's progressive victory over all the alternative forms of political organization that were latent in Western Christendom's original social structure.

This victory was not won exclusively by the labours of the doctors of civil law whom Bologna began to breed in the generation of the pioneer Western civil lawyer, Irnerius (*florebat circa* A.D. 1090-1130). While the Bolognese civilians were providing the cities of North and Central Italy with administrators whose competence enabled the nascent communes to cut loose from their post-Carolingian prince-bishops' apron-strings and launch out upon a career of civic self-government,³ the canonists, who were able to supplement the Bolognese school of civil law with a sister faculty of ecclesiastical law after the publication of Gratian's encyclopaedic *Decretum circa* A.D. 1140-50, made an indirect and unintentional contribution to the development of the Western Parochial Secular State in the course of their purposive organization of a Western Oecumenical Church under the sovereignty of the Papacy; and this unforeseen and unintended appropriation of the fruits of the Medieval Western canon lawyers' labours for the benefit of the Modern Western parochial sovereign states, that were eventually built out of the ruins of a fallen Medieval Western Papal Commonwealth,⁴ is one of the ironies of history; for in A.D. 1268, on the morrow of the cold-blooded execution of the last of the Emperor Frederick II Hohenstaufen's heirs, it looked as if the perpetuation of this thirteenth-century triumph of a Western Papal commonwealth designed and built by Bolognese canonists had been assured by the now manifestly irretrievable overthrow of a Western oecumenical empire which the twelfth-century Bolognese civilians had vainly aspired to fortify by lending Justinianean flesh and blood to a Carolingian wraith.

On the Papal side in a struggle between the Papal Church and the Hohenstaufen Dynasty which had lasted for a hundred years, not only the rank-and-file, but the leaders themselves, had been recruited from the Bolognese school of Canon Law and had owed their victories to the weapons which their education had placed in their hands and trained them to use. Bologna was the *alma mater studiorum* and *mater saeva*

³ The role of the Bolognese Faculty of Civil Law in providing civil servants for the nascent Italian city-states is brought out by Dawson in *op. cit.*, pp. 224 and 227.

⁴ This plundering of a Late Medieval Oecumenical Western Church's administrative armoury by the Papacy's parochial secular diadochi has been noticed in IV. iv. 577-8.

*cupidinum*¹ of Pope Alexander III (*fungebatur* A.D. 1159-81), Pope Lucius III (*fungebatur* A.D. 1181-5), Pope Innocent III (*fungebatur* A.D. 1198-1216), and Pope Innocent IV (*fungebatur* A.D. 1243-54), while Pope Honorius III (*fungebatur* A.D. 1216-27), Pope Urban IV (*fungebatur* A.D. 1261-4), and Pope Clement V (*fungebatur* A.D. 1265-8) were also likewise canonists.² Thus no less than half the number of the incumbents of Saint Peter's chair during the crucial years A.D. 1159-1268 had arrived at the apex of the Western ecclesiastical hierarchy by climbing a recently erected juristic ladder.³ In the now decisively concluded struggle between the Papacy and the Holy Roman Empire the canonists had been both the principal agents of the Church's victory and the principal beneficiaries from the spoils; and in the third quarter of the thirteenth century it looked as if the civil lawyers whose loss gave the measure of the canonists' gain had obtained the poorest of consolation prizes for their failure to become the omnipotent civil servants of a Western avatar of a secular Roman imperial body politic. When they had been disappointed of the realization of this grandiosely ambitious dream of oecumenical jurisdiction, what did it signify that they had been finding obscure employment as the modest notaries and secretaries of fledgling parochial Italian city-states?

Even after a Pope Boniface VIII (*fungebatur* A.D. 1294-1303), who was both a trained canonist and trained civilian,⁴ had brought to the ground in its turn the Papal *Respublica Christiana* that his canonist predecessors had reared so high upon the Holy Roman Empire's ruins, the oecumenical administrative machine which the canonists had been building up for the Papal Church was the one wing of the Innocentian edifice that not only survived intact but continued to grow. The financial organization to which an Innocent IV had given an impetus, in order to provide a militant Roman See with the sinews of war, was carried to its acme during a fourteenth-century 'Babylonish Captivity' (*durabat* A.D. 1309-77) which gave the Papacy's fiscal officers the advantage of operating from a headquarters situated near the geographical centre of communications of the Western Christendom of the day.⁵

After the return of the Papal Curia to Rome in A.D. 1377, yet another century had to pass before the 'Modern Western' type of parochial polity, which had come into being in the Late Medieval Italian city-states, thanks to the creative work of the civil lawyers who were these cities' public employees, made its fortune by imposing its exotic pattern of administrative practice and political theory on the feudal monarchies in the Transalpine and Transmarine provinces of the Western World; and this moment of transition from the 'Medieval' to the 'Modern' chapter of the history of the Western World at large, outside the narrow limits of a politically precocious Northern and Central Italy, at last revealed, for the first time, the ironic destiny of a Western Christian

¹ Horace: *Carmina*, Book I, Ode xix, l. 1.

² See IV. iv. 530-1.

³ Dawson points out, in op. cit., p. 227, that Alexander III was actually a pupil of Gratian and a commentator on his works, and that Innocent III, in his day, was a pupil of the Bolognese canonist Uguccio of Pisa.

⁴ See IV. iv. 532.

⁵ The convenience of the location of Avignon from the Papal administrators' standpoint has been noticed in IV. iv. 520, n. 2, and 571, n. 1.

Canon Law which had been worked out at Bologna on the model of a pagan Roman Civil Law in order to give a Papal Church the victory over an abortive Western resuscitation of the Roman Empire. In the modern chapter of Western history the Canon Law continued to play a major part in Western life only in so far as its practical applications in the spheres of administration and finance were pressed into the service of the parochial secular states which boisterously held the stage in this noisy 'modern' act of a Western tragi-comedy.¹

This Modern role of the Canon Law was, however, as unobtrusive as it was influential, and the legal triumph that attracted all the éclat was the 'reception' of the Justinianean Roman Law in one parochial state after another of a now rapidly and widely expanding Western body social. In the Western Civilization's European homelands a conquering Roman Law overleapt an intractable England to seize upon Scotland;² but the winning of this outpost in a European *Ultima Thule* was merely the prelude to a Transoceanic expansion. In the New World of the Americas, the Spanish Crown was as much indebted to the faithful services of its civil lawyers for its hard-won sixteenth-century victory over the truculent Castilian *conquistadores* as the Roman See had been to the services of its canonists for its thirteenth-century victory over the Hohenstaufen. In the New World of South Africa, Dutch colonists, planted there after the 'reception' of the Roman Law in their mother country, gave Justinian a fresh footing on a Continent from whose northern extremity he had been evicted a thousand years earlier by the artificers of an Islamic Law which had entered Egypt and the Maghrib in the train of seventh-century Arab Muslim conquerors.

The Islamic Law, like the Roman Law, had its renaissances in the

¹ If, at first sight, it might seem surprising that it should have been feasible thus to turn an oecumenical Canon Law to account for the benefit of parochial secular states that were the Civil Law's nurslings, an explanation of this apparent enigma is to be found in an illuminating passage of Christopher Dawson's *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), pp. 224-5 and 227:

'While the University of Paris throughout the Middle Ages was essentially a clerical institution, Bologna was largely a lay university where the lawyers and officials who played such a large part in the government of the Italian cities received their education.

'No doubt the development of the study of the Canon Law which was associated with the work of Gratian about 1140 made Bologna an equally important centre of training for the administrators and lawyers of the Mediaeval Church. But it was as a school of Roman Law that Bologna first became famous in the days of Irnerius (*circa* A.D. 1090-1130), and it was the civilians, not the canonists, who set the standard and determined the course of studies. . . .

'The fact that [the] work [of actually supplying the Mediaeval Church with its organisation] was done by men trained in the same school and the same traditions as the civilians who during the same period were organising and rationalising the Mediaeval State was of the first importance for the history of Western institutions; and it was in the life of the Italian cities that this process of interaction was most complete. The rulers and officials of the City-State and the administrators of the Church were drawn from the same classes, [were] educated in the same universities, and shared the same intellectual background, so that there was a continual process of mutual criticism which stimulated the growth of an educated public opinion, such as did not yet exist in Northern Europe.'

² 'It is clear that the Common Law of Scotland is in considerable measure derived from the Civil Law; to a less extent, but in important particulars, from the Canon Law. Though there was probably no period at which the Civil Law was accounted part of the law of Scotland, yet that law, as explained and in some respects amended by the Dutch and French commentators of the sixteenth and seventeenth centuries, is the basis of the Scots law of contract and of property, apart from feudal conveyancing' (Gloag, W. M., and Henderson, R. C.: *Introduction to the Law of Scotland*, 3rd ed. (Edinburgh 1939, Green), p. 8).

histories of civilizations of a new generation that eventually arose out of the ruins of the universal state in which the resuscitated law had formerly been current; but this broad general resemblance between the respective posthumous fortunes of the Justinianean *Corpus Iuris* and the Islamic *Shari'ah* is diversified by differences of detail due to differences between the Roman Empire and the Arab Caliphate in the several points of their antecedents, their origins, their structures, and their relations to the higher religions that propagated themselves within these universal states' frontiers.

The difference between the Roman Empire and the Arab Caliphate that had the greatest effect in giving different turns to the posthumous histories of the Roman Civil Law and the *Shari'ah* was that the Arab conquerors who built the Caliphate and gave this oecumenical empire an oecumenical law were likewise the missionaries of Islam, so that, in the Caliphate, Religion, Law, and Government were all in the same hands from the outset, in sharp contrast to the history of the relations between these three activities in the Roman Empire, where an oecumenical government and an oecumenical law, created by pagan hands, had set hard in their pagan mould before the Roman imperial régime found itself constrained to come to terms with an exotic Christian Church against which this pagan Hellenic universal state had been fighting a losing battle for a quarter of a millennium ending in the generation of Constantine.

The common purpose of providing the legal currency for a universal state was, it is true, reflected in certain similarities in the respective processes of evolution through which these two oecumenical systems of law arrived at their final forms. The *Shari'ah* in the Age of the Caliphate, like the Roman Law in the Imperial Age, owed its development largely to jurists recruited, not from the ruling people itself, but from these empire-builders' subjects; and in both episodes of legal history the imperial jurists who had thus made their way up from below drew freely upon their indigenous social heritage in carrying out their arduous task of transfiguring the archaic and fragmentary traditional law of conquerors, who had been marchmen in the Roman case and transfrontier barbarians in the Arab case, by smoothing away its rugged edges and filling in its lacunæ until they had succeeded in making out of this unpromisingly incongruous material a legal system more or less capable of serving the complicated and sophisticated needs of the society on which the empire-builders had imposed their own law by right of conquest.¹ Owing, however, to the difference in the respective historical relations of Christianity and Islam to the founders of the oecumenical states that were their original political frameworks, the outcome of two otherwise more or less similar episodes of legal history was in the one case a still essentially pagan *Corpus Iuris Romani Iustinianeum* and in the other case a *Shari'ah* in which the ingenuity of non-Arab jurists had not only eked out a most inadequate Arab customary law by surreptitiously introducing elements of Oriental Roman Law and other legal systems previously current

¹ The evolution of the Roman Law has been sketched in VI. vii. 262-3 and 265-8; the evolution of the *Shari'ah* has been sketched *ibid.*, 288-91.

among the populations that the Arabs had subjugated, but had presented the whole of this amalgam in the form of logical deductions and inductions from the Qur'ān and the Traditions of the Prophet Muhammad.

It will be seen that, in thus resetting fragments of old secular law in a new religious mould, the Islamic jurists of the Umayyad and 'Abbasid ages who were the authors of the *Shari'ah* were doing something reminiscent, not so much of the interpretative and codificatory work of the Roman jurists of the Imperial Age, as of the creative work of the Orthodox Christian authors of the *Ecloga* and the Western Christian authors of Charlemagne's would-be Christian legislation; and, in the light of this analogy, it might perhaps have been expected *a priori* that there would have been no occasion for a renaissance of the *Shari'ah* because there would have been no necessity for this already developed and established Islamic Law to pass out of currency as a result of the downfall of the Caliphate—considering that Islam itself survived the dissolution of the Caliphate as robustly as Christianity had survived the downfall of the Roman Empire.

If the Eurasian Nomad barbarians who overran the derelict provinces of a dissolving Caliphate in the course of the two centuries ending in the Mongols' sack of Baghdad in A.D. 1258 had all been as barbarous as the Eurasian Nomad and North European sedentary barbarians who overran the Roman Empire's derelict western provinces in the fifth and sixth centuries of the Christian Era, they might indeed all have taken the option, which the eleventh-century Saljūq Turkish barbarian invaders of the Caliphate did take, of 'receiving' the *Shari'ah* as an automatic consequence of their conversion to the faith of a rapidly growing Muslim majority of the ex-subjects of the universal state whose former territories these barbarians were now overrunning. As it happened, however, the Mongols, who broke upon the shores of Dār-al-Islām in the last and most violent wave of the Eurasian Nomad invasion of the Caliphate's derelict domain, and the Türkmen ancestors of the 'Osmanlis, who fled westwards, before the Mongols' menacing advance, from Central Asia into North-Western Anatolia, both resembled the Arab founders of the Caliphate in being barbarians who were gifted with exceptional capacities; and their ability displayed itself in the originality of their creative work in the field of law as well as in the field of politics.

In previous contexts¹ we have already noticed that Chingis Khan and his successors were so confident of the virtue and value of their own traditional barbarian customary law that they made the audacious attempt to impose it on their subjects by force, in place of the *Shari'ah* and the other legal systems under which the conquered peoples had been living at the time when they had been overtaken by the Mongol conquest; and in an earlier Part of this Study² we have also taken a glance at 'the peculiar institution' which the 'Osmanlis fashioned for themselves—as their instrument for conquering and holding an oecumenical empire—out of elements of the Eurasian Nomad culture which were just as independent of the *Shari'ah* as was Chingis Khan's Mongol

¹ In VI. vii. 74 and 256-7; and IX. viii. 354-5.

² In III. iii. 22-50.

Yāsāq itself. The Mongol and the Ottoman attitude towards the *Sharī'ah* were, of course, very different; for, while the Mongol conquerors of the Old World remained—in some cases for as long as a hundred years after the conquest—either militant shamanists or militant Nestorian Christians who were bent upon suppressing the *Sharī'ah* and superseding it, the Ottoman 'Ghāzis of Rūm',¹ so far from being persecutors of Islam, were zealous propagators of it. Yet, though the peculiar and characteristic Ottoman institution of the Pādishāh's Slave-Household was built up, not as a substitute for the Islamic dispensation, but as an instrument for the enlargement of the domain of Dār-al-Islām by slaves of a Muslim potentate who were Muslims themselves, besides being peculiarly trained *qullar*, it was nevertheless also true that 'the Ottoman Ruling Institution', as it has been called by one of the most discerning of the Modern Western students of it,² was based on non-Islamic foundations, was set up alongside of 'the Muslim Institution' as an independent organization, and was the predominant organ in the Ottoman body social during the creative age of Ottoman history in the fourteenth and fifteenth centuries of the Christian Era.³

Both the independence and the predominance of the Pādishāh's Slave-Household were asserted by its members when they prevailed upon Sultan Bāyezīd II (*imperabat* A.D. 1481-1512) to grant their corporation the privilege of judicial autonomy.

'The members of the Ruling Institution had not always had their own system of justice; they had long been under the jurisdiction of the ordinary Muslim courts. This had led to an essential difficulty: the ordinary courts were part of another institution and were recruited in a wholly different way; their judges had risen through a rival system of education, and were men of letters rather than men of war; the favoured *qullar* of the Sultan had therefore come to feel averse to obeying them. Accordingly, Bāyezīd II had ordered that the members of his family should be judged by their own officers. This was a radical change; for it brought into prominence the distinction between the two institutions, and had the further effect of setting off the *qullar* from all the rest of the population of the Empire and of constituting them almost a separate nationality.'⁴

After the relative power of 'the Ruling Institution' of the Ottoman body politic had thus risen to its apogee at the turn of the fifteenth and sixteenth centuries of the Christian Era, the balance promptly began to swing over to 'the Muslim Institution's' side as a consequence of the

¹ The Timurid Mughal Emperor Bābur's habitual use of this periphrasis for describing the 'Osmanlis has been noticed in I. i. 349, n. 1.

³ See *ibid.*, pp. 233-5.

⁴ *Ibid.*, p. 116. As has been noticed in this Study in IX. viii. 186, n. 2, above, the practical effect of this exemption of the *qullar* from the jurisdiction of the Islamic judicial authorities was to confer on them the corporate status of a *millet* which, in the Ottoman Empire, was enjoyed likewise by another corporation of privileged Muslims, the Seyyids (see Lybyer, *op. cit.*, pp. 206-7 and 216). The privilege of judicial autonomy which was thus obtained by the slave companions of the Ottoman Pādishāhs was also possessed by the free companions of the Macedonian Kings in the post-Alexandrine as well as in the pre-Alexandrine Age of Hellenic history—at any rate in any case in which one of the Companions was being tried on a capital charge (see Granier, F.: *Die Makedonische Heeresversammlung* (Munich 1931, Beck), pp. 51-52).

extension of direct or indirect Ottoman rule over five-sixths of the Arabic Muslim World, including the dominions of the Mamlūks in Syria, Egypt, and Arabia, in the course of the fifty-eight years running from A.D. 1516, when Syria was occupied by Sultan Selīm I and Algiers by the 'Osmanli corsair Khayr-ad-Dīn Barbarossa, and A.D. 1574, which was the date of the 'Osmanlis' definitive eviction of the Spaniards from Tunis.¹ In the Arab countries ruled by Mamlūks who had inherited from their extinct Ayyubid masters a tradition of serving as defenders of the Islamic faith, and who had completed the expulsion of the Crusaders from Syria in order to turn this liberated province of Dār-al-Islām into a glacis covering the approaches to Islam's Egyptian citadel in the quarter from which Egypt was under the threat of Mongol attacks,² these *ci-devant* slaves who had entered into their former masters' heritage had sought to legitimize their usurpation of power by ruling in the name of a Cairene ghost of a Baghdādī 'Abbasid Caliphate;³ and, though these Mamlūks had, like the 'Osmanlis, developed 'a peculiar institution' of their own which, in their case, likewise, had been the secret of their success,⁴ the reign of the Islamic *Shari'ah* had been maintained unbroken and unimpaired in the Mamlūks' dominions by the Mamlūks' policy of wielding their power in a puppet 'Abbasid Caliph's name and by their prowess in preserving Syria and Egypt from being swept by a tornado of Mongol conquest that had devastated all the eastern provinces of Dār-al-Islām from Farghānah as far westward as the eastern bank of the Middle Euphrates.⁵ The conquest of the Mamlūk Empire by the Ottoman Sultan Selīm I in A.D. 1516-17 thus produced a sudden and drastic change in the demographic constitution of the Ottoman body politic by bringing under the Pādishāh's rule a mass of new Arabic-speaking Muslim subjects who knew no other dispensation than the *Shari'ah*;⁶ and this demographic change was quickly reflected in the field of law.

Already, nearly half a century before Selīm I (*imperabat* A.D. 1512-20) burst through the Taurus and descended upon the Arabic World in A.D. 1516, his predecessor Mehmed II the Conqueror (*imperabat* A.D. 1451-81) had found that the requirements of his Muslim subjects in an Ottoman Empire which in his reign was still confined to originally Orthodox Christian ground called for a new codification of the *Shari'ah* as expounded by a Hanafī school of Islamic jurists, whose presentation of the Islamic Law was the one that had been officially 'received' in the Ottoman dominions; and Mehmed II had accordingly put in hand a new Ottoman redaction of the *Shari'ah* according to Abu Hanīfah.⁷ This work, finished in A.D. 1470, was not sufficient in the days of Suleymān (*imperabat* A.D. 1520-66). At the time of its preparation the Ottoman Empire had been still wholly within territory that had re-

⁷ See Lybyer, op. cit., p. 152, following d'Ohsson, I. M.: *Tableau Général de l'Empire Ottoman* (Paris 1788-1824, Didot, 7 vols.), vol. i, p. 21.

mained Christian during all the early brilliant period of Islam';¹ and Sultan Mehmed's choice of a Christian renegade, Khosrev Pasha,² as his codifier of the *Shari'ah* for the use of an Iranic Muslim community *in partibus Christianorum* was a characteristic stroke of the Ottoman political genius in its pre-Selimian Age, however inappropriate the choice might look from a conservative Hanafite Sunnī Muslim standpoint. Since Mehmed II's day, however, the 'Osmanlis

'had conquered three seats of the later Caliphate—Damascus, Baghdad, and Cairo—and had come to hold the protectorate of the Holy Cities, where Muhammad and the early Caliphs had ruled. A new code of law, therefore, better adapted to the more widely Muslim character which the Empire had assumed, was [now] demanded. Suleymān charged Shaykh Ibrahīm Halabī with the task of preparing such a code; and the result, prepared before A.D. 1549, was the *Multeqā el-Ebhār* ('the Confluence of the Seas'), which remained the foundation of Ottoman Law until the reforms of the nineteenth century.'³

It was no accident that the work of replacing a redaction of the *Shari'ah* which had been made for Sultan Mehmed II by a Christian renegade should have been entrusted by Sultan Suleymān I to a Muslim-born doctor of the Islamic Law whose home was Aleppo—an Arabic-speaking Muslim city which was the nearest of all the seats of theological learning in an Arabic Muslim World to the new domain in Anatolia which had been won by Turkish Eurasian Nomad converts to Islam for an Iranic Muslim World at the expense of Orthodox Christendom.

This progressive renaissance of the Islamic Law in an expanding Ottoman Empire was achieved, as has just been observed, on the initiative of converted descendants of the local Eurasian Nomad barbarian interlopers when these 'Osmanlis eventually extended their rule over the Arabic-speaking portion of the former dominions of the 'Abbasid Caliphate. In the Transoxanian marches of a defunct 'Abbasid Caliphate and a nascent Iranic Muslim World the local Eurasian barbarian interlopers became converts to Islam in their turn in the fourteenth century of the Christian Era;⁴ but this tardy conversion of the Mongols of the Chaghatāy Horde was not sufficiently thorough or wholehearted to reconcile their sedentary Iranic Muslim subjects to an oppressive Nomad domination; and accordingly in Transoxania, in contrast to the course of events in the Ottoman World, the local renaissance of the *Shari'ah* was achieved in the teeth of the converted descendants of the barbarian conquerors, and not through their agency. In a previous context⁵ we have noticed that Timur Lenk rose to power by becoming the military leader of an anti-Nomad cultural reaction on

⁵ In II. ii. 147-8.

the part of the Transoxanian townspeople and 'ulamā which began as an insurrection against a Chaghatāy ascendancy and was followed up by Timur's military genius with a counter-offensive in which Cain took his long overdue revenge on a provocative Abel. In this place we have only to notice that Timur followed up his overt assumption of sovereign power at Balkh on the 8th April, 1369, by re-validating the *Shari'ah* in all fields that came within the *Shari'ah's* cognizance; and, though he seems to have refrained from following up this positive act by the negative one of expressly abrogating the Mongol *Yāsāq*, its abrogation was accomplished in effect by the reinstatement of an Islamic Law in whose sight *nihil humanum was alienum*.¹

(c) RENAISSANCES OF PHILOSOPHIES

In other contexts² we have watched the Confucian litterati surviving the dissolution of a Sinic universal state embodied in the Han Empire and eventually regaining their monopoly of an imperial civil service after a ghost of the Han Empire had been raised by the Sui Dynasty and kept on foot by the Sui's successors the T'ang; and in the same contexts we have also observed that, in achieving this remarkable recovery of lost ground on the plane of public administration, the Confucians were winning a political victory over Taoist and Mahayanian Buddhist contemporaries and rivals. The reestablishment by T'ang T'ai Tsung, in A.D. 622, of an official examination in the Confucian Classics as the method of selecting new recruits for the imperial civil service signified that, in this political field, the Taoists and Buddhists had let slip an opportunity for supplanting the Confucians which had seemed to be within the grasp of these upstart competitors for public office during a post-Sinic interregnum, when the prestige of the Confucians had been damaged by the collapse of the universal state with which they were identified, while, in a defunct Han Empire's former northern provinces, which had been the cradle of the Sinic culture, Taoists and Buddhists were enjoying the political patronage of barbarian rulers of local successor-states who found the Mahāyāna more attractive than Confucianism and who would have been glad in any case to recruit their civil servants from any non-Confucian community that might be qualified for office by possessing the necessary standard of education, rather than place themselves in the hands of Confucians whose loyalty they sagely doubted.

The contrast between this political failure of the Mahāyāna in Northern China in a post-Sinic Age and the success with which the Christian Church seized and harvested its corresponding opportunities in Western Europe in a post-Hellenic Age brings out the fact that—at any rate by comparison with Christianity—the Mahāyāna was a politically incompetent religion. The patronage of the parochial princes in Northern China during the best part of three centuries, running from

¹ Terence: *Hautontimorumenus*, I, 77 (Act I, scene i, line 25). See Cahun, L.: *Introduction à l'Histoire de l'Asie: Turcs et Mongols des Origines à 1405* (Paris 1896, Colin), pp. 469-72, and Bouvat, L.: *L'Empire Mongol, Deuxième Phase* (Paris 1927, Boccard), pp. 66-69.

² See VI. vii. 355-8, and pp. 649-81, below.

the break-up of the United Tsin Empire to its reconstitution by the Sui, was of no more avail than the more potent patronage of the Kushan Emperor Kanishka had been at the turn of the first and second centuries of the Christian Era. Even this royal aid failed to give the followers of the Mahāyāna a firm seat in a political saddle. As soon, however, as the encounter on Far Eastern ground between the Mahāyāna and Confucianism was transferred from an alien political plane to a spiritual plane on which both were breathing their native air, the fortunes of their almost bloodless war were dramatically reversed.

The Confucians exposed themselves to the risk of experiencing this *peripeteia* when they followed up the political triumph of securing the reinstatement of the Confucian Classics, as the shibboleth for admission into the civil service of an avatar of the Sinic universal state, by attempting to reanimate the thought latent in their literary canon. This process of re-eliciting a philosophy out of a cut-and-dried official examination-subject was started, after the T'ang régime's partial recovery from its first convulsion half way through the eighth century of the Christian Era, by the Neoconfucian thinkers Han Yü (*vivebat* A.D. 768-824) and Li Ao (*mortuus circa* A.D. 844);¹ and, after this Neoconfucianism had branched in the eleventh century into two schools that were first differentiated by the brothers Ch'eng Yi (*vivebat* A.D. 1033-1108) and Ch'eng Hao (*vivebat* A.D. 1032-85), the younger brother's 'School of Principles' was carried to its culmination by Chu Hsi (*vivebat* A.D. 1130-1200), while the elder brother's 'School of Mind' culminated in the thought of Wang Shou-jen² (*vivebat* A.D. 1473-1529).³ This Far Eastern Neoconfucianism began and ended⁴ with declarations of dissent from both Taoism and the Mahāyāna. Yet

'we can say that the Neoconfucianists more consistently adhere to the fundamental ideas of Taoism and Buddhism than do the Taoists and Buddhists themselves. They are more Taoistic than the Taoists, and more Buddhist than the Buddhists.'⁵

The channel through which a would-be revival of Confucianism imbibed the spirit of the Mahāyāna was the Ch'an⁶ School of Mahayanian Buddhism, which had struck root on Far Eastern ground in the Early T'ang Age.⁷

"There are three lines of thought that can be traced as the main sources of Neoconfucianism. The first, of course, is Confucianism itself. The second is Buddhism, together with Taoism, via the medium of Ch'anism; for, of all the schools of Buddhism, Ch'anism was the most influential at the time of the formation of Neoconfucianism. To the Neoconfucianists, Ch'anism and Buddhism are synonymous terms, and . . . in one sense Neoconfucianism may be said to be the logical development of Ch'anism. Finally, the third is the Taoist Religion, of which the cosmological views

⁶ A Chinese rendering of the Sanskrit word 'Dhyāna' which, in turn, was rendered as 'Zen' in Japanese (see V. v. 96-103).

⁷ See Fung Yu-lan, *op. cit.*, pp. 255-65.

of the Yin-Yang School¹ formed an important element. The cosmology of the Neoconfucianists is chiefly connected with this line of thought.²

The particular potency of the Ch'an School of Mahayanian philosophy in informing and inspiring a post-Buddhaic Confucian school of Far Eastern thought was due, not merely to the external accident that Ch'anism happened to be in fashion in the Far East at the time when the Neoconfucian Movement was initiated, but also to the fact that an Indic Dhyāna which had struck root on Far Eastern ground had gone a long way, in this new cultural environment, towards adapting its ethics to a Confucian moral climate.

'The most important development in Chinese Buddhism was its attempt to depreciate the Otherworldliness of original Buddhism. This attempt came close to success when the Ch'an masters stated that "in carrying water and chopping firewood, therein lies the wonderful Tao". But . . . they did not push this idea to its logical conclusion by saying that, in serving one's family and the state, therein also lies the wonderful Tao. The reason, of course, is that, once they had said this, their teaching would have ceased to be Buddhism.'³

Yet, while developing this affinity with Confucianism on the ethical plane and thereby qualifying itself to exert an unacknowledged influence on the thought of professedly anti-Buddhist Neoconfucian philosophers, the Ch'an School of the Mahāyāna *in partibus Confucianorum* remained faithful, on the metaphysical plane, to its Mahayanian origins; and, after insinuating itself into Neoconfucianism through an ethical door, it gave this ghost of Confucianism a metaphysical substance which had been lacking in Confucianism in its original authentic form.⁴ 'The Neoconfucianists developed a point of view from which all the moral activities valued by the Confucianists acquire a further value that is "supermoral"';⁵ and, without this infusion of Mahayanian metaphysics through a Ch'an Mahayanian channel, Neoconfucianism might have remained a stranger in its own Far Eastern house; for the impact of the Mahāyāna on a moribund Sinic Society, at a time when the inhabitants of this dissolving world were undergoing the harrowing experience of living through a social interregnum, had produced in their souls a profound and enduring change of spiritual outlook which recalls to the mind of a Western student of History the similar change produced in his own forebears' souls by the impact of Christianity on a moribund Hellenic Society.

'After the revival of Taoism and the introduction of Buddhism, people had become more interested in metaphysical problems and in . . . "super-

¹ See the present Study, II. i. 201-3. The Neoconfucians translated the notion of Yin and Yang into intellectual terms (Forke, A.: *The World-Conception of the Chinese* (London 1925, Probsthain), p. 200).—A.J.T.

² Fung Yu-lan, *op. cit.*, p. 268.

³ *Ibid.*, p. 271. Cp. pp. 264-5.

⁴ Chu Hsi's debt to Mahayanian Buddhist metaphysics is pointed out by Hackmann, H.: *Chinesische Philosophie* (Munich 1927, Reinhardt), pp. 346-7, in a passage cited in this Study in II. i. 202, n. 2. For Chu Hsi's Buddhist solution of the logico-metaphysical problem of the relation between the intellectual unity of an idea (in the Platonic sense of the term) and the multiplicity of its manifestations in the World of Sense, see Fung Yu-lan, *op. cit.*, p. 298.

⁵ Fung Yu-lan, *op. cit.*, p. 280.

moral values", or, as they were then phrased, the problems of the nature and destiny [of Man].¹

The influence on Neoconfucianism of these aspects of the Mahāyāna made itself felt not only in the adoption of the peculiarly Ch'anist theory and practice of 'sudden enlightenment',² but also—at least according to the doctrine of the Neoconfucian 'School of Mind'—in an identification, *more Indico*, of the mind of each individual human being with a Cosmic Intelligence.³

It is true that Neoconfucianism did make some motion to break away from its Mahayanian moorings in the metaphysical sphere, in which the Mahāyāna on Sinic soil had remained true to its original Indic genius, in contrast to its concessions to the Sinic genius in the sphere of Ethics. For example, in prescribing a method of spiritual cultivation, the Neoconfucians departed from Ch'anism by substituting an active 'attentiveness' for a passive 'quiescence' as the requisite state of mind for a neophyte.⁴ Yet attempts, such as this, to recapture the authentic spirit of a Confucianism which these Far Eastern intellectual necromancers had set out to resuscitate were feeble and fitful by comparison with the force and copiousness with which a fountain of Mahayanian Buddhist thought continued to well up through a Neoconfucian conduit-pipe that had been designed to perform the quite different intellectual service of tapping the buried springs of a genuine pre-Buddhist Confucian philosophy; and this captivation of the Neoconfucian philosophical renaissance itself by the spirit of the Mahāyāna made nonsense of the reinstated Confucian imperial civil servants' efforts to reduce the strength of an exotic Mahayanian universal church's hold on the spiritual allegiance of a now politically reunited and socially advancing Far Eastern World.

Even before the reunification of the whole former domain of the Han Empire by Sui Wên-ti in A.D. 589 and the reinauguration of the public examinations in the Confucian Classics by T'ang T'ai Tsung in A.D. 622, the Confucians had seized an opportunity offered to them in the North by their own captivation of the *ci-devant* barbarian To Pa 'Wei' dynasty. In A.D. 446 they had induced the reigning emperor of this house to issue an anti-Buddhist edict;⁵ and they had no sooner acquired a hold upon the government of a resuscitated oecumenical

¹ Ibid., p. 266.

² For the role of 'sudden enlightenment' in Ch'anism, see *ibid.*, pp. 261-2; for its adoption by the Neoconfucian 'School of Principles', see *ibid.*, p. 306. 'Sudden enlightenment' was likewise adopted by 'the School of Mind' (*ibid.*, pp. 307, 308, 309, 310). Other Ch'anist elements in Neoconfucianism are noticed *ibid.*, pp. 272 and 290.

³ See *ibid.*, pp. 309, 312, and 315. In this Neoconfucian identification of individual human selves with a Cosmic Self we may perhaps discern one of the key-ideas of Early Indic thought which had reasserted itself in the Mahāyāna. The Buddha himself rejected by the historical Buddha Siddhārtha Gautama as being the *ātman* was not an acceptance of his own key-doctrine that an individual's self was a mere continuum of intrinsically separate and ephemeral psychological states inauspiciously held together by the sinister force of *Karma* in a complex that could be dissolved and dissipated by going through a prescribed course of spiritual *askēsis* which the Buddha himself had worked out in order to put it within the power of his suffering fellow sentient beings to purge the cumulus of this tormenting *Karma* away.

empire than they began to abuse this power for the purpose of repressing their hated Buddhist rivals. From A.D. 626 onwards, Buddhist monasteries in the T'ang Imperial Crown's dominions were placed under a Confucian official control that grew progressively more severe;¹ and a series of anti-Buddhist memorials addressed to the T'ang Imperial Throne by Confucian high officials—by Fu Yi in A.D. 624,² by Yao Ch'ung in A.D. 713,³ and by Han Yü in A.D. 819⁴—at length produced their cumulative effect in a systematic official persecution, started in A.D. 845,⁵ which, though mild and indeed almost humane compared to many of the persecutions of which a Christian Church was either a victim or a perpetrator, was an exceptionally violent and bloody incident in the less unhappy history of the relations between Church and State in the Far Eastern World.

As it turned out, this Confucian attempt to repress, and if possible eradicate, the Mahāyāna in the Far East was abortive; and, mid-way through the twentieth century of the Christian Era, the Mahāyāna was still a living spiritual force in China as well as in Indo-China, Korea, and Japan. Even, however, if the Mahāyāna, as an institution, had been successfully extirpated in China eleven hundred years before that date, a discreditable political success that would then have been achieved by Confucian civil servants would have been stultified in advance by a then already consummated surrender to the Mahāyāna on the metaphysical plane which did credit to the intellectual integrity of a Neoconfucian School of Far Eastern philosophers. The pioneers of this Buddhistic Neoconfucianism had already set their course on these Mahayanian lines before the Great Persecution of A.D. 845 was launched; and, when a Neoconfucian philosophy that had been duly approved by a Confucian imperial régime had thus taken the Ch'an version of the Mahāyāna to heart, an authentic renaissance of unadulterated Confucianism would still have been as far off as ever if, before the final downfall of the T'ang Dynasty, the Confucian civil servants had succeeded in their efforts to suppress the external manifestations of an exotic higher religion which had now found an inviolable sanctuary and an ideal base of spiritual operations in Neoconfucian bosoms that were both unsuspect and unsuspecting.

When a Zealot-minded Ming Dynasty (*imperabant* A.D. 1368–1644) conferred on Chu Hsi the posthumous canonization that Han Wuti (*imperabat* 140–87 B.C.) had conferred on Confucius, and added the works of this prince of the Neoconfucian 'School of Principles' to the 'set books' prescribed for the official examinations, to serve thenceforth as the sole authorized commentary on the Confucian Classics,⁶ these

Zealots were unconsciously and unintentionally defeating their own purposes by enthroning a thinly disguised Ch'an Buddhism in an authentic Confucianism's never reoccupied place; and, when Wang Shou-jen committed what had now become the political offence of attacking Chu Hsi's version of a Buddhistic Neoconfucian philosophy on behalf of the rival 'School of Mind',¹ one incidental effect of his polemics was to plunge the bows of his own craft deeper than ever into Mahayanian Buddhist waters.

It will be seen that the Neoconfucian philosophers' *odium philosophicum* towards an Indic Mahāyāna was as ironically self-frustrating an essay in the perverse exercise of kicking against the pricks² as the Macedonian legislators' *odium theologicum* towards the would-be Christian legislation of an antecedent Syrian Dynasty;³ and there is a common moral to be drawn from this common failure of two similar attempts, in different provinces of life, to substitute ghosts raised from Sheol for living ideas or institutions. It is all very well for a necromancer to evoke a wraith; but he courts failure if he goes on to try to merge his own identity in the spectral form that he has succeeded in conjuring up; for a phantom is nothing if not transparent; and a creature of flesh and blood that seeks to take cover behind a *revenant* from the world of shades will remain conspicuously visible through the tenuous wisps of this ghastly fancy dress. The shape of the Mahāyāna shows through the shimmer of Neoconfucianism as plainly as the solid substance of the Syrian Emperors' would-be Christian legislation can be discerned beneath the patches of a Justinianean veneer with which its nakedness was partially covered by the Syrians' Macedonian successors.

When we pass from the renaissance of a Sinic Confucian philosophy in Far Eastern history to the renaissance of an Hellenic Aristotelian philosophy in Western Christian history,⁴ we find the plot of the play taking a piquantly different turn on this other stage. Whereas Neoconfucianism succumbed to a Mahāyāna that, in the official view of a Confucian imperial régime, was a trespasser squatting on demesne land to which it could not show any legal title, Neo-Aristotelianism imposed itself on the theology of a Christian Church in whose official view Aristotle—even when the paragon of Medieval Western theologians had fallen into the habit of referring to him as 'the Philosopher' *sans phrase*—nevertheless still remained a son of perdition who was to be kept under mistrustful surveillance on the precarious footing of an enemy alien provisionally permitted to reside within the terrestrial bridgehead of the *Civitas Dei*. In fact, the Hellenic philosopher's ghost captivated a Christian Church that had readmitted this pagan *revenant* on sufferance

¹ See *ibid.*, p. 360, and Fung Yu-lan, *op. cit.*, pp. 308-10.

² Acts ix. 5 and xxvi. 14.

³ See pp. 27-30, above.

⁴ An illuminating account of this Aristotelian intellectual renaissance in Medieval Western Christendom will be found in the following works of the Modern Western scholar C. H. Haskins: *Studies in the History of Mediaeval Science*, 2nd ed. (Cambridge, Mass. 1927, Harvard University Press); *The Renaissance of the Twelfth Century* (Cambridge, Mass. 1927, Harvard University Press); *Studies in Mediaeval Culture* (Oxford 1929, University Press). A psychological question concerning the Andalusian and Sicilian Muslim and the Byzantine Greek Orthodox Christian channels through which a knowledge of Aristotle's philosophical works was acquired by a Western European Christendom is discussed in the present Study on pp. 130-35, below.

into a Western Earthly Paradise after the Church had gained possession of the title deeds, while, conversely, the Sinic philosopher's ghost was captivated by a Mahāyāna on which it had served notice to quit on the strength of title deeds which the Confucians had never let out of their hands. It will be seen that these two otherwise antithetical versions of a ghost-story have one common feature. In either variant of the tale, a party which can claim to have the law on its side is worsted by an opponent who has to rely solely on his merits because, at law, he has no case.

In these at first sight adverse circumstances, a ghostly Neo-Aristotelianism in Western Christendom displayed the same astonishing intellectual potency as a living Mahāyāna in the Far Eastern World.

'It was not [from the Roman tradition] that [Western] Europe derived the critical intelligence and the restless spirit of scientific inquiry which have made [the] Western Civilisation the heir and successor of the Greeks. It is usual to date the coming of this new element from the [Italian] Renaissance and the revival of Greek studies in the fifteenth century, but the real turning-point must be placed three centuries earlier. . . . Already at Paris in the days of Abelard (*vivebat* A.D. 1079-1142) and John of Salisbury (*vivebat circa* A.D. 1115-1180) the passion for dialectic and the spirit of philosophical speculation had begun to transform the intellectual atmosphere of [Western] Christendom; and from that time forward the higher studies were dominated by the technique of logical discussion—the *quaestio* and the public disputation which so largely determined the form of Mediaeval [Western] Philosophy even in its greatest representatives. "Nothing", says Robert of Sorbonne, "is known perfectly which has not been masticated by the teeth of disputation;" and the tendency to submit every question, from the most obvious to the most abstruse, to this process of mastication not only encouraged readiness of wit and exactness of thought but, above all, developed that spirit of criticism and methodic doubt to which Western culture and Modern Science have owed so much.'¹

A ghost of Aristotle that set this abiding impress on the spirit, as well as on the form, of Western thought also produced a passing effect on its substance; and, though the impress here was less durable, it nevertheless went deep enough to require a long and arduous campaign of mental strife as the price of its eventual effacement.

'In [the] whole picture of the Universe [as seen by Medieval Western eyes] there is more of Aristotle than of Christianity. It was the authority of Aristotle and his successors which was responsible even for those features of this teaching which might seem to us to carry something of an ecclesiastical flavour—the hierarchy of heavens, the revolving spheres, the intelligences which moved the planets, the grading of the elements in the order of their nobility and the view that the celestial bodies were composed of an incorruptible fifth essence. Indeed, we may say [that] it was Aristotle rather than Ptolemy who had to be overthrown in the sixteenth century, and it was Aristotle who provided the great obstruction to the Copernican theory.'²

¹ Dawson, Christopher: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), pp. 229-30.

² Butterfield, H.: *The Origins of Modern Science, 1300-1800* (London 1949, Bell), pp. 21-22.

By the seventeenth century of the Christian Era, when the native intellectual genius of the West reasserted itself, in its own characteristically empirical and utilitarian vein,¹ by setting out on a hazardous intellectual pioneering expedition in a carriage-and-pair in which the two steeds yoked in double harness were a technological-minded Natural Science and a scientific-minded Technology, the theology of the Western Christian Church had become so closely entwined with the Aristotelian espalier on which it had been industriously trained by the cumulative labours of twelve generations of Schoolmen that a post-Christian Occidental secular faith's historic martyr, Giordano Bruno, forfeited his life in A.D. 1600 for an intellectual offence which was a flagrant crime of *lèse majesté* against the sovereignty of Aristotle without being explicitly incompatible with Christian theological doctrine.² And, when the Medieval Western Frankenstein's monster whose offended dignity had exacted this sixteenth-century burnt-offering was at last brought to bay by Bruno's scientific successors and avengers,³ Aristotle died as hard in Padua as Jezebel in Jezreel.⁴

'To the Humanists of the [Italian] Renaissance, Padua was an object of particular derision because it was the hotbed of Aristotelianism; and it was one of the paradoxes of the Scientific Revolution that so important a part was played in it by a university in which Aristotle was so much the tradition and for centuries had been so greatly adored.'⁵

Before the seventeenth-century Transalpine Western scientists and philosophers had attacked the Schoolmen for their subservience to 'Aristotle their dictator',⁶ the fifteenth-century Italian Humanists had despised them for their bad Latin; but a ghost of Aristotle which had been raised by the serious-minded heralds of an Early Medieval Western Renaissance of Hellenic philosophy could not be driven out of a Western intellectual arena by such finnikin weapons as the darts, culled from a Ciceronian quiver, that were shot at 'the Philosopher's' heroic wraith by frivolous heralds of a Late Medieval Western Renaissance of the 'classical' Latin and Greek languages and literatures. When, in the course of the seventeenth century, Aristotle's ghost was laid at last in a Western World which this formidable *revenant* had been haunting by that time for not much less than six hundred years, the indignantly recalcitrant spectre did not beat its sullen retreat into the Cimmerian Darkness, from which it had been released for so long a term

¹ See III. iii. 385-6.

² The indiscretion through which Bruno brought on himself a fate that did not overtake Copernicus is explained in Butterfield, *op. cit.*, p. 50.

³ The positive assertion of the existence of a plurality of worlds, which had cost Bruno his life in A.D. 1600, was repeated with impunity in A.D. 1686 by Fontenelle in an *œuvre de vulgarisation*, his *Conversations on the Plurality of Worlds*, which immediately became a 'best seller' (see Bury, J. B.: *The Idea of Progress* (London 1924, Macmillan), pp. 113-15). Yet in the eighth book of *Paradise Lost* Milton did 'not venture to affirm the Copernican system' (Bury, *ibid.*, p. 114), any more than Copernicus himself had ventured to affirm the infinity of the Physical Universe (see Butterfield, *op. cit.*, p. 50), though the date of publication of Milton's poem was only nineteen years earlier than that of Fontenelle's dialogue.

of probation, without enjoying the satisfaction of seeing the crestfallen shades of an ornamental Cicero and an academic Isocrates simultaneously rebanished at the expiry of a very much briefer ticket of leave.

(d) RENAISSANCES OF LANGUAGES AND LITERATURES

A Revenante Literature's Psychological Appeal

When our progressive survey of renaissances carries us into the field of languages and literatures, it confronts us here with an apparent paradox. In this field we meet on the one hand with grotesquely blatant revelations of a vein of pedantry or frivolity, or both, which has caught our eye here and there in our foregoing review of renaissances in the fields of Law and Politics, and which may well be latent in all renaissances as a perhaps inevitable effect of their intrinsic artificiality. On the other hand, this is the field in which the *tours de force* of the cultural necromancer's art win the most enthusiastic acclamation and esteem and are able to count on the most devoted and most uncritical support in setting at defiance the exorcist's salutary summons to an unduly long lingering ghost to return to the nether regions from which it has been conjured up.

The solution of this puzzle is to be found in a feature of the literary and visual 'Fine Arts' that distinguishes them from the social activities of life as well as from Mathematics, Natural Science, and Technology. In the field of the 'Fine Arts' the artist's gift and the critic's taste are independent—to a degree unknown in either of those two other provinces of human culture—of the temporary local circumstances of the historical time and place; and the aesthetic faculties enjoy this unparalleled measure of freedom because they have their roots in the subconscious depths of the Psyche, in whose sight 'a thousand years are but as yesterday when it is past, and as a watch in the night'.¹ The pace of psychic evolution is indeed immeasurably slower in this psychic abyss than on the conscious and volitional surface of the Soul. On the Time-scale of the Subconscious the span of five or six thousand years, counting back from the time of writing, which had seen human societies of the species known as civilizations come and go in a series that had by then already arrived at the third generation, was no more than 'the twinkling of an eye'² in which the hidden light of the 'collective subconscious' human spirit had known 'no variableness, neither shadow of turning'.³

The products of this 'Collective Subconscious' which had been welling up from the depths to the surface of the Psyche in creative works of Literary and Visual Art were thus, in one aspect, virtually eternal, universal, impersonal, and inevitable⁴ by reason of the characteristics of the

¹ Ps. xc. 4. Cp. 2 Pet. iii. 8.

² 1 Cor. xv. 52.

³ Jas. i. 17.

⁴ The word 'virtually' in this sentence perhaps needs underlining, since the appearance of eternity, universality, impersonality, and inevitability which the subconscious abyss of the Human Psyche presented, at its 'collective' depth, to conscious individual human intelligences was, of course, no more than an illusory trick of Relativity. If a human intelligence became capable of viewing 'the Collective Subconscious' with the eyes, not of an individual human being, but of God, it would, no doubt, then become aware that, by comparison with the veritable Absolute, the human 'Collective Sub-

subconscious source from which they sprang, while in another aspect they were also actually ephemeral, parochial, personal, and arbitrary owing to their having to make their epiphanies on the surface of Life at some particular moment in the history of some particular body social, through the action of some individual man or woman who happened to have a genius for giving expression to a *Zeitgeist* in the medium of 'the Primordial Images'.¹

In an earlier context² we have noticed that such expressions of something temporary and local in terms of something lasting and ubiquitous are apt to be so distinctive that the aesthetic test proves to be the surest as well as the subtlest method of ascertaining the limits of a society's extension in the dimensions of Time and Space. Yet this aesthetic monogram which is an almost infallible token for establishing the identity of a social milieu is nevertheless not an intrinsic feature of the body social on whose lineaments it displays itself; it is an arbitrary imprint in the sense that a style of art is not constrained to the same extent as is a system of government or law to reflect the practical exigencies of a particular time and place, while on the other hand it is free from the intellectual servitude which compels a system of Mathematics or Natural Science or Technology to conform to an already acquired and accepted body of knowledge or 'know-how' in order to qualify for finding its

conscious' was a creature of the same parochial and ephemeral kind as the individual human intelligence itself.

The Collective Subconscious's illusory appearance of absoluteness in the individual's intellectual sight was an optical illusion of the same order as the illusory appearance of immobility which a growing plant presents to the physical vision of a human observer. When the growth of a plant has been photographed in a cine-camera with a time-exposure of several weeks' or months' duration, and when a motion that is imperceptible to human eyes in real life has been rendered visible to them on the film by the device of reeling off the tale of weeks and months in so many seconds, it becomes manifest, even to an observer whose powers of vision are limited by the obtuseness of so crude an organ as the human eye, that a plant is in truth no less limber and lithe a living creature than an animal. When the tempo is artificially speeded up on the screen to this degree, the human spectator can watch the roots of a growing plant twisting and turning, like wriggling worms or writhing snakes, as they feel their way round stones and other obstacles in their feverishly eager search for nutriment, while the spectacle of the frantic competitive upward growth of the flowers and grasses under a hedgerow in springtime, and the successive sudden wilting of each competitor when it reaches the limits of its staying power in this struggle for access to a light and an air that are necessities of life, will remind the onlooker of the tragic competition for survival between the human prisoners in the Black Hole of Calcutta. Thus, on the Time-scale of the twinkling of even a human eye, when this Time-scale has been artificially substituted for a normal pace that is of an incommensurably slower order of velocity, the normally apparent distinction between the seeming immobility of a plant and mobility of an animal can be perceived to be illusory; and on this physical analogy we may infer that, in the psychic universe, the corresponding distinction, normally apparent in the mental vision of a human intelligence, between the flux of human life on its conscious and volitional surface and its seeming invariability in its subconscious depths is an illusion which does not cloud the clear sight of an Almighty God.

In the writer's world in his generation, in which 'the Collective Subconscious' was a recent, and therefore an imposing, discovery of a post-Modern Western Science, it was important to be constantly mindful of the truth that the godlike appearance of this deep level of the abyss of the Psyche was no less illusory than the spurious divinity of individual human mannikins of the stature of a Cheops or a Chephren or an Alexander or a Caesar; for, considering the strength and persistence of men's impulse to worship their own latest creations or discoveries, it was to be apprehended that a Twentieth-Century Western Man might mistake a human 'Collective Subconscious' for God (see VII. vii. 514).

¹ For this concept of 'Primordial Images', see the works of C. G. Jung, *passim*.

² In III. iii. 378-80.

place in the cumulatively growing structure of the Human Spirit's 'collective intelligence'.¹ The Fine Arts thus contrive to make the best of both the worlds between which they serve as mediators. Like the voice of the Pythia delivering oracles to Hellas from the Omphalos, they overawe the Conscious Mind and Will by intoning with all the authority of Absolute Necessity, and at the same time delight them by babbling with all the licence of Perfect Freedom. The logically incompatible categories of Necessity and Freedom are, in fact, miraculously reconciled in these oracular artistic intimations of the Primordial Images.

This ambivalent Freedom-in-Necessity or Necessity-in-Freedom, which is the peculiar quality of the Fine Arts and is the secret of the influence that a literature or a visual art is able to exercise over the life of the society in which this art has originally lived and moved and had its being,² makes its magic power felt with a heightened potency in the life of an affiliated society in which the ghost of an antecedent society's art has been conjured up. An aesthetic style that has been arbitrary in one sense even in its original social milieu becomes doubly arbitrary when it is imposed on an alien body social which has already created for itself a native style of its own; yet the exponents of this native aesthetic style which is the haunted society's blazon find the ground give way under their feet when they try to stand up to the spectral trespasser upon their patrimony; for the familiar native style, no less than the uncanny *revenant*, is an arbitrary coinage of the Primordial Images into the aesthetic currency of a particular time and place. A native style of art cannot plead, like a native system of government or law, that it is the only practicable solution of local contemporary social problems; and it cannot plead either, like a current system of Mathematics or Natural Science or Technology, that it is the only rational integration of the sum of knowledge within its field that has been accumulated up to date. When the native art of a haunted society is waging its defensive war against a stalking ghost of the art of an antecedent civilization, it finds itself destitute of Law's or Science's natural defences in the realm of Here and Now, and it is therefore easily driven out of such forward positions into a last ditch in the realm of *Semper et Ubique* where the phantom aggressor is able to contend with the assaulted living art on equal terms.

The issue on which the battle will be decided in this last ditch will be the question which of the two contending arts presents the identical substance of unvarying Primordial Images in an alternative form that better satisfies the abiding and ubiquitous spiritual needs of the souls of men and women, without regard to the local temporary social milieu in which their lot has been cast in their mortal life as individuals; and, on this issue, a live art has no advantage over a ghost; for the accident of the live art's happening to be alive at the moment when the combat is taking place is irrelevant to the determination of the respective merits of the combatants if these merits are being weighed in balances that render their account in terms of eternal and universal values, without being

¹ The respective relations of the Fine Arts and the Mathematical and Natural Sciences to the social milieu are examined further on pp. 697-704, below.

² Acts xvii. 28.

subject to the distorting gravitational pulls of Date or Locality. Under these conditions the odds are even. The ghostly invader has just as good a chance as the living defender of an open city to be awarded the crown of victory by the suffrages of the living generation of the society in whose life the combat is taking place. In the emotional depths of their spiritual experience, in which they are citizens of a Commonwealth of the Subconscious which has likewise been the spiritual home of every other human being who has ever lived—whatever may have been the particular time and place of his conscious volitional life on the surface of human existence—the voters in the forum have no closer affinity and no more compelling obligation to the literature or visual art that they happen to have created for themselves out of the Primordial Images than they have to the arts which their predecessors, in their day, have created out of the same abiding and ubiquitous psychic *kylê*. On the plane of the Subconscious it is incontestably true that *nihil humanum* is *alienum* from any human soul.¹

The considerations which we have just set out will perhaps suffice to explain why it is that *revenantes* literatures and visual arts present such markedly ambivalent appearances and arouse such bitterly violent and stubborn controversies; and we may now pass on from this preface to a review of the facts to which it applies.

The Resuscitation of a Classical Literature in an Anthology, Thesaurus, or Encyclopaedia

A survey of renaissances of languages and literatures that require resuscitation because they are 'dead', and demand it on the score of being 'classical',² is in one respect easier to undertake than our foregoing surveys of those living languages that have served as *lingue franche*³ or as the official languages of universal states⁴ or the liturgical languages of churches,⁵ and than our accompanying surveys of living literatures which have used those living languages as their media. A living language has a life of its own; for it is not only *ex hypothesi* 'a going concern' before the birth of any literature that may eventually employ this living language as its medium; it may also continue thereafter to go its own way in the vocal and audible realm of the tongue and the ear on lines independent of its literary career in the scriben and legible realm of the penman's hand and the reader's eye into which it has now been translated. This original relation between a literature that uses a language and the language that is used by this literature is inverted when the ghosts of the same literature and same language are raised from the dead; for the ghost of a language can haunt the living world only as a parasite on the ghost of a literature which will originally have been an excrescence on the language in the days when the two have both been alive; and therefore, in surveying the renaissances of languages and literatures, we need not, and indeed cannot, deal with the *revenantes* languages apart from the *revenantes*

¹ Terence: *Hautontimorumenus*, Act I, scene 1, line 25.

² An attempt to define the distinctive characteristics of a 'classical' language and literature is made on pp. 705-17, below.

³ See V. vi. 62-83.

⁵ See VI. vii. 253-5.

⁴ See VI. vii. 239-53.

literatures which provide these 'dead' languages with their librettos for catching the eye of the audience of deaf mutes that confronts them when they reappear on the stage of History. Down to the time of writing, the hard labour of recapturing a 'dead' language had seldom been undertaken except for the sake of regaining access to monuments of literature in which this language had been enshrined;¹ and the usual course of a literary renaissance had been a series of steps towards a goal which was not the interpreter's *tour de force* of speaking a dead language as it had originally been spoken, but the scribe's *tour de force* of writing it as it had originally been written.

The first step in this arduous and unpromising enterprise was to retrieve the dead literature's remains; the second step was to remaster their meaning; the third step was to reproduce them in counterfeits which might be mistaken for maliciously adroit parodies if they were not patently inspired by a superstitious reverence for the originals which convicts them of being solemnly clumsy tributes of admiration.² In our survey of renaissances in this field, it will be convenient to follow *gradatim* in the footsteps of the literary necromancers whose procedure is the present object of our curiosity; but, as we investigate the three stages of this procedure in their historical order, it will become evident that they overlap with one another in the Time-dimension, and also that they are distinguished from one another by differences that are not mere corollaries of their chronological sequence.

For instance, when we come to look at the attempts to reproduce a 'classical' literature, we shall find that these imitative works of art, uninspired and uninspiring though they may be, do genuinely have at least one thing in common with their originals. Like these, they are the personal creations of individual human beings, not the mechanically assembled products of collective man-power. On the other hand we shall find team-work counting for more, and individual enterprise for less, in the execution of the preliminary and preparatory tasks of scholarship.

It is true that, here too, we shall meet with culture-heroes who have performed prodigies single-handed. The type is well exemplified in Photius (*vivebat circa* A.D. 820-91), the pioneer Orthodox Christian explorer of an Hellenic literature which, for a nascent Orthodox Christian Society, had been a *terra incognita* during a social interregnum that, on the cultural plane, had held the field continuously for two centuries down to Photius's own generation. The failure of the historical record to name anyone who was Photius's teacher is as eloquent as is its catalogue of his goodly company of pupils.³ His *Library* (*Violiothiki*) or *Host of Books* (*Myrióvivlon*) became a mine of information for later Orthodox

¹ It is true that in the Modern Western World there had been several attempts—which, down to the time of writing, had met with diverse degrees of success—to reanimate a 'dead' language *viva voce* as well as in the visual medium of script. Some of these experiments have been noticed in this Study already in V. vi. 62-71.

² In the realm of the Fine Arts the faculty of *mimêsis* is, of course, a two-edged sword which can be made to serve either as the sincerest form of flattery or as the deadliest form of exposure. The choice between these opposite uses is determined, not by any variation in the nature of the weapon, but by a difference in the temper of its wielder.

³ This point is made by Krumbacher, K.: *Geschichte der Byzantinischen Literatur*, 2nd ed. (Munich 1897, Beck), p. 515.

Christian students of the Hellenic literature, and thereafter for Western students of it in their turn; the actual number of works noticed in this literary digest is 280; and, according to Photius's own account, these were merely the books that happened to have been read, studied, discussed, and appraised in his literary circle during the temporary absence of his brother, to whom the *Library* is dedicated as a *compte rendu* of the transactions in which the absentee had been unable to participate personally. Even if we were to suspect that this dedication was a literary *jeu d'esprit*, and that the contents of the Library represented a larger part of Photius's life-long literary output than the small fraction that they purport to be,¹ the extent of Photius's acquaintance with the Hellenic literature would still remain portentous by comparison with the ignorance of this pioneer scholar's own immediate predecessors.

An independent private scholar of the stature of a Photius is not, however, the characteristic figure in the landscape of a dawning literary renaissance. The pioneer enterprise of reoccupying a long since derelict literary empire is a piece of titan's work that may require the mobilization of a living political empire's organized collective resources; the typical monument of a literary renaissance in its first or second phase is an anthology, thesaurus, corpus, lexicon, or encyclopaedia compiled by a team of scholars at the instance of a prince; and the princely patron of such works of co-operative scholarship as these has, more often than not, been the ruler of a resuscitated universal state that has, itself, been the product of a renaissance on the political plane. Of the five outstandingly eminent representatives of the type who had appeared on the stage of History down to the time of writing—namely, Assurbanipal, Constantine Porphyrogenitus, Yung Lo, K'ang Hsi, and Ch'ien Lung—the last four had all been emperors of *imperia rediviva*.

In the execution of the preliminary task of collecting, editing, annotating, and publishing the surviving works of a 'dead' classical literature, the Far Eastern emperors of a resuscitated Sinic universal state had not only far outdistanced all their competitors up to date but had raised paper monuments whose pyramid-like mass could not easily have been equalled even by the output of a post-Modern Western World with its unprecedented capacity for material production.

It is true that the size of Assurbanipal's two clay libraries of Sumerian and Akkadian classical literature was an unknown and unknowable quantity for the latter-day Western archaeologists who had learnt of the assemblage and dispersal of these two great Assyrian collections by recovering some of the tablets in the course of their excavations on the site of Nineveh; for, within perhaps not more than sixteen years of the royal scholar-criminal's death, the contents of both his libraries had been 'scattered broadcast over the ruins'² of a hateful city that had been stormed, sacked, and devastated in 612 B.C. by the infuriated victims of the last and most atrocious bout of Assyrian militarism.³ Assurbanipal's collection may have been larger than the Confucian Canon of the Sinic

¹ See Krumbacher, *op. cit.*, p. 519.

² Thompson, R. Campbell, in *The Cambridge Ancient History*, vol. iii (Cambridge 1925, University Press), p. 206.

³ See IV. iv. 468-70 and 483-4.

Classics which was, not facily impressed on soft clay, but laboriously engraved on hard stone, at Si Ngan, the imperial capital of the T'ang Dynasty,¹ between A.D. 836 and A.D. 841,² and was printed between A.D. 932 and A.D. 953—during the bout of political anarchy between the extinction of the T'ang and the establishment of the Sung—in an edition which, including the commentary as well as the text, filled 130 volumes.³ Yet we may guess with some confidence that the number of the cuneiform characters contained in Asshurbanipal's collection during the brief period of its existence as a going concern was small by comparison with the number of the Sinic characters contained in the comprehensive collection of works of a Sinic and Sinistic literature which Yung Lo, the third emperor of the Ming Dynasty,⁴ assembled in A.D. 1403-7; for the revised version of Yung Lo's *Ta Tien* ran to no fewer than 22,877 books filling 11,095 volumes, without reckoning in the table of contents.⁵

This gigantic *Corpus Sinicum*, which had required the services of 2,180 or more scholars for the task of selection and transcription,⁶ was beyond the printing capacity⁷ even of a Far Eastern World whose enthusiasm for its Sinic cultural heritage had been reinforced by a Zealot hatred of alien Mongol conquerors⁸ whom the Ming had recently succeeded in expelling from Intramural China; and, according to one account, a set of the *Ta Tien* in manuscript that had become, if it had not always been, unique was eventually destroyed by fire during the fighting in Peking in A.D. 1900 when the Legation Quarter was besieged by 'the Boxers' and relieved by an international expeditionary force.⁹

¹ See VI. vii. 213.

² See Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), p. 132.

³ See Goodrich, op. cit., p. 141. This task was executed by the Hanlin Academy of Letters, which had been founded by the T'ang Emperor Hsüan Tsung on the eve of the troubles of A.D. 755-65, and which survived into the nineteenth century (ibid., p. 132).

⁴ Some of Yung Lo's achievements in other fields have been noticed already in II. ii. 122 and in VI. vii. 264, n. 6.

⁵ See Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), p. 201. The table of contents, running to sixty books, accounts for the discrepancy between the figure of 22,877 books given in *Der Grosse Brockhaus* (Leipzig 1929, Brockhaus, 20 vols.), vol. iv, p. 54, s.v. 'Chinesische Literatur', and the figure of 22,937 given in *The Encyclopaedia Britannica*, 1929, vol. v, p. 573, s.v. 'Chinese Literature'. These figures are derived from the Manchu Emperor Ch'ien Lung's notice of the *Ta Tien* in his catalogue of his own collection. An English translation of this notice by W. F. Meyers will be found in *The China Review*, vol. vi (1877-8), pp. 215-17.

⁶ See Goodrich, ibid. The number is stated to have been 2,169 in the notice of the *Ta Tien* in Ch'ien Lung's catalogue of his own collection, cited in the preceding footnote.

⁷ Though the work could not be printed as a whole, a number of its component parts were printed separately (see Goodrich, ibid.).

⁸ See V. v. 348-52.

⁹ This is the account given in Wilhelm, R.: *Geschichte der Chinesischen Kultur* (Munich 1908, Beck'sche Verlagsbuchhandlung), pp. 40 and 41. According to Goodrich, op. cit., loc. cit., and to *The Encyclopaedia Britannica*, 1929, loc. cit., there had once been three manuscript sets of the complete work. Out of these three sets, only 368 volumes were known to be in existence in A.D. 1949, according to Goodrich, ibid. According to the notice, cited already, in Ch'ien Lung's catalogue of his own collection, one duplicate manuscript set of the *Ta Tien* was made in the years A.D. 1407-9 for the printer's use before the project of printing the *Ta Tien* was abandoned; the whole collection was moved from Nanking to Peking when the imperial capital was transferred thither by Yung Lo in A.D. 1421 (see II. ii. 122); two more manuscript sets were made at Peking in A.D. 1562-7; the two original sets were then sent back to Nanking; but, out of the four, one Peking copy alone survived the disturbances that accompanied the fall of the Ming Dynasty. At the time when the notice in Ch'ien Lung's catalogue was drawn up (i.e. at some date between A.D. 1772 and A.D. 1782), only 2,422 books were missing in this surviving set, out of the original total of 22,937 (including the table of contents). At the date when Meyers was

When the Manchu Emperors K'ang Hsi (*imperabat* A.D. 1662-1722) and Ch'ien Lung (*imperabat* A.D. 1736-96) emulated their Ming predecessor Yung Lo's achievement, they endowed their own collection of the Sinic classical literature with better expectations of life. K'ang Hsi's *K'in Ting Ku Ch'in T'u Shu Chi Ch'êng* ('Compendium of Literature and Illustrations, Ancient and Modern, drawn up under Imperial Authority')¹ was more fortunate than Yung Lo's *Ta Tien* in duly finding its way into print, thanks to the comparative modesty of its compass of 10,000 books in 5,000 volumes (not including a table of contents running to 40 books in 20 volumes) and to the adoption of a suggestion, made by the Jesuit mission in Peking, that a fount of movable metal type should be cast for it as a cheaper alternative method of printing than the cutting of wooden blocks. K'ang Hsi's collection was eventually printed—in a hundred sets according to one account, and in thirty according to another—in A.D. 1726 under the auspices of his successor Yung Chang (*imperabat* A.D. 1723-35).²

The printing *in extenso* of Ch'ien Lung's *Ssu-k'u Ch'üan Shu*³ was out of the question, for this was a collection, not of extracts, like Yung Lo's and K'ang Hsi's, but of complete works⁴ of all genres, which were collected by the imperial officials throughout the Empire in pursuance of a decree issued by Ch'ien Lung in A.D. 1772, and were collated with the materials already assembled in Yung Lo's and K'ang Hsi's collections by an editorial commission appointed in A.D. 1773.⁵ The commission eventually incorporated in the collection, according to one account, 3,511 works in 78,731 books, or, according to another account, 3,460 works in 75,854 books.⁶ The commission also produced an analytical writing (A.D. 1877-8), this copy was still extant in the Hanlin College at Peking, in a building erected there for the housing of imperial collections of literature (see Mayers, *ibid.*, p. 217).

¹ See Mayers, *ibid.*, pp. 218-23.

² 'The editors of the famous encyclopaedia *Ku Ch'in T'u Shu Chi Ch'êng*, whom his father had pardoned for political offences, were put in danger of their lives in order that he might enjoy the cheap satisfaction of having the work brought out under orders of his own choosing, though it was probably already complete' (Goodrich, L. C.: *The Literary Inquisition of Ch'ien-lung* (Baltimore 1935, Waverley Press), p. 21).

³ See Mayers, *ibid.*, pp. 291-9. Goodrich, *op. cit.*, pp. 31 and 36, cites an unprinted essay, on deposit in the library of Columbia University, by Wen-yu Yen, entitled '*Ssu-k'u Ch'üan Shu*, "The Four Treasuries Library" and its Influence upon Chinese Culture' (dated June 1932).

⁴ See Goodrich, *op. cit.*, p. 30; Mayers, *op. cit.*, p. 293.

⁵ 'The same officials who were appointed to invite book-collectors to lend or sell rare texts to the Emperor were likewise required to search out and demand volumes and manuscripts thought inimical to dynastic interests; and . . . for nearly ten years the same officials in Peking who made the selections of books to be copied into *The Four Treasuries* also made note of censorable items and reported them to the Throne.

'Ch'ien Lung . . . for all the munificence of his gifts to literature . . . stands accused before the bar of public opinion for his open interference with the independence of the scholars of his day, for his deliberate falsification of history, for his malice towards a score of authors (several deceased long before) and their descendants, and for his repeated burning of hundreds of books, wood blocks of many of them included . . . a destruction of literary matter which one modern Chinese writer [Wang Kuang-wei in the *Bulletin de l'Institut de l'Université Nationale* (Peking) for the 3rd February, 1926, 17] has no hesitation in classing as second only to the holocaust under Ts'ien Shih Hwang'—Goodrich, L. C.: *The Literary Inquisition of Ch'ien-lung* (Baltimore 1935, Waverley Press), pp. 31 and 36.

⁶ See Mayers, *ibid.*, pp. 297-8 and 295. Mayers considers the larger of these two alternative sets of figures to be the more authoritative. The material taken from the *Yung Lo Ta Tien* consisted of 85 complete works and 284 fragmentary works (Mayers, *ibid.*, p. 298), running to 4,946 books (Mayers, *ibid.*, p. 217).

catalogue, running to 200 books, giving a calendar of works submitted but rejected, as well as one of works included. This catalogue, an abridgement of it, and 147 of the collected works themselves,¹ were eventually printed. The preservation of the collection as a whole was provided for by the multiplication and dispersion of manuscript sets. In addition to the original fair copy, three others were made for official use, and these four were deposited in buildings, specially erected to house them, in the precincts of the Imperial Palace at Peking, at Yüan-ming Yüan, at Jehol, and at Mukden.² Three further complete manuscript sets were deposited in existing libraries at Yangchow, Chinkiang, and Hangchow. The rough copy was presented to the Hanlin Academy. Two manuscript sets of an anthology containing about a third of the complete collection were also lodged in the Imperial Palace at Peking and at Yüan-ming Yüan respectively.

These huge collections of the remains of the Sinic classical literature that were assembled by rulers of a Far Eastern oecumenical empire dwarf the corresponding works of the East Roman Emperor Constantine Porphyrogenitus (*imperabat* A.D. 912–59). Constantine organized the extraction of excerpts, classified under divers heads,³ with the object of thereby making accessible to an intellectually awakening Orthodox Christian Society the cream of an Hellenic classical literature which—even in the shreds and tatters to which its remains had been reduced already by the storm and stress of a post-Hellenic interregnum—was still, in the tenth century of the Christian Era, quite ‘immeasurable’ and ‘unmanageable’ in its bulk⁴ when this was pitted against the narrowly limited receptive powers of an individual human intellect. These Byzantine works of collective scholarship that were produced on Constantine Porphyrogenitus’s initiative and under his auspices shrink into insignificance under the shadow of the mighty works of a Yung Lo and a Ch’ien Lung; and, if the East Roman scholar-emperor could challenge comparison with his giant Far Eastern counterparts on any ground at all, he would have a better prospect of holding his own as an author of original works⁵

¹ See Goodrich, *op. cit.*, p. 148. Mayers, *loc. cit.*, p. 296, gives the number as ‘some 130 in all’.

² See VI. vii. 199, n. 4.

³ i.e. *Diplomatic Missions, Virtues and Vices, Sententious Sayings* (περὶ γνωμῶν), and *Conspiracies against Sovereign Princes*, to mention only the heads under which Constantine Porphyrogenitus is known for a certainty to have made collections of extracts from the Hellenic Classics (see Krumbacher, *op. cit.*, pp. 258–61). Constantine also arranged for the production of new editions of two late Hellenic works of the same character as his own collections: namely, the sixth-century compiler Cassianus Bassus’s *Information about Agriculture* (Γεωπονικά) and the fourth-century compiler Oreibasius’s *Concise Survey of Medical Theories* (Ἐπιτομή τῶν Ἱατρικῶν Θεωρημάτων) (see Krumbacher, *op. cit.*, pp. 261–4).

⁴ Ἐπ’ ἀπειρὸν τε καὶ ἀμήχανον ἡ τῆς ἱστορίας εὐρύνητο συμπλοκή.—Constantine Porphyrogenitus: *περὶ Ἀρετῆς καὶ Κακίας*, Introduction, quoted by Krumbacher, *op. cit.*, pp. 258–9.

⁵ Constantine Porphyrogenitus wrote *An Historical Narration of the Life and Acts of the Emperor Basil* (Ἱστορικὴ Περὶ τοῦ Βασιλέως Βασίλειου ἱστορία) [i.e. the author’s grandfather Basil I (*imperabat* A.D. 867–86), the founder of the Macedonian Dynasty]; *The Administration of the Empire; The Army Corps Districts* (θέματα) *appertaining to the Empire of the Romans and the Origins and Etymologies of their Names, bringing out the distinction between the Names that have been Newly Coined and those that have been Resuscitated from the Ancient Nomenclature*; and *An Exposition and Outline of the Imperial Rules and Regulations* (Ἡ τῆς Βασιλείου Τάξεως Ἐκθεσις τε καὶ Ὑποτύπωσις), labelled *De Caerimoniis Aulae Byzantinae* by Modern Western scholars.

In the foregoing list, the order in which Constantine’s original works have been

than as a 'captain of literary industry' directing and organizing the labours of 'intellectual workers'.¹

The Byzantine scholar-Heraclès who could have looked Ch'ien Lung in the face without being abashed was not the Emperor Constantine Porphyrogenitus but his commoner-namesake and approximate contemporary Constantine Kephalàs, who, without having at his command the resources of an imperial secretariat and an imperial exchequer, succeeded in accomplishing the formidable task of collecting and arranging under subject-headings a vast anthology of the Hellenic poetry written in elegiac verse that had been produced in the course of the twelve or thirteen hundred years ending in the sixth century of the Christian Era. Nor was Kephalàs the only private Byzantine scholar who distinguished himself as a collector of Hellenic poems of this genre. At the turn of the thirteenth and fourteenth centuries he found a worthy successor in Maximos Planoúdis, whose anthology proclaims its independence of Kephalàs' work in its arrangement as well as in its contents.²

When we pass from the preliminary work of collecting and editing a classical literature to the subsequent task of interpreting its meaning, we find Far Eastern scholarship here again putting all competitors into the shade. At least three notable encyclopaedias of Sinic knowledge were compiled during the T'ang régime³ and four during the Sung.⁴ Three of these became classics under the collective title *San T'ung* ('The Three Encyclopaedias').⁵ In the Ming Age, six such works dating from the T'ang and Sung Age were used by Yü Ngan-k'í for the compilation of a thesaurus of literary extracts;⁶ and his work, in its turn, was capped by the Manchu Emperor K'ang Hsi's dictionary of universal reference, *Yuan Kien Lei Hai*, published in A.D. 1710.⁷ The Sung Age had seen the compilation of two notable lexicons, one of which dealt with no less than 53,525 characters.⁸ The *Tsü-Hui*, published in A.D. 1615 at a time when the Ming Dynasty was declining towards its fall, dealt with not more

mentioned is a descending order of originality. The *De Caerimoniis* owes its great historical value to the fact that it is little more than a new edition of an old handbook in which the date and authorship of a number of the earlier component parts are still recognizable. The *De Thematis* likewise draws largely, and in many passages *verbatim*, on previously existing works; but in this case, unfortunately, the sources on which Constantine has chosen to draw are descriptions of the administrative organization of the Late Roman Empire as it was before the great administrative interregnum in the seventh century of the Christian Era, with the result that this disappointing work of Constantine's tells us much less than its title promises about the origin and development of the actual administrative organization, based on army-corps districts, which was the new and distinctive system current in the East Roman Empire (see Krumbacher, *op. cit.*, pp. 253-4). We have noticed in another context (in IV. iv. 342) that the East Roman Empire had been generated by the union of the two army-corps districts of the Anatolici and the Armeniaci with one another and with the imperial city of Constantinople in the eighth century of the Christian Era.

¹ The comparable 'industrialization' of historical scholarship in a post-Modern Western World has been noticed in I. i. 3-8.

² Though Planoúdis left out of his collection many epigrams that Kephalàs had included in his, he also included a number that Kephalàs had left out; and he arranged his own selection on a new plan, under a larger number of heads which he divided into sub-heads (see Krumbacher, *op. cit.*, pp. 727-8).

³ See Goodrich, *op. cit.*, pp. 135-6.

⁷ See Mayers, *ibid.*, pp. 287-8.

⁸ See Goodrich, *op. cit.*, p. 166.

than 33,179 characters but was remarkable for the achievement of arranging these under not more than 214 radicals, in contrast to the 540 that was the lowest figure to which the number had been reduced in any previous analysis.¹ K'ang Hsi (*imperabat* A.D. 1662–1722) organized the production of a lexicon dealing with more than 40,000 characters² (the *K'ang Hsi Tsi-Tien*, published in A.D. 1716) and two concordances (the *P'ei-Wen Yün-Fu*, published in A.D. 1711 in 444 books, with a supplement of 112 books published in A.D. 1716, and the *P'ien-Tsi-Lei-Pien*, published in A.D. 1726 in 240 books) that were designed for the same use as the Modern Western Humanist's *Gradus ad Parnassum*.³ There are corresponding works to the credit of private Byzantine scholars—Photius's lexicon,⁴ Soufthas' encyclopaedia,⁵ and a number of etymological dictionaries of unknown authorship⁶—but, if these Byzantine scholars could have had any inkling of the scale on which K'ang Hsi was to do for the Sinic classics what they were trying to do for the Hellenic classics in the lexicographer's line, there would have been no more spirit in them than there was in the Queen of Sheba when she had seen all Solomon's wisdom.⁷

When we pass from lexicography to criticism and exegesis, Orthodox Christendom can produce one outstanding figure in the person of the twelfth-century scholar-bishop Eustathius, whose commentary on the Homeric poems had proved of lasting value to succeeding Byzantine and Western students down to the time of writing. Eustathius's intellect was no less eminent than his moral character.⁸ But how could one single champion be expected to prove a match for the legion of Western scholars who invaded the field of Hellenic studies in the fifteenth century of the Christian Era, or for the two waves of Far Eastern scholars who made progressive conquests in the field of Sinic studies in the age of the Sung and the age of the Manchu Dynasty?⁹

Critical scholarship in China under the Manchu domination was the child of abortive political endeavours that, in failing, moved the scholar-administrators who had made them to transfer their energies to an intellectual field in which they could count on finding themselves still masters of the situation. In the early decades of the seventeenth century of the Christian Era, when the Ming imperial régime in China was in its death agonies, the Confucian civil servants made two successive attempts—which were as honourable and as unsuccessful as the similar attempts that these latter-day imperial administrators' predecessors had made in the last days of the Posterior Han¹⁰—to save the régime from collapse

¹ See Goodrich, *op. cit.*, p. 205.

² According to *Der Grosse Brockhaus*, 1929, vol. iv, p. 55, the number was 40,545; according to *The Encyclopaedia Britannica*, 1929, vol. v, p. 573, this lexicon ran to 49,000 characters arranged under 214 radicals (like Mei Ying-tso's *Tzû-Hui*).

³ *Der Grosse Brockhaus*, 1929, vol. iv, p. 55. Details will be found in Mayers, *loc. cit.*, pp. 288–91.

⁷ 1 Kings x. 5 and 4.

⁸ In A.D. 1185 even the obscene Western Christian conquerors of Salonica, the Orthodox Christian city that was Eustathius's archiepiscopal see, were unable to resist the spell of this 'schismatic' prelate's saintliness; and, as far as his unfortunate flock did receive any mercy, they owed it to his intrepid intercession on their behalf (see IX. viii. 375, n.3).

⁹ See *Der Grosse Brockhaus*, 1929, vol. iv, p. 55.

¹⁰ See VI. vii. 371, n. 3.

by rescuing it from the hands of the palace eunuchs.¹ Thereafter, when the incurable corruption and incompetence of an effete indigenous dynasty brought extinction upon them and subjugation upon their subjects at the hands of Manchu barbarians, the Confucian litterati once again played an honourable part in the political arena—first by taking their share in an eventually unsuccessful Zealot resistance movement in the South, and then by engaging in an eventually successful manoeuvre to captivate a resuscitated Sinic universal state's Manchu barbarian conquerors by making their own administrative services indispensable to the Empire's new masters.² In this 'cold war' between litterati and barbarians the intellectual attractiveness of the Confucian literary culture was as potent a weapon in the hands of the mandarins as the political utility of the Confucian administrative tradition; and, in this light, the outburst of critical scholarship in China in the seventeenth century may be regarded as a by-product, on the intellectual plane, of a movement of withdrawal-and-return that was to end on the political plane on which it had begun.³

The critical scholarship of the Manchu Age was not an entirely new departure, since the Neoconfucian philosophers of the Sung Age⁴ had already cast doubt on the authenticity of some of the works that had come to be included in the canon of the Classics.⁵ But, if the seventeenth-century and eighteenth-century Confucian scholars were indebted to the twelfth-century and thirteenth-century Neoconfucian philosophers for their critical approach to the Classics, they found their chief stimulus in exercising these awakened critical faculties at the Neoconfucians' expense. After having exposed the Buddhist and Taoist provenance of the Neoconfucians' cosmology, ethics, and psychology, they went on to condemn their scholarship itself as being unscientifically subjective;⁶ and they justified their censoriousness by the exactness and exhaustiveness of their own work on the Sinic classical literature not only in the fields of phonetics, semantics, and textual criticism but in the less pedestrian enterprise of higher criticism as well.⁷

The Counterfeiting of a Resuscitated Classical Literature

When we pass from these preliminary and preparatory tasks of scholarship to the scholar's conceit of producing counterfeits of a classical literature that he is striving to raise from the dead, we must leave it to statisticians to determine whether the number of essays in the Sinic classical style that were produced by candidates for the imperial civil service examinations in China in the course of the 1,283 years that

¹ See Hu Hsih: 'The Chinese Renaissance', in *The China Year Book*, 1924-5 (London N.D., Simpkin Marshall), p. 633.

² See Hu Hsih, *ibid.* p. 634.

³ On this showing, it would appear that the seventeenth-century Chinese scholars who performed such prodigies in the exegesis of the Sinic classical literature were following in the footsteps of Confucius himself and were thereby also taking the same course as the Pleiad of historians—a Thucydides, Xenophon, Josephus, Ollivier, Machiavelli, Polybius, Clarendon, and Ibn Khaldūn—whose auspiciously broken careers we have examined in an earlier context (see III, iii. 248-377).

⁴ See pp. 41-43, above.

⁶ See Hu Hsih, *ibid.*, p. 635.

⁵ See Hu Hsih, *ibid.*, p. 634.

⁷ See Hu Hsih, *ibid.*, pp. 635-6.

elapsed between their reinstitution by T'ang T'ai Tsung in A.D. 622¹ and their abolition in A.D. 1905 in the last days of the Manchu régime was greater or less than the number of exercises in the writing of classical Latin and Greek prose and verse that had been produced by scholars and schoolboys in the Western World between the fifteenth century of the Christian Era and the time of writing. But, whatever might prove to be the answer to this statistical conundrum, it could be predicted that, in a competition in the use of resuscitated classical languages for literary purposes, mere volume of production would not avail to wrest into Chinese or Western hands the palm held by a band of Byzantine historians who found their medium of literary expression in the renaissance of an Attic Greek *κοινή*.

"The authors who brought historiography back to life after the fatal interregnum, extending from the middle of the seventh to the middle of the ninth century of the Christian Era, promptly addressed themselves to the ancient models; and the Age of the Comneni and the Palaeologi brings with it the spectacle of a marked increase in this subservience to [Hellenic] Antiquity. It would be a legitimate generalisation to say that the only substantial difference that distinguishes the [Byzantine] historians of the eleventh to the fifteenth century from the [Late Hellenic] historians of the sixth and seventh centuries is to be found in their respective ways of using a common external medium of exposition. As used by the historians of the Byzantine School, this literary instrument is much more artificial and much more obviously something that has been learnt by rote like a school-boy's lesson. Procopius, Agathias, Menander Protector, Evagrius, and Theophylactus Simocatta may indulge in all kinds of mannerism and apishness, yet they have none of them quite lost their foothold in the living [Greek] speech of the cultivated society of their time, whereas an Anna Comnena studies her Ancient Greek as a foreign language, and this predicament of Anna's is the common embarrassment of all Byzantine historians from the twelfth century onwards. By their time the living [Modern Greek] language had departed so far from Ancient Greek in its morphology, its vocabulary and its syntax that the traditional language of *belles lettres* had come to be no longer even intelligible except at the price of a thorough preparatory grounding in it. This is the sole really generic formal difference that distinguishes the Byzantine historians in the strict sense of the term from the Late Hellenic historians."²

This linguistic and literary make-believe was carried to its preposterous *reductio ad absurdum* by two of the four last cultivators of the genre: a fifteenth-century Athenian Nicholas Khalkokondhýlis who transposed his Christian name into an Hellenic-looking 'Laónikos', and a fifteenth-century Imbrian Kritópoulos who, by a more adroit change of just two letters of the Alphabet,³ coined a likewise Hellenic-looking 'Kritóvoulos' out of a surname that advertised the bearer's Cretan origin. Not content

¹ 'After A.D. 681, the final examination for the highest degree, conducted 262 times during the [period of the] T'ang régime, included: (1) five essays on current events, (2) essays on the Confucian classics and history, (3) an original poem and a composition in rhythmic prose, and (4) special tests covering such topics as Mathematics and Law' (Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), p. 131, n. 18, following A. W. Hummel in *Report of the Librarian of Congress*, 1938, p. 222).

² Krumbacher, op. cit., pp. 226-7.

³ Κρητόπουλος could be transformed into Κριτόβουλος by substituting an ι for an η and a β for a π.

—as an Anna Comnena and a Nikítas Khoniátis had been—with trying to write an Attic *κωμῆ* that might be mistaken by a charitable reader for the language of a Diodorus or a Procopius, the latter-day Athenian aspired to be a second Herodotus, and the latter-day Imbrian to be a second Thucydides; and each of these would-be mimics of the most elusive of all Hellenic originals rashly proclaimed his pretensions in an exordium aping his august ensample's famous opening words—only to fall into solecisms of syntax, vocabulary, and morphology for which a classically educated Modern Western schoolboy would have blushed if he had been convicted of having made such gross mistakes in such countless numbers. Yet the classically educated reader of these Byzantine historians' works whose teeth are set on edge by the stridency of the discord between their pretensions and their performance on the linguistic and literary plane would be guilty of the very frivolity by which these unsuccessful mimics offend him if he were to allow a wanton injury to his aesthetic sensibilities to blind him to the serious merits of the intellectual substance that is masked by an excruciatingly affected linguistic and literary form. A Malvolio-like Kritópoulos or Khalkokondhýlis can challenge comparison with an unpretentious Dhoúkas or Phrantzis when he offers himself for appraisal, not as an author of a work written in Attic or Ionic Greek in the classical Hellenic style, but as a writer of the history of his own time. A Phrantzis and a Khalkokondhýlis in the service of the Palaiológhi, a Dhoúkas in the service of the Gattilusi, and a Kritópoulos in the service of the 'Osmanli all succeeded, from their divers angles of vision, in appreciating and conveying the historic importance of the rise of an Ottoman Power that, in their day, was imposing an alien universal state upon their own Orthodox Christian Society; and a comparable historical insight had been shown by a number of their predecessors.

The first of the series, Léon Dhiakónos, whose work covers the history of seventeen years (A.D. 959–75) ending shortly before the outbreak of the Great Romano-Bulgarian War (*gerebatur* A.D. 977–1019), fully deserved a tribute that had been paid to him by Bury;¹ and, within the span of nearly five hundred years that separates Leo's generation from Kritópoulos's, Leo had a number of notable successors, among whom we may pick out, for mention here,² the Emperor Alexius Comnenus's

¹ 'With the history of Leo Diaconus (Leo Asiaticus) we enter upon a new period of historiography. After an interval of more than three hundred years, he seems to reopen the series which closed with Theophylactus Simocatta. His history . . . is . . . a contemporary work in a good sense, depending on personal knowledge and information derived from living people, not on previous writers' (Bury, J. B., in his edition of Edward Gibbon's *The History of the Decline and Fall of the Roman Empire*, Editio Minor, vol. v (London 1901, Methuen), p. 504).

² In refusing an honourable mention to Léon Dhiakónos's immediate successor Michael Psellos, the writer of this Study was conscious of his temerity in challenging the verdict of a scholar who was far better versed than he was in Medieval Greek literature. In Miss J. M. Hussey's judgement, Psellos's work was so excellent that the highest praise which she could bestow on Leo's was to rate this only one degree lower than the Psellan level. 'Leo's story of the tenth century is almost as delightful as Psellus's of the eleventh, although quite different in style and outlook' (*Church and Learning in the Byzantine Empire, 867–1118* (London 1937, Milford), p. 27). It is different indeed; and, though, by the date at which this note was being written, eighteen years had passed since the writer had had his own experience of reading Leo's history and Psellos's continuation of it one after the other, the passage of time had not taken the edge off the sharpness of

learned daughter Anna (*vivebat* A.D. 1083–*post* 1148), who continued and completed a history of the restoration of the East Roman Empire in her father's generation which had been begun by her husband the Caesar Nikiphóros Vryénnios (*vivebat circa* A.D. 1062–*post* 1137); a Ioánnis Kínnamos who wrote the history of the Comnenan régime during its 'Indian Summer' (A.D. 1118–76); a Nikítas Khoniátis who lived to see and describe the catastrophe of A.D. 1204; and a fourteenth-century Ioánnis Kandakouzínos whose plausible *apologia pro vitâ suâ* could not cover the tracks of the truth that, in usurping the East Roman imperial crown and thereby precipitating a civil war (*saeviebat* A.D. 1341–54), he had opened the way for the 'Osmanlis to leap the Dardanelles and entrench themselves in Rumelia.

The Discomfiture of an Hellenic Ghost by a Western Vernacular Literature

If we now extend our synoptic view of the Far Eastern, Orthodox Christian, and Western renaissances of a classical language and literature to embrace the whole course of each of these three movements from beginning to end, we shall notice that the Far Eastern and the Orthodox Christian renaissance resemble one another and differ alike from the Western renaissance in two respects. In the first place, each of the two non-Western movements succeeded, when once it had got under way, in going forward, not indeed without occasional pauses, but at least without any serious set-backs, whereas the Western literary renaissance that got under way in Italy in the fourteenth and fifteenth centuries had had an eighth-century precursor of Northumbrian origin which had been abortive.¹ In the second place the counter-movement by which each of the two non-Western literary renaissances was eventually overcome was not any domestic reaction against it in favour of the native genius of the civilization which had put itself under a self-imposed ban by conjuring up this ghost of an antecedent society's culture. In the Far Eastern World and Orthodox Christendom, the haunted society never even attempted to exorcize the domineering *revenant*, and was not relieved of its oppressive presence until one masterful alien intruder was expelled by another in the shape of a contemporary Western Civilization which captivated Orthodox Christendom in the course of the seventeenth century, and China at the turn of the nineteenth and twentieth centuries,

the disappointment that he had suffered then in finding Psellos belying his high reputation by showing himself quite destitute of Leo's flair for what is historically interesting and important.

It is true enough that 'scholarship in the eleventh century is often unconsciously considered in terms of Michael Psellus' and that he is 'the most prominent figure of the revival of learning [in Greek Orthodox Christendom] in the eleventh century' (Hussey, *op. cit.*, p. 43); but the conspicuousness of the position which Psellos undoubtedly succeeded in securing for himself in the Hall of Fame certifies nothing beyond his ability to impress Posterity. He achieved this by his facility as a writer; but this very facility convicts him of superficiality in the sight of a reader who measures the felicity of his pen against the jejuneness of his intellect. On this test the present writer inclines towards Krumbacher's harsh judgement on Psellos (Krumbacher, *op. cit.*, p. 435, cited in Hussey, *op. cit.*, pp. 43–44) rather than towards Miss Hussey's more indulgent appreciation of him; and he remains of the opinion that, without prejudice to the question whether Psellos's loss of his academic chair was or was not deserved (see Hussey, *op. cit.*, pp. 65–71), the professor of Hellenic philosophy cannot hold a candle to his predecessor the deacon as a writer of the history of his own times.

¹ This difference has been noticed in IV. iv. 363, with n. 1.

of the Christian Era.¹ By contrast, the Modern Western renaissance of an Hellenic literature represented by the surviving remains of the Greek and Latin Classics was exorcized by the native genius of the Western Civilization, without the help of any alien cultural ally, in a *Kulturkampf* between the respective champions of 'the Ancients' and 'the Moderns' which resulted, before the close of the seventeenth century of the Christian Era, in a decisive victory for an anti-Hellenic 'Counter-Renaissance'.²

The abortive first attempt at a literary renaissance of Hellenism in Western Christendom was coeval with the birth of the Western Christian Civilization itself. The insular prophet of the movement in Northumbria³ was the Venerable Bede of Jarrow (*vivebat* A.D. 673-735); its continental apostle in Carolingia was Alcuin of York (*vivebat* A.D. 735-804);⁴ and, before it was prematurely extinguished by a blast of barbarism from Scandinavia, its exponents had not only begun to revive the Hellenic literary culture in its Latin dress, but had even acquired a smattering of the original Greek.⁵ Alcuin had dared to dream that, in partnership with Charlemagne, he would be able to conjure up a ghost of Athens on the soil of Frankland;⁶ but this Carolingian vision was as fleeting as it was splendid; it had no sooner made this first momentary epiphany than it vanished again without giving its dupes the time to test it; and, when, after a seven-hundred-years-long night-watch,⁷ it was recaptured at last, at the turn of the fourteenth and fifteenth centuries of the Christian Era, by an exultant band of sanguine-minded Italian Humanists,⁸ their longer hold upon it merely served to demonstrate that its fabric was baseless, and that, in persistently clutching at this elusive wraith of Hellenism, *Homo Occidentalis* was courting the poignant frustration that Aeneas brought upon himself when he thrice endeavoured to embrace the shade of Creüsa.⁹

¹ See IX. viii. 182-4 and 324-30.

² This Modern Western cultural civil war has been noticed in IV. iv. 363, with n. 2.

³ An appreciation of this Northumbrian renaissance and a notice of its propagation in the Carolingian Empire will be found in Dawson, Ch.: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), pp. 63-66 and 69-72.

⁴ See Duckett, E. S.: *Alcuin, Friend of Charlemagne* (London 1952, Macmillan).

⁵ The Carolingian Hellenists, such as they were, may have been the Irish Hellenists' teachers. At any rate, the Irish scholars who are known to have had some acquaintance with Greek seem all to have been ninth-century Irish residents in Continental Western Europe (see II. ii. 327, n. 1).

⁶ Alcuin: *Correspondence*, Letter No. 170, addressed to Charlemagne (see Dawson, op. cit., p. 71).

⁷ In a thirteenth-century University of Paris that was given over to the study of the Aristotelian philosophy, the arts and *belles lettres* were despised; and, in a thirteenth-century University of Oxford, Robert Grosseteste and his disciple Roger Bacon studied Ancient Greek (see pp. 133-5, below), not with a view to gaining any wide acquaintance with the Hellenic literature, but solely with an eye to a more accurate understanding of the works of Aristotle and the Scriptures of the Christian Church. This was a revulsion from the aftermath of a Carolingian literary renaissance which had left Western scholars destitute of any source of knowledge beyond the Latin *belles lettres* that had been preserved in the West to serve as textbooks for grammar and rhetoric; but a shift of interest from literature to metaphysics that was so marked in a twelfth-century and thirteenth-century Transalpine Western Christendom had no counterpart in a contemporary Italy, where, as we have seen (on pp. 31-34, above), the academically ablest minds turned in this age to the study, not of the Aristotelian philosophy, but of the Civil and the Canon Law (see Taylor, H. O.: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. ii, pp. 118-21).

⁸ See IV. iv. 275, n. 1, and 363, n. 1.

⁹ Virgil: *Aeneid*, Book II, ll. 792-5.

The illusory semblance of solidity which this phantom displayed at its long-delayed second appearance was so well simulated in its first flush that the pioneers of Humanism might be forgiven, in their day, for flattering themselves that they had been privileged to make Alcuin's noble dream come true; but this sanguine fifteenth-century Italian belief could only have been justified by the event if the Humanists had been right in their underlying assumption that the geni of the western Civilization and Hellenism were two persons of one substance; and this was, indeed, the crucial article of faith in the creed of these Modern Western Hellenists.

In making this assumption the Humanists were simply applying to their own essay in the art of necromancy one of the necessary tenets of the necromancer's ideology. The motive for raising a ghost is to produce some change in the outlook and conduct of the living people whom the ghost is intended to haunt. If the haunted party were to show no sign of being affected by the apparition of the *revenant*, the evocation of this spectre would have been so much labour lost; the measure of the necromancer's success is the degree to which the ghost's intrusion effectually deflects the haunted party from his previous course; but, while the necromancer is thus bound to do his utmost to produce a deflection which will be notable enough to show that he has not exerted himself in vain, he also cannot afford to lay himself open to the charge that he is leading his patient astray from a course which is this wayfarer's high road; for to admit this would be tantamount to confessing that the necromancer's familiar spirit is a misleading will-o'-the-wisp and that the human object of his magical operations is, not his patient, but his victim.

For this reason, every successful necromancer has to justify what he has done by contending that, at the moment when he took it upon himself to raise a ghost from the Past, the living individual or society for whose benefit he professes to have been acting was wandering in the wilderness off the beaten track, and that therefore the magician, when he deflected the wayfarer from his course, was doing him the beneficent service of guiding him back out of a side-track into the highroad. This was the view of their work which the authors of a Modern Western literary renaissance of Hellenism endeavoured to impose on their contemporaries; and the power of the impression that this Late Medieval Italian cultural doctrine was able to make upon the Western tradition is indicated by the confidence with which this fifteenth-century dogma is reasserted in a work, published no less than a quarter of a millennium after the decisive defeat of 'the Ancients' in their seventeenth-century battle with 'the Moderns', by a latter-day Western historian-philosopher who was a contemporary of the writer of this Study.

'Western Civilisation has formed itself by . . . reconstructing' within its own mind the mind of the Hellenic World and developing the wealth of that mind in new directions. Thus Western Civilisation is not related to Hellenic in any merely external way. The relation is an internal one. Western Civilisation expresses, and indeed achieves, its individuality, not by distinguishing itself from Hellenic Civilisation, but by identifying itself therewith.¹

¹ Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), p. 163.

In *The Knights* of Aristophanes, Demosthenes has the happy thought¹ of routing Cleon by enlisting against him a sausage-monger who out-Cleons Cleon and so vanquishes him; and, if we take this cue from an Athenian playwright, our first retort to Collingwood's *ipse dixit*² will be to pit against it one of Spengler's which makes a precisely contrary assertion in terms that are even more magisterial.

'The Renaissance was . . . a rebellion against the spirit of [a] Faustian music, cast in the form of the fugue and breathing the spirit of the woods, which was at that moment on the point of asserting its dictatorship over the whole orchestra of the Western Civilisation's divers forms of self-expression (*über die gesamte Formensprache der abendländischen Kultur*). It [? i.e. the Renaissance] was a logically consistent consequence of the mature Gothic style in which this [Faustian spirit's] will to power had emerged undisguised. It [? i.e. the Renaissance] never attempted to deny either that its genesis was this or that its nature was (as in fact it was) that of a mere counter-movement; and the character of such a counter-movement was bound to be determined from first to last by the contours of the original movement whose negative effect upon the hesitant soul had declared itself in this reaction.

'It is consistent with the origin and nature of the Renaissance that this movement should lack (as it does lack) all genuine depth—and this in the double sense of a shallowness in its ideas and a shallowness in their manifestations. In point of ideas, one need only remind himself of the passionateness of the *abandon* with which the Gothic spirit (*Weltgefühl*) discharged itself over the whole landscape of the Western Culture in order to appreciate the character of the movement that was started, about the year 1420, by a little group of chosen spirits: scholars, artists and humanists. In the outburst of the Gothic spirit, it was a question of "to be or not to be" for a new type of spiritual life (*eines neuen Seelentums*); in the Renaissance it was just a question of taste. The Gothic spirit seizes in its grip the whole of Life, and penetrates into its most secret recesses. It created a new kind of human being and a new kind of world. . . . The Renaissance took possession of a few of the arts, and that was the whole story. It produced no change at all in Western Europe's intellectual outlook or emotional attitude to life. It made itself felt in matters of costume and mannerism without penetrating to the roots of existence. Between Dante and Michael Angelo—both of whom already overstep the Renaissance's chronological limits—this movement cannot muster any representative who can claim to rank as a genius. And, as for the manifestations in which the ideas of the Renaissance expressed themselves, these never gained any hold on the people—no, not even in Florence. In the depths of the people's soul—and this alone makes it possible for us to understand the epiphany of Savonarola and the power, of a wholly different order of potency, that he was able to exert over men's feelings—in the depths of the people's soul the Gothic undercurrent flows serenely along its musical course to its Baroque fulfilment. . . .³

¹ See ll. 141-9.

² In the passage quoted above, Collingwood adopts and asserts, without entering into any argument of the case, a disputable, and in fact long since successfully disputed, view of the rôle of the Italian Renaissance in Western history. The context shows that he has been moved to take up this dogmatic position by a belief that, in the Renaissance of Hellenism, the Western World was doing 'exactly' [*sic*] what is done by 'the historian who studies a civilisation other than his own'. Collingwood's view of the historian's relation to the objects that he studies is examined on pp. 718-37, below.

³ Spengler, O.: *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), pp. 320-1; cp. pp. 591-2.

'The Renaissance is a movement which is both anti-Gothic and antagonistic to the spirit of [Modern Western] instrumental music, and in this role it has an exact counterpart in Hellenic history (*in der Antike*) in a Dionysiac spirit (*Weltgefühl*) which is anti-Doric and at loggerheads with the plastic Apollinean spirit. . . . The great insurrection occurred in Hellas *circa* 700-600 B.C. and in Italy *circa* A.D. 1400-1500. In both cases we are witnessing a war in the soul; a rift in the foundations of the civilisation (*Kultur*) which has found its outward visible expression (*seinen physiognomischen Ausdruck*) in an entire epoch of [the society's] history, and especially in that epoch's universe of artistic forms; a revolt of the soul against its destiny (*Schicksal*), of which it has now taken the measure in its full compass. The recalcitrant forces in the society's bosom—Faust's second soul, which would fain dis sever itself from his other soul—are attempting to do violence to the civilisation's intrinsic spirit; something that is an ineluctable necessity is to be repudiated, rescinded, evaded; the inwardness of the movement is a shrinking from the completion of the society's history in the pre-ordained terms of the Ionic style and of the Baroque style [respectively].

'In Hellenic history this revulsion attaches itself to an orgiastic worship of Dionysus which finds its medium in music and its goal in conjuring away Reality and dissipating corporeal objects (*den Körper vergeudenden*); in Western history it attaches itself to the literary tradition of "Antiquity" and to its cult of the plastic arts, and these two [elements of Hellenic culture] are brought to the rescue in the hope that, through powers of suggestion inherent in antagonistic forms of expression, these alien influences may provide the repressed feeling with a rallying point, may invest it with a pathos of its own, and may thereby obstruct the current which flows in Hellenic history from Homer and the geometric style [of painting] to Pheidias, and flows in Western history from the Gothic cathedrals through Rembrandt to Beethoven.'¹

In these characteristic passages Spengler stigmatizes as an unsuccessful revolt against a manifest destiny the self-same movement that Collingwood commends as the successful fulfilment of a manifest destiny in words that are perhaps no less characteristic of their author's *ethos*. The same dogmatism asserts itself through the piquantly diverse English and German styles of two fine minds whose common foible has brought them into this head-on collision; and, if we were condemned to choose blindfold between one of these two unsupported asseverations and the other, we might find ourselves hard put to it to break the deadlock. As it happens, Collingwood contradicts his own pronouncement, quoted above, in another passage of the same work of his in which he pronounces that the philosophy of the Italian renaissance of Hellenism was as Christian at heart, under an Hellenic mask, as we have found² the Far Eastern Neo-confucian philosophy of the Sung Age to have been Buddhist at heart under a mask of Confucianism.

'In spite of the new interest in Graeco-Roman thought, the Renaissance conception of Man was profoundly different from the Graeco-Roman; and, when a writer like Machiavelli, in the early sixteenth century, expressed his ideas about History in the shape of a commentary on the first ten books of Livy, he was not reinstating Livy's own view of History.

¹ Spengler, O.: *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), p. 321.

² On pp. 41-43, above.

Man, for the Renaissance historian, was not Man as depicted by Ancient Philosophy, controlling his actions and creating his destiny by the work of his intellect, but Man as depicted by Christian thought, a creature of passion and impulse. History thus became the history of human passions, regarded as necessary manifestations of Human Nature.¹

Collingwood's two pronouncements manifestly cancel one another out; yet, since both alike are unsupported assertions, the question which they raise is left still calling for a reasoned answer. Fortunately there are other voices to be heard in this debate; and, if, after listening to them, we find ourselves coming to the conclusion that happens to coincide with Spengler's thesis, this will not be because we have taken the hierophant's oracular dicta on faith; it will be because we have been convinced by the reasoning of soberly empirical-minded historians who have not disdained to argue their case by appealing to the relevant facts.

After having heard Spengler and Collingwood, let us listen to the following critique of the Modern Western literary renaissance of Hellenism from Bury's pen:

'In discarding mediaeval naïveté and superstition, in assuming a freer attitude towards theological authority, and in developing a new conception of the value of individual personality, men looked to the guidance of Greek and Roman thinkers and called up the spirit of the Ancient World to exorcise the ghosts of the Dark Ages. Their minds were thus directed backwards to a past civilisation which, in the ardour of new discovery and in the reaction against Mediaevalism, they enthroned as ideal; and a new authority was set up—the authority of ancient writers. In general speculation the men of the Renaissance followed the tendencies and adopted many of the prejudices of Greek philosophy. Although some great discoveries, with far-reaching, revolutionary consequences, were made in this period, most active minds were engaged in rediscovering, elaborating, criticising and imitating what was old. It was not till the closing years of the Renaissance that speculation began to seek and feel its way towards new points of departure.'²

While Bury thus gives reason for Spengler's characterization of 'the Renaissance' as a revolt against the medieval manifestations of the Western Civilization's native genius, Butterfield enlarges Spengler's *aperçu* of a seventeenth-century counter-revolution against the tyranny of a rebel Renaissance. The eruption of a Baroque visual art and music, which occupies the whole of Spengler's field of vision, is overshadowed in Butterfield's panorama by the eruption of a Late Modern Western Science as this presents itself in the Time-perspective of an observer looking back at it from the chronological vantage-point of a date near the middle of the twentieth century.

'We of the year 1949 . . . are in a position to see [the] implications . . . of the Scientific Revolution . . . much more clearly than the men who flourished fifty or even twenty years before us. . . . The very strength of our conviction that ours was a Graeco-Roman civilisation—the very way in which we allowed the art-historians and the philologists to make us

¹ Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), p. 57.

² Bury, J. B.: *The Idea of Progress* (London 1924, Macmillan), p. 30. Cp. Butterfield, H.: *The Origins of Modern Science, 1300-1800* (London 1949, Bell), p. 162.

think that this thing which we call "the Modern World" was the product of the Renaissance—the inelasticity of our historical concepts, in fact—helped to conceal the radical nature of the changes that had taken place.¹

If, in the light of Butterfield's and Bury's reasoning, we give judgement in favour of the Spenglerian thesis in the issue between Spengler and Collingwood, our verdict will be that, before the close of the seventeenth century, the Western World did exorcize a ghost of Hellenism which it had conjured up some two or three hundred years earlier, but that, before the ghost was laid, this *revenant's* hold upon a living society's imagination had become so strong that another two or three hundred years had to pass before the epigoni of the victors in a seventeenth-century *Kulturkampf* could become fully alive to the truth that Queen Anne was dead.²

The issue between a ghost of Hellenism and the native genius of the Western Civilization had actually been decided before Queen Anne's accession to the throne; for a counter-attack that had been opened cautiously by Bodin (*vivebat* A.D. 1530–96),³ and been carried on more boldly by Bacon (*vivebat* A.D. 1561–1626)⁴ and Descartes (*vivebat* A.D. 1596–1650),⁵ was pressed home to a decisive victory for the living Western culture's cause, and an irretrievable defeat for the Hellenic ghost's, by Fontenelle (*vivebat* A.D. 1657–1757)⁶ in France and William Wotton (*vivebat* A.D. 1666–1727)⁷ in England. The two telling shots to which

¹ Butterfield, *op. cit.*, p. 173.

² The writer of this Study would be guilty of odious ingratitude to Hellenism itself, as well as to the Late Medieval Italian Humanists who raised its ghost to haunt a Modern Western World, if at this point he forbore to acknowledge and confess how thankful he was that one of 'those surprising overlaps and time-lags which so often disguise the direction things are taking' (to quote Butterfield, *ibid.*) had inhibited the arbiters of educational fashions in his own country from laying sacrilegious hands on the humane study of Greek and Latin letters for more than two centuries after this once sacrosanct curriculum had been implicitly condemned, as a logical consequence of the defeat that had overtaken 'the Ancients' in their seventeenth-century contest with 'the Moderns'. Whatever might be the verdict, from other points of view, on the 'classical' education instituted by the fifteenth-century Western Humanists, this was unquestionably the best education conceivable for a Westerner who wanted to be an historian; for a study of *Litterae Humaniores* was the one school of education open to a Westerner in the Modern Age in which he could learn to look at the society into which he happened to have been born with the alien eyes of an outsider whose spiritual home was Hellas, not Hesperia; and, for an historian, no training could be more valuable than this, since the first accomplishment that is required of an historian is an ability to jump clear of his own fortuitous Here and Now.

In having been born just in time to share in this boon, the writer might count himself fortunate indeed, considering that, by the date of his birth, the leaven of Fontenelle's *Digression* had already been working in Western minds for no less than 201 years. Though pedagogues are notorious for being arch-conservatives, even they do eventually respond to influences that have been in the ascendant for a very long time in the rest of the body social, and in England the bastions of a traditional Late Medieval Italian system of education in the Greek and Latin Classics at last duly began to crumble under the fire of Fontenelle's seventeenth-century batteries only a few years after the present writer's fifteen-years-long education in Latin and twelve-years-long education in Greek had been safely completed in A.D. 1911. In later life he thanked his stars for having permitted him to be so *felix opportunitate natus*.

³ See Bury, J. B.: *The Idea of Progress* (London 1924, Macmillan), p. 43. In the precise form of a comparison of merits, the controversy opened in Italy in A.D. 1620, and in France in A.D. 1635 (see *ibid.*, pp. 80–1).

⁴ See *ibid.*, pp. 53–56.

⁵ See *ibid.*, pp. 67–69. 'He was proud of having forgotten the Greek which he had learnt as a boy. The inspiration of his work was the idea of breaking sharply with the Past, and constructing a system which borrows nothing from the dead.'

⁶ See *ibid.*, pp. 98–126.

⁷ See *ibid.*, pp. 119–23.

'the Ancients' had finally succumbed had been Fontenelle's *Une Digression sur les Anciens et les Modernes* (editum A.D. 1688)¹ and William Wotton's *Reflections upon Ancient and Modern Learning* (editum A.D. 1694). Sir William Temple had played into Fontenelle's hands when he had attempted to answer the *Digression* in 'An Essay upon the Ancient and Modern Learning' which he had published in A.D. 1690 in the second volume of his *Miscellanea*; for he had not only provoked Wotton's able rejoinder but had brought his own cause into derision by rashly declaring his belief in the authenticity of the spurious *Epistles of Phalaris* and thereby drawing an annihilating broadside from a classical scholar of the calibre of Richard Bentley. Temple had not succeeded in rehabilitating himself in 'Some Thoughts upon Reviewing the Essay of Ancient and Modern Learning';² but his discomfiture had evoked the one immortal work indited in the course of this seventeenth-century controversy; for it had moved the hard-pressed scholar-statesman's brilliant protégé Jonathan Swift to come to his patron's support by writing in A.D. 1697 *The Battle of the Books* (editum A.D. 1704).

In this cultural civil war, whose outcome carried the Western Civilization out of an Early Modern into a Late Modern chapter of its history, one of the signs of the times was the publication at Rotterdam, in A.D. 1695-7, of Pierre Bayle's *Dictionnaire Historique et Critique*; for Bayle, the *déraciné* Southern French Protestant who had found his congenial second home at the meeting-point of an expanding Western World's oceanic and inland waterways at Rotterdam, was one of the prophets of a Rationalism which was a revulsion from the Wars of Religion,³ and one of the founding fathers of a 'Republic of Letters' which was a secular substitute for a lost Medieval Western *Respublica Christiana*,⁴ while Bayle's dictionary was the parent of Diderot's and d'Alembert's *Encyclopédie* (editum A.D. 1751-65)⁵ and thus the grandparent of all subsequent Western works of co-operative intellectual engineering⁶ whose promoters acknowledged their debt to the mother of Modern Western encyclopaedias by converting its title into a generic name for a line of literary production.

Dictionaries and encyclopaedias were not, of course, trophies of Late Modern Western Man's versatile inventive genius. They had been invented in a disintegrating Hellenic World in its post-Diocletianic Age

¹ 'La Lecture des Anciens a dissipé l'ignorance et la barbarie des siècles précédents, je le crois bien. Elle nous rendit tout d'un coup des idées du Vrai et du Beau que nous aurions été longtemps à rattraper, mais que nous eussions rattrapées à la fin sans le secours des Grecs et des Latins si nous les avions bien cherchées. Et où les eussions-nous prises ? Où les avoient prises les Anciens. Les Anciens mêmes, avant que de les prendre, tâtonnèrent bien longtemps. . . Si l'on nous avoit mis en leur place, nous aurions inventé; s'ils étoient en la nôtre, ils ajouteroient à ce qu'ils trouveroient inventé; il n'y a pas là grand mystère' (Fontenelle, B. le Bovier de (vivebat A.D. 1657-1757): *Poésies Pastorales, avec un Traité sur la Nature de l'Eglogue et une Digression sur les Anciens et les Modernes*, 4th ed. (Amsterdam 1716, Etienne Roger), pp. 147 and 138).

and in a disintegrating Sinic World in the Age of the Posterior Han as strong-boxes for preserving an accumulated cultural wealth that was under threat of being lost through oblivion, and they had been revived, as we have seen,¹ in Orthodox Christendom and in the Far East as a first step towards recovering command of the buried treasures of an antecedent culture with a view to eventually bringing them back into circulation out of these golden treasuries. In sheer physical bulk, the monuments of a Far Eastern encyclopaedism dwarfed the most imposing structures of the kind that the technological resources of the Modern West had been able to produce down to the time of writing, as royally as the Pyramids at Gīzah dwarfed the 'sky-scrapers' on Manhattan Island. The novelty of the Late Modern Western encyclopaedias lay, not in their structure or in their scale, but in their purpose and in their spirit; for, in stealing this weapon from the armoury of a post-Diocletianic Hellenism, the Western champions of 'the Moderns' against 'the Ancients' in a seventeenth-century Western *Kulturkampf* were employing it neither for the preservation nor for the resuscitation of a 'dead' culture but for the assertion of a living culture's pretensions to be worth more than its predecessor's ghost.

The successive encyclopaedias that were published and republished, on an ever larger scale and at ever shorter intervals, in a Late Modern Western World from A.D. 1695 onwards, were so many manifestos giving notice of the Westerners' claim to have outstripped the wisdom of the Hellenes, and so many *comptes rendus* of the progress achieved by Western mental pioneers in virgin fields of knowledge, thought, and understanding. In the intellectual field of Mathematics, Natural Science, and Technology, which was the realm of an Impersonal Collective Consciousness, these self-confident Late Modern Westerners might prove in retrospect to have been justified in their belief that they had made original and momentous contributions to the cumulative wealth of Mankind. In aesthetic, moral, and religious fields in which a Collective Intellect's privilege of earning compound interest was denied to the seekers after spiritual treasure, and in which every society, and indeed every individual human being, was therefore forced to begin afresh Man's perennial search for the Pearl of Great Price,² Time alone would show whether an Occidental Faust was an any more acceptable candidate for God's grace than an Hellenic Prometheus. Meanwhile, one thing was certain; and this was that before the close of the seventeenth century of the Christian Era a living and lively Western World had given a dead Hellenism's imperious ghost an unequivocally clear notice to quit.

Can we put our finger on any distinctive feature in the linguistic and literary renaissance of an antecedent civilization in the history of the Western World that might account for the Westerners' success in eventually shaking off this cultural incubus by their own unaided efforts, when this feat proved to be beyond the strength of both the Greek Orthodox Christians and the Chinese? We shall find at any rate one clue in the contrast, which we have noticed already,³ between the spasmodic course

¹ On pp. 57-58, above.

² Matt. xiii. 45-46.

³ On pp. 62-63, above.

of the linguistic and literary renaissance of Hellenism in the West and the uninterrupted progress of the corresponding renaissances in Greek Orthodox Christendom and in China; for the interruptions of the importunate activity of a ghost of the Hellenic culture in the West were so many opportunities for an original literature in the living vernacular languages of the Western peoples to spring up too high to be overshadowed, and strike root too deeply to be overthrown, when a temporarily banished spectre returned to try once again to captivate the Western World after a spell of quiescence following the failure of its first attempt. The new native Western poetry in the vulgar tongue had discarded an Hellenic mode of versification based on the quantitative value of syllables in favour of a mode, based on the accentuation of words, which was the natural mode for poetry in the living Romance¹ and Teutonic languages of the Western Christian peoples; and this native Western accentual verse had been enriched by the adoption of a contemporary Arabic poetry's device of rhyme, which was alien to the literary tradition of the Hellenic World and Western Christendom alike.² Yet, revolutionary as this Western new departure was, its triumph was portended in the success of the rhymed accentual Provençal poetry of the troubadours, and was assured when Dante made his historic decision to indite his *Divina Commedia*, not in Latin hexameters, but in rhymed accentual poetry in which he correctly took the troubadours' cue by using as his linguistic medium, not the troubadours' Provençal, but a Tuscan that was his own mother tongue.

It is true that the moral courage and aesthetic imagination here displayed by Dante had their counterparts, in the history of another civilization, in Ikhnaton's decision to discard, in favour of a living New Egyptian language, the long since dead Classical Egyptian which, down to Ikhnaton's day, had continued to be the obligatory medium of literary expression in the Egyptiac World because once, some 1,500 years before Ikhnaton's generation, this had been the living language of that world in the Age of 'the Old Kingdom'. It is also significant that, of all the sweeping reforms that Ikhnaton tried to impose upon the Egyptiac Society of his day, this linguistic reform alone survived his death.³ Yet

¹ The natural bent of the Romance languages towards accentual, as opposed to quantitative, verse was part of their heritage from Latin. The 'Saturnian' verse of the oldest surviving specimens of Latin literature had been based on accent, not on quantity; and, although part of the price of the Romans' 'reception' of the Hellenic culture had been the banishment of this pristine native mode of Latin verse from the 'high-brow' Hellenizing Latin poetry of the Classical Age, the constriction of so strongly accented a language as Latin in the strait-waistcoat of a quantitative verse, reflecting the alien genius of Ancient Greek, could never—even in a Virgil's masterly hands—be anything but a *tour de force*. The unnaturalness of this imposition of an Ancient Greek prosody upon a Latin linguistic medium received its conclusive exposure when, some four centuries after the 'Saturnian' mode of versification had been driven off the field, an accentual prosody reasserted itself in a Christian Latin popular poetry produced by poets who were more keenly concerned to express themselves in a way that would be congenial to their public than they were to uphold any exotic literary canon.

² While a Medieval Western vernacular poetry adopted from a contemporary Arabic poetry the device of rhyme, which could be applied to accentual verse as readily as to quantitative, it is noteworthy that the Medieval Western vernacular poets were not inveigled by their admiration for their Arabic models into doing violence to the genius of their own mother tongues by going on to borrow from the Arabic a quantitative basis of versification which was common to the Arabic school and the Hellenic.

³ See V. v. 496, and cp. IV. iv. 413.

these points in common between Ikhnaton's act and Dante's bring out all the more sharply the contrast between the respective relations in which these two men of genius stood to their social milieux.

Ikhnaton was spiritually at war with the *éthos* of the Past-ridden society into which he had been born; and, in this milieu, the weight of the incubus was so crushingly heavy that a would-be saviour of society could not afford to compromise. If he was to win any relief from pressure for his contemporaries and for Posterity, he could only hope to succeed by rejecting the Past *in toto*. By contrast, Dante was not faced with this desperate choice between two extreme alternatives. Living, as he had the good fortune to live, in an age of Western history in which the pressure of a resurgent Hellenism happened to be down in the trough between the sundered crests of a Carolingian wave that had already receded and a Medicean wave that was still beyond a fourteenth-century Florentine poet's temporal horizon, Dante was able to achieve his life-work as an exponent of the *Zeitgeist* instead of being forced, as Ikhnaton found himself forced, to resort to the hazardous *ultima ratio* of declaring war on it. Dante was able to express the spirit of his world and age by combining the cultivation of a vernacular poetry with a cult for a resuscitated Hellenic cultural past. He contrived—and this without strain, because without selfconsciousness—to be the exponent of a renaissance and of a new life simultaneously. And his ability to achieve this magically creative harmony was at least partly due to the auspicious fact that, in the Italy of his age, at the turn of the thirteenth and fourteenth centuries of the Christian Era, the influence of a resuscitated Hellenic culture was not overwhelmingly potent.

The impotence of this ghost to stifle the growth of a new and original culture that was springing up under its shadow is revealed in the success with which the living creature turned the tables on the *revenant* from a dead world; for in this case the spectre was dexterously captivated by its intended victim. When we examine the poetry composed in Latin in Western Christendom from the turn of the eleventh and twelfth centuries onward, we hear the accents of Jacob's voice while we are feeling the hands of Esau.¹ This medieval Latin poetry, as it was written from the twelfth century to the fifteenth, may be described not inaptly as vernacular poetry masquerading in a Latin dress. Though the words are Latin, the rhythm, rhyme, sentiment, and *je-ne-sais-quoi* of this ostensibly Latin poetry have all been breathed into it by the creative spirit of a contemporary Western literature in the vulgar tongue²—as Man became a living soul when the breath of life was breathed by the Lord God into a receptacle that he had formed of the dust of the ground.³ And, when fifteenth-century Italian Humanists, in their injudiciously pedantic enthusiasm for a genuinely Hellenic article, proved clever enough to

¹ Gen. xxvii. 22.

² On this point see H. O. Taylor: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. ii, p. 154. In this connexion it is significant that the quarter of Western Christendom in which the finest works of Medieval Latin poetry were produced was a region lying to the north of the Loire, in what had been the north-western fringes of an Hellenic World of the Imperial Age, and not any of the Romance-speaking countries adjoining a Mediterranean Sea that had once been the Roman Empire's *mare nostrum* (see *ibid.*, p. 122).

³ Gen. ii. 7.

write classical Latin quantitative verse that might occasionally pass for the work of a Lucan or even an Ovid, they merely succeeded in killing a vernacular poetry in Latin fancy dress without ever coming within sight of their ulterior objective of installing a resuscitated literature in the classical Latin and Greek idiom and vein in the place of a long since securely established vernacular poetry in the unaffected medium of the vulgar tongue. The Humanists' revival of the art of writing quantitative Latin and Greek verse in a correct Hellenic style was followed, not by an eclipse of a native Western literature that was flying its own proper colours unabashed, but by a fresh outburst of it in a blaze which effectively took the shine out of the Humanists' frigid academic exercises.

The Discomfiture of an Orthodox Christian Greek Vernacular Literature by an Hellenic Ghost

The spontaneously generated native literature in the vulgar tongue which came to this fine flower in a Western World had its counterparts in a Greek Orthodox Christendom and in the Chinese main body of a Far Eastern Society; but here the seed fell among the thorns of the resuscitated language and literature of an antecedent civilization,¹ 'and the thorns sprang up with it, and choked it'.²

The Modern Greek language resembled Latin and Latin's Romance offspring, and differed, like them, from Ancient Greek, in being accentual and not quantitative, and it duly found for itself a congenial form of accentual versification—the so-called 'Metropolitan³ Metre'—which was as alien in its technique from the Ancient Greek quantitative verse of a Homer or a Theognis as the contemporary accentual verse of Western Christendom was from the Latin quantitative verse of Homer's imitator Virgil or Theognis' imitator Ovid. As we have seen in another context,⁴ this Modern Greek accentual verse provided the literary vehicle for a tenth-century epic poem celebrating the exploits of the Greek borderers in an East Anatolian no-man's-land beyond the Antitauran frontier of the 'Abbasid Caliphate; and this Byzantine Greek Epic of Basil Digénis (Dhiyénis) Akritas was thus, on both the literary and the social plane,⁵ a true counterpart of the *Chanson de Roland*. Yet, whereas an eleventh-century *Chanson de Roland* was able to become the parent of a vernacular literature, in all the living languages of the Western World,⁶ which was still bearing fruit nine hundred years later, the tenth-century Byzantine Greek Epic was cheated out of its manifest destiny through being sterilized by the triumph of a Greek Orthodox Christian renaissance of the Ancient Greek language and literature;⁷ and, though the living Modern Greek language and its native accentual style of versification were emboldened, thereafter, to reassert themselves by the example of a Medieval Western vernacular literature which made its influence felt

¹ The successive vicissitudes in the history of an Orthodox Christian Greek literature, from its emergence during a post-Hellenic cultural interregnum down to the twentieth century, can be studied in the life in Trypánis, C. A.: *Medieval and Modern Greek Poetry, An Anthology* (Oxford 1951, Clarendon Press).

in Greek Orthodox Christendom as a consequence of the ascendancy which the Franks progressively established over the Greeks from the close of the eleventh century onwards,¹ the price of this Frankish cultural assistance in revolting against an Hellenic cultural tyranny was the heavy one of being constrained to submit to a mere change of masters instead of recovering a lost cultural liberty. In Crete, where the Medieval Greek vernacular literature went farther, because the Medieval Frankish ascendancy here lasted longer, than in any other province of Greek Orthodox Christendom except the Ionian Islands, it flourished in virtue of resigning itself to becoming a version, in the Modern Greek language, of the contemporary literature of the West, while the Italianate Greek Orthodox Christian Ionian Islanders came to find it easier to make contributions to a Western literature in its native Italian medium than to transpose their literary compositions into their own Modern Greek mother tongue.²

It might perhaps have been expected that, after the Greek Orthodox Christians' feelings towards the West had changed, as they did change in the seventeenth century,³ from contempt and hostility to admiration and receptivity, and after this revulsion had culminated, as it did culminate in the nineteenth century, in a resolve, on the Greek people's part, to become naturalized members of the Western Society of the day without any lingering Byzantine xenophobe reservations, one of the first fruits of this process of cultural conversion would have been the liberation of the Modern Greek language from the dead hand of a Hellenism that had been resuscitated in Greek Orthodox Christendom before the beginning of this Christian civilization's long and momentous encounter with a sister Christian society. Unhappily for the Greeks, the Western Society with which they threw in their lot in the nineteenth century was by then already infected with the spiritual malady of Nationalism, which had been engendered in the Western World by the impact of a Classical Hellenic ideal of political parochialism⁴ on the Western World's parochially variegated linguistic map. It was not surprising that the nineteenth-century Greek proselytes to the altar of a Modern Western culture should succumb to this Modern Western Nationalism and should develop the linguistic symptoms that were characteristic of this cultural disease; but it was unfortunate that, in adopting a Western-minded linguistic Nationalism, the Modern Greeks should have elected to combine this, as they did, with a Byzantine-minded linguistic Archaism.

Instead of learning, as they might have learnt, from the troubadours and Dante the invaluable lesson that the poetry of the West had come to flower so finely just because the poets of the West had not been ashamed of their living mother tongues, the nineteenth-century Greek Orthodox Christian converts to a contemporary Western culture were obsessed by a haunting consciousness that the Modern Greek language was lineally descended from the Ancient Greek and that their ancestral Orthodox Christian Civilization was affiliated to the Hellenic; and these irrelevant historical facts imposed upon them so imperiously that, in their lin-

² See IX. viii. 679-80.

⁴ See pp. 7-8, above.

guistic policy, they dared not live up to the ideals of the Western cultural faith to which they had formally declared their allegiance. They could not summon up the moral courage to take their own language as they found it and to rely on their own literary genius to fashion this language into a worthy instrument for conveying whatever they might prove to have it in them to express. They chose the untoward alternative course of taking refuge in the cultivation of a linguistic Archaism; and, though they refrained from carrying this folly to the lengths to which it had been carried by Byzantines who on paper had discarded their living Modern Greek mother tongue altogether in favour of an artificially resuscitated Attic,¹ the nineteenth-century Westernizing Greeks did the next worst thing when, like callous manufacturers of *foie gras*, they set themselves to denature their mother tongue by grouting into it as gross an infusion of the Attic Greek vocabulary, inflexion, and syntax as they could compel a tortured living language to swallow.²

Thus, on the linguistic and literary plane, the Greeks' 'reception' of a Modern Western culture, whose distinctive gift was to use living vernaculars as its literary vehicles, had the paradoxical result of fettering a living Greek language instead of liberating it.

The Sinic Classical Incubus on a Chinese Vernacular Literature

In the Chinese heart of a Far Eastern World, as in Greek Orthodox Christendom, a popular literature in the living vulgar tongue had succeeded in springing up, under the shadow of an antecedent culture's classical language and literature, before an expanding Western Civilization had appeared on the scene. A living 'mandarin' *lingua franca*³ had become a vehicle not only for folk-songs⁴ but also for drama since the thirteenth century of the Christian Era,⁵ and for novels in the sixteenth, seventeenth, and eighteenth centuries.⁶ In China, again, the same

¹ See pp. 73-74, above.

² This Modern Greek linguistic and literary Archaism and the *Kulturkampf* to which it gave rise have been noticed in V. vi. 68-70. Though the anti-archaistic movement in favour of the living language was abortive, it managed to keep the field in just sufficient strength to condemn a politically reunited Modern Greek people to live in a state of chronic cultural schism between the respective adherents of the *καθαρεύουσα* and the *δημοτική*. Either school of Modern Greek linguistic dogmatism could sit on its own behalf the authority of a Modern Western dogma, but the *δημοτική* law for Modern Greeks of both schools alike. The *δημοτική* answered to a Modern Western dogma, begotten by a sixteenth-century Protestant Reformation, that a national language ought to be 'understanded of the people'; the *καθαρεύουσα* answered to another Modern Western dogma, begotten by a nineteenth-century Romantic Movement, that a national language ought to have roots in the national past. In the native social milieu of the Western Society in which this pair of dogmas had originated, they did not conflict; for the local Western vernaculars—Italian, French, English, Dutch, German, and the rest—answered to both dogmas alike, in opposition to a Latin that had been the linguistic vehicle of a Western chrysalis-church. When, however, the same two dogmas were applied in the alien social milieu of a Modern Greek Orthodox Christian community which had 'received' the Modern Western culture by an act of conversion, the two dogmas here proved irreconcilable owing to the success previously achieved by a Byzantine renaissance of a dead Attic Greek in blighting the literary cultivation of the living Modern Greek language in an earlier chapter of Modern Greek cultural history.

negative, unintentional, and unconscious, yet none the less valuable, literary service had been performed by Mongol invaders as had been performed in Greek Orthodox Christendom by the Frankish conquerors of an East Roman Empire. Here, as there, an irruption of militant barbarians had been a cultural and social as well as a political and military catastrophe; here, as there, it had hit a small highly cultivated official class more severely than it had hit the uncultivated merchants, artisans, and peasantry;¹ here, as there, the shock dealt to this classically educated officialdom had broken 'the cake of custom'² which this governing class had imposed on the lower strata of society; and, since, in a resuscitated Sinic and a resuscitated Hellenic universal state alike, the linguistic and literary custom hitherto upheld by the now crestfallen pandits had been the cult of a dead classical language and literature at the expense of a living vulgar tongue and the popular literature conveyed in it, the cultural effect, in China as in Greek Orthodox Christendom, was to liberate this popular literature from the incubus of a classical ideal and thereby give it a chance to invigorate itself by gaining access to the air and to the light.

While the Chinese popular literature had the same history as its Modern Greek counterpart in these respects, it gave proof of a greater vitality by emulating the Medieval Western vernacular literature's feat of 'haunting the haunter'. As Hu Shih tells the story of how his own eyes were opened:

'I found that the history of Chinese literature consisted of two parallel movements: there was the classical literature of the scholars, the men of letters, the poets of the imperial courts, and of the *élite*; but there was in every age an undercurrent of literary development among the common people which produced the folk songs of love and heroism, the songs of the dancer, the epic stories of the street reciter, the drama of the village theatre and, most important of all, the novels. I found that every new form, every innovation in literature, had come never from the imitative classical writers of the upper classes, but always from the unlettered class of the country-side, the village inn and the market-place. I found that it was always these new forms and patterns of the common people that, from time to time, furnished the new blood and fresh vigour to the literature of the literati, and rescued it from the perpetual danger of fossilisation. All the great periods of Chinese Literature were those when the master minds of the age were attracted by these new literary forms of the people and produced their best works, not only in the new patterns, but in close imitation of the fresh and simple language of the people. And such great epochs died away only when those new forms from the people had again

¹ After the sack of Constantinople by the Crusaders in A.D. 1204, some of the previously well-to-do Greek refugees from the sacked city were ill-treated by the Greek rural population in the hinterland, who forcibly relieved them of the money that they had been able to bring away with them, and gloated over the spectacle of grandees reduced to an equality with themselves on a common level of destitution. The poorer Greek inhabitants of Constantinople, who did not take flight, enriched themselves by buying from the Latin conquerors, at derisory prices, valuable articles of property that the Latins had plundered from the Greek purchasers' wealthy fellow-citizens (see the indignant comments on these proceedings in Nikitas Khoniátis' *Khroniki Dhitiyisis*, Epilogue on the Aftermath of the Catastrophe, chap. 5, on pp. 784-5 of I. Bekker's edition (Bonn 1835, Weber)).

² Bagehot, W.: *Physics and Politics*, 10th ed. (London 1894, Kegan Paul), pp. 27 and 35, quoted in II. i. 192.

become fixed and fossilised through long periods of slavish imitation by the uncreative litterati. . . .

'It was the anonymous folk songs of Antiquity that formed the bulk of the great *Book of Poetry* and created the first epoch of Chinese Literature. It was again the anonymous folk songs of the people that gave the form and the inspiration in the developments of the new poetry in the Three Kingdoms and later in the T'ang Dynasty. It was the songs of the dancing and singing girls that began the new era of *ts'ü* or songs in the Sung Dynasty. It was the people that first produced the plays which led to the great dramas of the Mongol period and the Mings. It was the street reciters of epic stories that gave rise to the great novels, some of which have been "best sellers" for three or four centuries.'

Yet, in striking contrast to the attitude of a Dante, a Petrarch, or a Boccaccio, the Chinese literary artists who owed so much to artless masterpieces in the vulgar tongue, and who turned their borrowed talent to such good account,² were as anxious to hide their light under a bushel³ as if they had to fear the pains and penalties of failing to conform to some rigidly imposed cultural 'black-out'. 'They were so ashamed of what they had done that many of the earlier novelists published their works anonymously or under strange *noms de plume*';⁴ and we may infer that no self-respecting Chinese litteratus would have dreamt of asking for trouble by putting his name to a work on the lines of Dante's *De Vulgari Eloquentiâ*, in which this sublime Western vulgarian indited, in the sacrosanct classical language, an appreciation of contemporary Western poetry in the living Provençal and Tuscan vernaculars, and garnished his shocking dissertation with quotations *verbatim* from this unmentionable literary garbage, to illustrate points of vulgar style that ought to have been beneath the notice of a properly instructed clerk. All the same, the breach of literary etiquette which a Dante dared to commit openly was perpetrated by Dante's Chinese counterparts in secret; for 'all those great novels have been most widely read by almost everybody who can read at all', and 'even the litterati who pretended to condemn them as vulgar and cheap know them well through reading them stealthily in their boyhood days'.⁵

'Why did it take so long for this living language of such wide currency and with such a rich output in literature to receive due recognition as the most fitting instrumentality for education and for literary composition? . . . The explanation is simple. The authority of the language of the Classics was truly too great to be easily overcome in the days of the [resuscitated Sinic oecumenical] empire. This authority became almost invincible when it was enforced by the power of a long united empire and reinforced by the universal system of state examinations, under which the only channel of civil advancement for any man was through the mastery of the classical language and literature. The rise of the national languages in Modern Europe was greatly facilitated by the absence of a united empire and of a universal system of classical examination. Yet the two great churches in Rome and in East Europe—the shadowy counterparts of the Roman Empire⁶—with their rigid requirements for advancement in clerical life,

⁵ *Ibid.*, p. 60.

⁶ See Hobbes' description of the Papacy, quoted in VII. vii. 696.—A.J.T.

have been able to maintain the use of two dead classical languages throughout these many centuries. It is therefore no mere accident that the revolution in Chinese Literature came ten years after the abolition of the literary examinations in A.D. 1905, and several years after the political revolution of A.D. 1911-1912.¹

It is likewise no accident that the impact of an alien Western culture, which was the *primum mobile* at work in the overthrow of a resuscitated Sinic imperial régime in China, should also have given the initial impulse to the literary revolution which here followed so close upon the political revolution's heels.

'Contact with strange civilisations brings new standards of value with which the native culture is re-examined and re-evaluated, and conscious reformation and regeneration are the natural outcome of such transvaluation of values. . . . The novels which were read by the millions of Chinese, but which were always despised by the Chinese litterati, have in recent decades been elevated to the position of respectable literature, chiefly through the influence of the European literature.'²

This tardy cultural enfranchisement of a notable living genre of literary composition was an incident in the revolutionary exaltation³ of the whole of this formerly humiliated body of living literature, together with the living 'mandarin' *lingua franca* that was its linguistic vehicle, into the seat of the once mighty mummy of a dead Sinic language in which the Confucian Classics were embalmed. In a feat of cultural iconoclasm which was as salutary as it was sacrilegious, the bull who led the way into the china shop was the eminent scholar, man of letters, and philosopher who has been so largely quoted in the last few pages of the present chapter; and anyone who is curious to know the details of this fascinating episode of cultural history⁴ should read Hu Shih's own authoritative account⁵ of the events of which he himself was *magna pars*.⁶ To what the curiosity of readers of this Study, it will suffice to quote the opening sentence of Hu Shih's personal narrative, in which he records that 'the solution of this problem came from the dormitories in the American universities'.⁷

The Entente between the Vernacular Languages of the Hindu World and a Perennial Sanskrit

The severity of this *Kulturkampf* that had to be fought out in China in order to liberate a popular literature in the living 'mandarin' language from the incubus of the Sinic classics presents a piquant contrast to the auspiciously fruitful relations in the history of a contemporary Hindu World between a classical Sanskrit language and literature and a pleiad of popular literatures in living vernacular languages.

¹ Hu Shih, op. cit., pp. 60-61.

² Ibid., p. 47.

³ Luke i. 52.

⁴ This latter-day Chinese revolt against the incubus of a classical Sinic language and literature is itself 'the Chinese Renaissance' according to Hu Shih's terminology, whereas, according to the usage followed in this Study, it would figure as 'the Chinese Anti-Renaissance' in reaction against a previous resuscitation of the language and literature of an antecedent civilization which would rank as 'the Chinese Renaissance' according to our usage of the term.

⁶ Virgil: *Aeneid*, Book II, l. 6.

⁷ Hu Shih, op. cit., p. 50.

This happier Hindu experience is the more remarkable, considering that, *a priori*, the Sanskrit language and literature might have been expected to weigh even more heavily than the Sinic upon the neck of an affiliated society. The Sanskrit's Cronos-like feat of devouring its own children, the *prākṛits*, in a post-Açokan Age of Indic history¹ had endowed the cannibal tongue with such an irrepressible vitality that in the history of a Hindu Civilization, affiliated to the Indic, there was never any question of a renaissance of Sanskrit, because the successfully re-instated archaic Indic language and literature had never tasted death² during an intervening social interregnum which had seen the end of so many other elements of a dissolving Indic Civilization's cultural heritage. In a subsequently born Hindu World this ever-green Sanskrit language and literature enjoyed two signal advantages, neither of which was possessed by the Sinic classics in the Far Eastern World in which these had been resuscitated.

In the first place, Sanskrit was a sacred language, and the literature enshrined in it therefore holy writ, in the eyes of all pious Hindus, whereas in China the classics conveyed in the Sinic characters were merely the canonical expositions of the philosophy of an esoterically cultivated corporation of civil servants. This Confucian guild's influence on the masses was not comparable, either in range of diffusion or in degree of intensity, with the influence of the Brahman caste that was the custodian of a Hindu Society's Sanskrit heritage from an Indic past; and the Brahmans had turned their social prestige to account by achieving two feats which, if they had not been achieved both at once, might have been imagined to be incompatible. On the one hand the Brahmans had incorporated into their canon of holy scripture the profane works of Sanskrit literature, including the epics, by dint of copiously interpolating incongruous theological matter;³ and on the other hand they had managed to save a drastically 'doctored' heroic poetry from losing its popular appeal. An interpolated *Mahābhārata* and *Rāmāyana* were never relegated to the shelves of Brahmanic theological libraries; throughout the course of Hindu history they never ceased to 'flit alive from mouth to mouth'.⁴

An early twentieth-century Confucian litteratus would have been dumbfounded if on an oecumenical grand tour he had found, at the annual *paniyiris* on the Aegean island of Tinos, crowds of Modern Greek Orthodox Christian pilgrims listening spellbound to a recital of the *Odyssey* interpolated with passages of Neoplatonic theology in a passable imitation of the Homeric diction, or if, at some gathering of a similar kind in Algarve or in Hainault, he had come across Portuguese or Walloon peasants drinking in, with equal eagerness, a recital of the *Aeneid* interpolated with an exposition of Saint Augustine's arguments against Pelagianism in Latin verse which Augustine, if not Virgil himself, might have allowed to pass muster. Even in a latter-day Chinese setting, not to speak of a latter-day Greek Orthodox Christian or

³ See V. v. 597 and 605-6.

⁴ 'Volito vivo' per ora virum'.—Quintus Ennius's anticipatory epitaph for himself.

Romance Western secular setting, such imaginary scenes are, of course, wildly fantastic. The epic stories of the street reciter and the drama of the village theatre (with its auditorium open, *more Hellenico*, to the sky), with which our cultivated Chinese scholar-traveller would have been contemptuously familiar at home, would have been products, not of the pre-Confucian Age of an antecedent Sinic Civilization, but of the Confucian licentiate's own living Far Eastern Society's still recent Time of Troubles. The oldest of them would not yet have been seven hundred years old by the year A.D. 1900.¹ If, however, our traveller from Tientsin had visited, *en route* for the West, the festival annually celebrated in Rāma's honour at Benares, he would have had to confess that his own Sinic classics had been put out of countenance by Indic classics that had never ceased to be cherished by the people as well as by the pandits; for at Benares at this season of the year he would have witnessed² in the every-day life of a living Hindu Society an exact counterpart of those imaginary scenes that look so fantastic when set against even a Far Eastern, not to speak of a Near Eastern or a Western, back-cloth.

Where the classical language and literature of a dead antecedent civilization had thus managed to retain their hold on the imagination and affection of an affiliated society as living treasure-houses of both theological authority and popular entertainment, what chance might the living vernacular languages of the Hindu World be expected to find of securing employment for themselves as alternative vehicles for literature? When Sanskrit was so securely and completely in possession of this field, could any living language aspire to play even a modest and subordinate literary role? Had not Sanskrit already driven its own children, the *prākṛits*, out of the literary field before the close of the history of an antecedent Indic Civilization? And, if this world-conquering classical language's diadochi had suffered this fate at Sanskrit's hands, did not this precedent spell in advance the doom of the *epigoni*?

Any alien observer who had ventured to make such prognostications on the basis of Indic experience would, however, have found them falsified by the event; for the effect of the vitality of Sanskrit on the fortunes of the Hindu World's vernaculars was not a withering blight but was, on the contrary, a potent stimulus.³ In the Archaic Age of Hindu history,

¹ See Hu Shih: *The Chinese Renaissance* (Chicago 1934, University Press), pp. 53 and 61, cited on pp. 77 and 78, above.

² See MacDonell, A. A.: *A History of Sanskrit Literature* (London 1900, Heinemann), p. 317.

³ In seeking to account for the difference in the respective literary fortunes of the *prākṛits*—which, save for the survival of Pāli as the medium of the Hinayanian Buddhist scriptures, were driven off the field of literary usage by their Sanskrit parent's counter-offensive—and of the latter-day parochial vernacular languages of a Hindu World which were fertilized by their encounter with the Sanskrit language and literature, instead of being blighted by it, we have to allow for one pertinent consideration of a linguistic, not a literary, order. The *prākṛits*' chances of victory in their competition with their Sanskrit parent were no doubt compromised by the linguistic fact that the degree of their differentiation from a common Sanskrit stock was slight enough to allow anyone who was literate in any *prākṛit* to take to reading and writing Sanskrit, instead, with little difficulty. In departing from the pattern of Sanskrit, the *prākṛits* had not gone so far as to break with the habit of expressing relations by the inflexion of the verbs and nouns that were the vehicles of meaning, instead of hitting upon the use of separate auxiliary words. The *prākṛits*, like their Sanskrit parent, were inflective languages of the primitive Indo-European type. On the other hand the vernaculars of the next generation, derived

between the first emergence of a Hindu Civilization out of a post-Indic interregnum towards the end of the eighth century of the Christian Era and the Muslim conquest of the Ganges-Jumna Basin towards the end of the twelfth century,¹ we find the heroic poetry at the courts of parochial Rājput princes, descended from Hun and Gurjara Eurasian Nomad barbarian invaders, being composed, not in the classical Sanskrit of the *Mahābhārata*, but in a vernacular Hindī which was the living language caught by the interloping alien conquerors from their Hindu subjects.² If now—racing the drum round which our film of Hindu history unwinds—we pass on, in a flash, to the first phase of a universal state in which the Hindu Society temporarily arrested its disintegration after having gone through the experiences of a breakdown and a Time of Troubles, we shall find the Hindu genius embodied, in this generation, not in the alien Timurid Turkish Muslim empire-builder Akbar (*vivebat* A.D. 1542-1605), but in his contemporary and subject—probably unknown to Akbar himself—the Hindī poet Tulsī Dās (*vivebat circa* A.D. 1530-1623).³

A priori an alien observer might have expected that a Hindu man of genius, whose mission in life was to do in the Hindī language what was done in Latin by an Augustan Hellenic Virgil and in Tuscan by an Early Modern Western Ariosto, would have chosen for his own literary epic in Hindī any subject rather than the theme of a *Rāmāyana* whose Sanskrit *ślokas* were still 'fitting alive from mouth to mouth' in the latter-day poet's own time. Tulsī Dās, however, had a truer intuition of both the inclinations and the capacities of a catholic-hearted Hindu soul. He correctly divined that his people's devotion to a Sanskrit *Rāmāyana* would open, and not close, their hearts to the appeal of a Hindī *Rām-charit Mānas*; and a Late Modern Western student of the Sanskrit literature has seen the culminating triumph of the *Rāmāyana* in this Sanskrit epic's ability, more than a thousand years after it had set hard in its own definitive form, to inspire the composition of a Hindī epic 'which, with its ideal standard of virtue and purity, is a kind of bible to a hundred millions of the people of Northern India'.⁴

from the prākritis, did sharply differentiate themselves from their parents by taking the revolutionary step that was taken by the Romance languages when they broke out of Latin, and by English when it broke out of Anglian (see III. iii. 176-9). In crossing this great linguistic 'divide', these Indo-Aryan languages of the third generation had cut themselves off from their prākrit parents and their Sanskrit grandparent alike, and had thereby ensured their hold, more effectively than the prākritis had ever ensured theirs, against the risk of an attempt on the part of Sanskrit to capture for itself exclusively the entire literary allegiance of the peoples speaking these derivative languages as their mother tongue. *Admittedly* it was difficult for Sanskrit to deprive of their literary birth-right the *prākrita* languages of Southern India which, like the Ugro-Finnish languages in Hungary, Finland, and the domain of the Soviet Union, were non-Indo-European. The Hindu devotional poetry in the Dravidian languages was even less in danger than a Hindī *Rāmcharit Mānas* was of ever being supplanted by a classical Sanskrit equivalent.

² See Rawlinson, H. G.: *India, A Short Cultural History* (London 1948, Cresset Press), pp. 214-15.

³ See Rawlinson, op. cit., pp. 373-5, and the present Study, V. v. 518, with n. 3.

⁴ Macdonell, op. cit., p. 317. Compare the appreciation in Sir Charles Eliot: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, pp. 245-7. His *Rāmāyana* [i.e. the *Rāmcharit Mānas*], which is an original composition and not a translation of Vālmīki's work, is one of the great religious poems of the World and not unworthy to be set beside *Paradise Lost* (p. 246).

Tulsī Dās' happy experience of an immortal Sanskrit epic's genially fructifying effect on the literary use of a living vernacular language would assuredly have given him no inkling of the hardness of the battle that a Hu Shih would have to fight in order to liberate a living 'mandarin' *lingua franca* from the tyranny of the Sinic classics.

(e) RENAISSANCES OF VISUAL ARTS

The renaissance of one or other of the visual arts of a dead civilization in the history of an affiliated civilization of the next generation is a not uncommon phenomenon. Among the more familiar instances of it we may mention the renaissance of 'the Old Kingdom's' style of sculpture and painting, after a two-thousand-years-long lapse, in a latter-day Egyptiac World of the Saïte Age in the seventh and sixth centuries B.C.;¹ the renaissance of a Sumeric style of carving in bas-relief—of which the finest specimen retrieved by Modern Western archaeologists was the stele of the Akkadian war-lord Naramsin (*dominabatur circa 2422–2367 or 2358–2303 B.C.*)—in a Babylonian World of the ninth, eighth, and seventh centuries B.C. in which this resuscitated Sumeric art was practised with the greatest virtuosity in Assyria; and the renaissance, in miniature, of an Hellenic style of carving in bas-relief, of which the most exquisite exemplars were Attic masterpieces of the fifth and fourth centuries B.C., on Byzantine diptychs—carved, not in stone but in ivory, in the tenth, eleventh, and twelfth centuries of the Christian Era²—in which the folds of the drapery of the Theotókos are nostalgically Hellenic in the beautiful severity of their lines. These three visual renaissances, however, were all left far behind, both in the range of the ground covered and in the ruthlessness of the eviction of the previous occupants, by a renaissance of Hellenic visual arts in Western Christendom which made its first epiphany in a Late Medieval Italy and spread thence to the rest of the Western World during a Modern Age of Western history. This evocation of ghosts of Hellenic visual arts was practised in the three fields of Architecture, Sculpture, and Painting; and, in every one of these three fields, the *revenant* style of art made so clean a sweep of the style that it found in possession of the corresponding sector of a Western artistic arena that, by the time when the aggressive ghost had spent his formidable force, Western Man had become so thoroughly used to living his aesthetic life under this alien ascendancy that he did not know what to do with a liberty that was not recovered for him by his own exertions, but was reimposed upon him by the senile decay of a pertinaciously tyrannical intruder. When the evaporation of an Hellenic spectre presented Western souls with an aesthetic vacuum, they found themselves at first unable, for the life of them, to say what was the proper visual expression for the West's long-suppressed native artistic genius.

The same strange tale of a house swept and garnished³ by the drastic hands of ghostly visitants has to be told of each of the three provinces of

¹ See V. vi. 61–62. The peculiar relation of a post-Hyksos epilogue to an Egyptiac history which had reached its natural term after the dissolution of 'the Middle Empire' makes it hard to know whether to label the artistic revival of the Saïte Age a renaissance or a manifestation of Archaism.

² See IX. viii. 103.

³ Matt. xiii. 44; Luke xi. 25.

Western visual art that have been mentioned; but the most extraordinary episode of the three was the triumph of an Hellenic *revenant* over the native genius of the West in the province of Sculpture in the Round; for, in this field of artistic endeavour, the thirteenth-century Northern French exponents of an original Western style had produced masterpieces that could look in the face those of the Hellenic, Egyptian, and Mahayanian Buddhist schools at their zeniths, whereas in the field of Painting, by the time when a *revenant* Hellenic style invaded it, Western artists had not yet shaken off the tutelage of the more precocious art of a sister Orthodox Christian Society, while in the field of Architecture the Romanesque style—which, as its latter-day label indicates, was a nascent Western World's variation on an architectural theme inherited from the latest age of an antecedent Hellenic Civilization—had already been overwhelmed by an intrusive 'Gothic' style which, contrary to the implication of its misnomer, had originated, not among the barbarians in a no-man's-land beyond the European *limes* of the Roman Empire, but in a Syriac World which, *in articulo mortis*, had made a cultural conquest of the savage Western Christian military conquerors who had seized upon fragments of a dissolving 'Abbasid and a dissolving Andalusian Umayyad Caliphate.

For a twentieth-century Londoner's enlightenment the combatants in a mortal struggle between a doubly defeated native Western visual art and its alien Syriac and Hellenic assailants were still standing, turned to stone in the postures of the last act in their encounter, in the architecture and sculpture of the chapel (*aedificatum* A.D. 1503–19) that had been built on to Westminster Abbey under the auspices of King Henry VII of England (*regnabat* A.D. 1485–1509). In the vaulting of the roof the 'Gothic' style had achieved a *tour de force* which, though manifestly its *ne plus ultra*, was a *chef-d'œuvre* capable of still holding at bay the waxing Hellenic invader who was now treading so importunately on a waning Syriac invader's heels. In the host of erect stone figures *in excelsis*, which declared in dumb-show *morituri te salutamus* as they gazed down at an Italian Hellenomime's trinity of recumbent bronze figures on the tombs below,¹ a Transalpine school of native Western Christian sculpture was singing a silent swan-song between frozen lips. The centre of the stage was held by the Hellenizing masterpieces of a Torrigiani (*vivebat* A.D. 1472–1522) who—contemptuously ignoring the uncouth milieu in which he had deigned to execute his own competently polished work for the sake of the lucrative profits to be earned from a royal patron *in partibus Barbarorum*—was looking round him complacently in the confident expectation that, *in saecula saeculorum*, these fruits of a Florentine master's voluntary exile would be the cynosure of every Transalpine sight-seer's eyes.²

¹ The contrast between these respective products of a surviving Transalpine native Western school and a contemporary Hellenizing Italian school of sculpture in Henry VII's Chapel came out dramatically when, after the War of A.D. 1939–45, the pensive English-carved figures usually marooned at Westminster up aloft were placed on exhibition at the Victoria and Albert Museum at South Kensington on a level with the spectator's eye and face to face with Torrigiani's accomplished gilt angels.

² 'This man had a splendid person and a most arrogant spirit, with the air of a great soldier more than of a sculptor, especially in . . . his vehement gestures and his resonant

A 'Gothic' architecture which thus continued to hold its own until the first quarter of the sixteenth century of the Christian Era in London—and the first half of the seventeenth century in Oxford—had by then long since been driven off the field in Northern and Central Italy; for here it had never succeeded, so decisively as in Transalpine Europe, in supplanting a Romanesque style which, in the realm of Architecture, was the native expression of the Western spirit. Italy was the bridgehead in which an alien presence, conjured up from a dead Hellenic World, first entrenched itself on Western soil; and the successive stages in the triumphal progress of a Hellenizing style of architecture, which was eventually to replace the Romanesque and the 'Gothic' alike in all quarters of the Western World, could be followed in the history, running from A.D. 1296 to A.D. 1461, of the building of the Cathedral of Santa Maria del Fiore at Florence. The Florentines' decision, taken in A.D. 1294, to 'scrap' their medieval cathedral dedicated to Saint Reparata in order to erect a modern building on the site may be taken as a symbolic act signifying a resuscitated Hellenism's declaration of aggressive war upon a Medieval Western *status quo ante*. The climax of an architectural drama which did not become tedious through being spun out over a span of 167 years was the victory of Filippo Brunelleschi (*vivebat* A.D. 1377–1446) in a public competition, opened in A.D. 1418, for designs for the construction of a cupola to crown the fane of a goddess who, to tell the truth, was not Mary the mother of Christ but was Venus the mother of Cupid.¹

Brunelleschi's cupola made so deep an impression on the imagination of a duly astonished Western World that the homely Italian word *duomo*, signifying 'the house [of God]', thereafter acquired, in Western parlance, the secondary meaning of an architectural structure which Western builders had lacked the skill to execute before Brunelleschi elicited the secret from the testament of a dead Hellenic Society that had mastered this difficult art in its own extreme old age.² Yet Brunelleschi's cautiously high-pitched 'dome', which created this sensation in the West after it had been translated from an idea into a reality by the labours of fourteen years (A.D. 1420–34), would have looked clumsy to the eye of the contemporary Ottoman architect of a Green Mosque at Brusa³ which was built for Sultan Mehmed I (*imperabat* A.D. 1413–21);⁴ and, four hun-

voice—together, with a habit he had of knitting his brows, enough to frighten any man of courage. He kept talking every day about his gallant feats among those beasts of Englishmen' (Benvenuto Cellini: *Autobiography*, English translation by J. A. Symonds (London 1949, Phaidon Press), Book I, chap xii, p. 18).

¹ The prominence of the role which the Florentines assigned to their own city in the 'reception' of a *renewed* Hellenism in Italy and in the Western World at large was symbolized in the picture, painted by Sandro Botticelli (*vivebat* A.D. 1444–1510), of Florence hospitably running forward to cast a magnificent cloak over the shoulders of a naked Venus, newly risen from the foam and serenely riding on a fabulously gigantic sea-shell, who was being blown inshore by obstreperous puffs from the Winds.

² See IV. iv. 21 and 54–55.

³ If the Ottoman architect Hajji Ayvas, son of Ahî Bâyezîd, whose name appears in the inscription in the porch above the main entrance to the Green Mosque, had been given an opportunity of inspecting Brunelleschi's work, his verdict would probably have been that this was not even a genuine cupola.

⁴ The inscription in the porch of the Green Mosque bears a date A.H. corresponding approximately to A.D. 1419 (see *Bursa*, published by la Direction Générale de la Presse, Ankara, 1949). The inscription over the Sultan's upper chamber, within, records that

dred years after the Feringi Brunelleschi's day, when his successors had run through all the resources of a resuscitated Hellenic technique, and had gone on to apply them to the revolutionizing of domestic as well as public architecture, the ultimate effect of their technical ingenuity was to make an aesthetic desert, since they had quenched both a native Romanesque and an exotic 'Gothic' vein long before they had emptied an Hellenic Amalthea's imported cornucopia.

The sterility with which the Western genius had been afflicted by a renaissance of Hellenism in the domain of Architecture was proclaimed in the West's surprising failure to reap any architectural harvest from the birth-pangs of the Industrial Revolution. In Great Britain at the turn of the eighteenth and nineteenth centuries, and in the Western World as a whole before the nineteenth century reached its close, a mutation in industrial technique that had begotten the iron girder had suddenly thrust into the Western architect's hands an incomparably versatile new building-material; and this gift of the grimy gods might have been expected to inspire the favoured Western human recipient to break even the toughest cake of inherited architectural custom in an eager exploration of the potentialities of a hitherto untried instrument. As it happened, no great effort was required of a Western architect of that generation to break a Hellenizing architectural tradition that was then already crumbling between his fingers; yet the architect who had been presented by a blacksmith with the iron girder, and by Providence with a clean slate, could think of no better ways of filling an opportune vacuum than to cap an Hellenic Renaissance with 'a Gothic Revival' and to recoil from the 'Gothic' ironmongery of Ruskin's Science Museum at Oxford and the Woolworth Building in New York into a 'Colonial' brickwork¹ reproducing the Hellenizing Western style of architecture as this had been practised during an eighteenth-century North American 'Indian Summer'.

The first Westerner to think of frankly turning the iron girder to account as a building material without bashfully drawing a 'Gothic' veil over his Volcanic vulgarity was not a professional architect but an imaginative amateur; and, though he was a citizen of the United States, the site on which he erected his historic structure overlooked the shores of the Bosphorus, not the banks of the Hudson. The nucleus of Robert College—Hamlin Hall, dominating Mehmed the Conqueror's Castle of Europe—was built by Cyrus Hamlin in A.D. 1869-71;² yet it was only within the life-time of the writer of this Study, who was born in A.D. 1889 and was writing these lines in A.D. 1950, that the seed sown by

the work was completed in A.D. 1423 (see *Konstantinopel und das Westliche Kleinasien* (Leipzig 1905, Baedeker), p. 144).

¹ See V. vi. 60.
² 'The building is 113 feet by 103. . . . The stone is the same as that of the fortress built in A.D. 1452-3. . . . It is fire-proof, the floors being of iron beams with brick arches' (Hamlin, Cyrus: *Among the Turks* (London 1878, Sampson Low), p. 297).

'While the work of construction was going on, Dr. Hamlin . . . might be in the water at the bottom of the well mending the force pump, or at the top of the building standing on an iron girder with forty feet of empty space below him. . . . He . . . was never daunted by any new and unthought-of problem which presented itself in the building. . . . The public opening was postponed to the 4th July [1871], just two years from the laying of the corner stone' (Washburn, D.: *Fifty Years in Constantinople* (Boston and New York 1909, Houghton Mifflin), pp. 28-29 and 47).

Hamlin in Constantinople bore fruit in a Western World that was Brunel's as well as Hamlin's homeland.

This sterilization of the West's artistic genius, which was the nemesis of a Hellenizing renaissance in the realm of Architecture, was no less conspicuous in the realms of Painting and Sculpture. Over a span of more than half a millennium running from the generation of Dante's contemporary Giotto (*decessit* A.D. 1337), a Modern Western school of Painting, which had unquestioningly accepted the naturalistic ideals of an Hellenic visual art in its post-archaic phase, had worked out, one after another, divers methods of conveying the visual impressions made by light and shade until this long-sustained effort to produce the effects of photography through prodigies of artistic technique had been stultified, on the eve of its consummation, by the invention of photography itself. After the ground had thus inconsiderately been cut away from under their feet by the shears of Modern Western Science, Modern Western painters made a 'Pre-Raphaelite' Movement,¹ in the direction of their long since repudiated Byzantine provenance, before they thought of exploring a new world of Psychology which Science had given them to conquer in compensation for the old world of Physical Nature which she had stolen from the painter in order to hand it over to the photographer. After the invention of photography the best part of a century had to pass before the rise of an apocalyptic school of Western painters who made a genuinely new departure by frankly using paint—veritably *more Byzantino*—to convey the spiritual experiences of Psyche instead of the visual impressions of Argus;² but the increasing sureness of foot with which the Western painters were advancing along this new road by the close of the first half of the twentieth century seemed to augur that the Western sculptors, in their turn, would eventually set their faces in the same direction after discovering, by trial and error, that the broken road to Athens, which they had been following ever since a Niccolò Pisano had swerved into it in the thirteenth century, could not, after all, be regained by a detour through either Byzantium or Benin.

Thus, at the time of writing, it looked as if, in all three visual arts, the sterilization of a native Western genius by an exotic Hellenizing renaissance might eventually be overcome; but the slowness and the difficulty of the cure showed how serious the damage had been.

(f) RENAISSANCES OF RELIGIOUS IDEALS AND INSTITUTIONS

In the Realm of Religion the classical example of a renaissance was Judaism's perennial trick of springing up, like an accusatory jack-in-the-box, out of Christianity's Ark of a New Covenant.

The relation of Christianity to Judaism was as damningly clear to Jewish eyes as it was embarrassingly ambiguous for Christian consciences. In Jewish eyes the Christian Church was a renegade Jewish sect which, on the evidence of its own unauthorized appendix to the

¹ See V. vi. 60.

² In IV. iv. 52, this positive aim of a revolutionary twentieth-century school of Western painting has not been given due recognition.

Canon of Scripture, had sinned against the teaching of the obscure, misguided, and unfortunate, but undeniably idealistic, Galilean Pharisee whose name these traitors to Pharisaism had impudently taken in vain. As Jewish witnesses saw it, Christianity's allegedly miraculous captivity of an Hellenic *oikoumenê* was not the Lord's doing and was not marvellous;¹ for this was assuredly no repetition of what Yahweh had done for Israel in the days of Moses and Joshua, when He had led His Chosen People through the Wilderness and given them the Promised Land. The posthumous triumph of a Jewish rabbi who had been saluted by his followers, *more Hellenico*, as the son of a god by a human mother, was a pagan exploit of the same order as the historic conquests of an Alexander and a Caesar or the legendary conquests of a Bacchus and a Héraklès. Judaism herself could have anticipated Christianity's conquest of the Hellenic World before Christianity had ever been heard of, if Judaism had stooped to conquer by descending to Christianity's level; but 'what shall it profit a man if he shall gain the whole World and lose his own soul?'² A Christianity which had never repudiated the authority of the Jewish Scriptures, and which had the audacity to declare itself to be the fulfilment of the Law, had made a facile conquest of a whole Hellenizing World—with the outstanding exception of a faithful remnant of Jewry—by betraying Judaism's two cardinal principles, Monotheism and Aniconism, which were Yahweh's supreme revelations. If Jewry had been willing thus to betray the Lord's trust by compromising with an Hellenic Polytheism and an Hellenic Idolatry, Jewry, too, could have cajoled the Hellenes into a nominal acceptance of Judaism at the price of Judaism's capitulating to Hellenism on the two crucial points of substance. And now, in face of a still impenitent Hellenic paganism, whose unchanged Ethiop skin³ remained indecently visible through a transparent Christian dress, the watchword for Jewry was to persevere in bearing her witness to the Lord's everlasting revelations and commandments. In the words of a renegade disciple of Gamaliel's:

'Take unto you the whole armour of God, that ye may be able to withstand in the evil day, and, having done all, to stand. Stand therefore, having your loins girt about with truth.'⁴

This 'patient deep disdain'⁵ with which a sensationally triumphant Christianity continued to be regarded by an unimpressed and unshaken Jewry was an annoyance which a victorious Church could perhaps have afforded to discount as the expression of a discomfited competitor's inevitable pique, if Christianity herself had not combined a sincere theoretical loyalty to a Jewish legacy of Monotheism and Aniconism with those politic practical concessions to an Hellenic Polytheism and Idolatry for which she was being arraigned by her Jewish critics. A Christian Church's reconsecration of the Jewish Scriptures as the Old Testament of a Christian Faith was the weak spot in Christianity's armour through which the shafts of Jewish criticism went home to Christianity's heart. 'Thou shalt have no other gods before Me' and 'Thou shalt not make

⁴ Eph. vi. 13-14.

unto thee any graven image, or any likeness of anything that is in Heaven above or that is in the Earth beneath or that is in the water under the Earth, thou shalt not bow down thyself to them nor serve them',¹ were commandments which the Christian believed, just as unquestioningly as the Jew, to be words of God which Man was required to obey without any reservations.

The Ten Commandments were of the essence of an Old Testament which the New Testament was perpetually invoking as its authority and hallowing as the Scripture that Christ had come to fulfil. The Old Testament was consequently one of the foundation stones on which the edifice of Christianity rested; but so, too, was the doctrine of the Trinity, so again was the cult of the Saints, and so likewise was the visual representation of the Saints and of all three Persons of the Trinity in three-dimensional as well as two-dimensional works of visual art. None of these foundation stones could be pulled out from under the building without danger of bringing it down. Yet how could Christian apologists answer the Jewish taunt that the Church's Hellenic practice was irreconcilable with her Judaic theory? Some reply was required that would convince Christian minds that there was no substance in Jewish arguments; for the tellingness of the Jewish exposure of the hypocrisy of the Christian Church lay in the responsive conviction of sin which this Jewish indictment evoked in Christian souls. Judaism was thus able to take its revenge on Christianity by forcing the Church to fight on two fronts simultaneously; and the foreign war against an obstinately unconverted Jewry was less formidable for the Christian ecclesiastical authorities than the domestic struggle, waged within the *penetralia* of each individual Christian soul, between an Hellenically easy-going Christian paganism and a Judaically tender Christian conscience.

The duality of the conflict is reflected in Christian polemical literature in the distinction between the genre of apologias for Christianity against Jewish attacks upon it and the genre of controversies within the bosom of the Church between Christian iconodules and Christian iconoclasts, though the arguments bandied about in both genres, and taken over, on either side, by successive generations of controversial writers from the works of their predecessors, are, of course, identical to a large extent.²

¹ Exod. xx. 3-5. Cp. Lev. xxvi. 1; Deut. v. 7-9 and vi. 14.

² Stock arguments in the armoury of Christian iconodule apologetics were: (i) that God's veto, communicated to Moses on the Tables of the Law, forbidding the visual representation of human beings and animals, must have been at least tacitly rescinded by Solomon's time, since Solomon is recorded in the Bible (see 1 Kings vi. 23-29, 32, 35, and vii. 25, 29, 36, 44) to have included graven images among the paraphernalia that he introduced into his temple, but is not recorded to have got into trouble with the Lord for having done this, though he is frankly recorded to have got into trouble in the same quarter for other doings of his (see 1 Kings xi. 9-40); (ii) that Christian iconodules differed decisively from the pagan idolators in the capital point that, unlike them, they did not make the images into objects of worship in themselves, but merely paid them reverence out of regard for the living beings of which they were lifeless representations, and reserved their worship for God alone in His invisible spiritual essence.

Iconodule arguments used at the turn of the sixth and seventh centuries in a tract against the Jews published by the Cypriot Archbishop Leontius of Neapolis in Greek also appear in the Armenian text of a tract against Christian iconoclasts that is attributed to Leontius's contemporary Vrt'anes K'ert'ogh (*florebat circa* A.D. 600). A French translation of Vrt'anes' tract is given by S. Der Nersessian, in 'Une Apologie des Images du viii^e Siècle', in *Byzantion*, vol. xvii, 1944-5 (Baltimore, Md. 1945, Byzantine Institute and

After the nominal conversion, *en masse*, of an Hellenic Gentile World in the course of the fourth century of the Christian Era, the domestic controversy within the bosom of a now Pan-Hellenic Church tended to overshadow the polemics between Christians and Jews; but the theological warfare on this older front seems to have flared up again in the sixth and seventh centuries in consequence of a puritanical house-cleaning in Jewry which, in the Palestinian Jewish community, had been taken in hand towards the close of the fifth century. This domestic campaign, within Jewry's bosom, against a Christian-like laxity that had latterly been tolerating the visual representation of animals, and even of human beings, in the mural decorations of synagogues,¹ had its repercussions on a Jewish-Christian battle-front in a resumption of offensive-defensive Christian polemical operations against the Jewish denunciation of Christian idolatry. When we turn to the parallel controversy between Christian iconophiles and Christian iconophobes, we shall be struck by its persistence and its ubiquity. From the morrow, and indeed from the eve, of the Christian Church's victory over a pagan Diocletianic imperial régime, we find this 'irrepressible conflict between opposing and enduring forces'² bursting out in almost every province of Christendom in almost every succeeding century of the Christian Era.

In a still unfissured Catholic Church a ferment of Iconophobia can be seen spreading in and after the fourth century. The exhibition of pictures in churches was forbidden by the thirty-sixth canon³ of the Council of Elvira (*sedebat circa* A.D. 300/11).⁴ Eusebius of Caesarea (*vivebat circa* A.D. 264-340) refused to oblige Constantine the Great's sister, Constantia, by granting a request of hers to him to send her a holy image. Epiphanius, Bishop of Constantia (alias Salamis) and Metropolitan of Cyprus (*vivebat circa* A.D. 315-402; *thronum conscendit* A.D. 367), tore up a curtain with a picture embroidered on it which he found hanging in a church.⁵ In a Syriac Orient an attack against image-worship

Mediaeval Academy of America), pp. 58-69. A confrontation of parallel passages in Vrt'anes' and Leontius's tracts will be found *ibid.*, p. 76. See also N. H. Baynes: 'The Icons before Iconoclasm', in *The Harvard Theological Review*, vol. xlv, No. 2 (Cambridge, Mass. 1951, Harvard University Press), pp. 93-106. It was Professor Baynes who first called the present writer's attention to Miss Der Nersessian's paper. See now also Alexander, P. J.: 'Hypatius of Ephesus, A Note on Image Worship in the Sixth Century', in *H.T.R.*, vol. xlv, No. 3 (1952), pp. 177-84.

¹ See Der Nersessian, S.: 'Une Apologie des Images du viii^e Siècle' in *Byzantion*, vol. xvii, 1944-5 (Baltimore, Md. 1945, Byzantine Institute and Mediaeval Academy of America), p. 79, citing, in n. 92, Frey, J. B., 'La Question des Images chez les Juifs', in *Biblia*, vol. xv, 1934, p. 298. The date of this domestic campaign in Jewry against intrusive idolatrous practices is historically significant. Coming, as it did, in the fifth century of the Christian Era, on the heels of the successive Nestorian and Monophysite reactions, inside the Christian Church, against the Hellenic element in Christianity, this puritanical Jewish drive against an infection of Hellenism in Jewry's bosom can be seen to have had its origin in the wave of Hellenophobia that began, in that century, to rise from the depths of a submerged Syriac Society, and that continued thereafter to swell up until it eventually broke upon the Hellenic World in an Islamic cataclysm.

³ 'Placuit picturas in ecclesiâ esse non debere, ne quod colitur et adoratur in parietibus depingatur.'

⁴ *Circa* A.D. 300 according to Zeiller, J., in Lebreton, J., and Zeiller, J.: *Histoire de l'Église*, vol. ii (Paris 1938, Bloud et Gay), p. 399; *circa* A.D. 311 according to Vogt, J.: *Constantin der Grosse und sein Jahrhundert* (Munich 1949, Münchner Verlag), p. 169.

⁵ In this connexion it is perhaps significant that Epiphanius was a Palestinian of Jewish origin.

was launched, *circa* A.D. 488, by Xenaïas the Monophysite bishop of Mabbūg (*Graecè* Bambycê-Hierapolis); and in the sixth century there were iconoclast riots at Edessa and at Antioch. In the same century in the Greek heart of a Christian *oikoumenê* the strength of iconoclastic feeling is indicated by the recorded fact that Julian, bishop of Adramyttium, prohibited the exhibition, in churches of his diocese, of any [visual] representations in the round and of any two-dimensional representations in the media of stone and wood, and permitted sculpture-work on the doors only.¹ In the same century in the Latin West the strength of iconoclastic feeling is indicated by the recorded facts that a sixth-century bishop of Narbonne found it politic to drape a picture of Christ on the Cross, and that Pope Gregory the Great's contemporary, Bishop Serenus of Marseilles, broke or removed all images found by him in churches in his diocese.² *Circa* A.D. 670, in the citadel of Melchite orthodoxy at Constantinople, the Western Christian pilgrim Arculf was told a story of a man (vilified by him, or by his recorder Adamnan, as *ille Iudeus incredulus*) tearing down an image of the Theotókos from the wall of a house on which it was hanging, when he had learnt who it was that the image represented, and carrying it—apparently without making any concealment of what he was doing and also without exciting any protest—to a neighbouring public latrine, where,

'ob Christi ex Mariâ nati dehonorationem, imaginem matris eius per foramen super humanum stercus inferius iacens proiecit et ipse super-sedens, per idem foramen alvum purgans, proprii stercus ventris super thoracidem beate Marie paulo ante ibi depositam dimittens, stolidissime agens profudit.'³

In Cyprus, where the iconophobe persuasion in the Christian Church's controversy found a champion in the fourth century in an Epiphanius of Constantia, and where the iconodule cause was championed at the turn of the sixth and seventh centuries by a Leontius of Neapolis in a polemical tract addressed to the Jews,⁴ the question seems to have been a burning one; and we may hazard the guess that the perennial interest in it, and sharp division of opinion over it, in Cypriot Christian circles may have been a legacy from the former presence of an influential Jewish community on an island which the Roman imperial authorities had subsequently placed out of bounds for Jews, in retaliation for the Jewish insurrection there in A.D. 115-17.⁵ There was not, however, any com-

¹ See Alexander, *op. cit.*, p. 179. A tract addressed to Bishop Julian by his ecclesiastical superior Hypatius, Metropolitan of Ephesus, putting the case for visual representations in churches, will be found in *Orientalia Christiana Analecta*, vol. cxvii (Rome 1938, Pontificale Institutum Orientalium Studiorum), pp. 127-9. A translation, with notes and commentary, is given by Alexander, in *loc. cit.*

² Gregory's correspondence with Serenus about these proceedings is printed by J. P. Migne in his *Patrologia Latina*, vol. lxxvii, cols. 1027-8 and 1128-30.

³ *Arculfi Relatio de Locis Sanctis ab Adamnano Scripta*, Book III, chap. 5 (in Tobler, T., and Molinier, A.: *Itinera Hierosolymitana et Damascena Terrae Sanctae Bellis Sacris Anteriora et Latina Lingua Exarata* (Geneva 1893, 2 vols.), vol. i, pp. 199-201). All the cases of Iconophobia, except for Julian's case, that have been cited in this paragraph have been collected by S. Der Nersessian in *op. cit.*, pp. 69-70, and the references to the original sources will be found there.

⁴ See p. 88, n. 2, above. The surviving fragments of this tract are printed by J. P. Migne in his *Patrologia Graeca*, vol. xciii, cols. 1597-1609. Extracts—apparently from a different version—are quoted by Saint John of Damascus (see Baynes, *op. cit.*, p. 97, n. 10). A résumé of Leontius's arguments is given by Baynes, *ibid.*, pp. 97-103.

⁵ See V. v. 68.

parably potent local Jewish stimulus, either present or past, to account for the sixth-century and seventh-century skirmishes between Christian iconophiles and Christian iconophobes in Armenia and Transcaucasia which have left their mark on the surviving local historical records; and these traces of the controversy in this outlying province of a Christian *oikoumenê* at this date suggest that an iconophobe reaction against a prevailing Iconophilia must by then have become endemic throughout an oecumenical Christian body ecclesiastic.

In the days of the Catholicos Nerses II of Albania¹ (*fungebatur* A.D. 548–57), local iconoclasts, whom this pontiff had expelled from his patriarchate, sought an asylum, beyond the limits of their persecutor's ecclesiastical jurisdiction, in Armenia.² Their advent presumably accounts for the anti-iconoclast measures that were taken at an Armenian church council held at Dvin, the capital of Persarmenia,³ in A.D. 554.⁴ These measures, however, proved ineffective; for, after the cession of Persarmenia to the Roman Empire in A.D. 591 and the election, in the same year, of a pro-Calchedonian Melchite Catholicos of Armenia, John, at Karin (alias Theodosiopolis, alias Erzerum), the capital of the section of Armenia that had always been in Roman hands since the partition in the reign of the Emperor Theodosius I, three iconoclast monks fled eastwards from Dvin, where they had hitherto been taking their stand under the nose of the anti-Calchedonian Monophysite Catholicos of Armenia, Moses. After seeking asylum first at Sot'k' in Siunik, and then at Artsakh, just on the Armenian side of the Armenian-Albanian frontier, the fugitives were eventually arrested in Ut'i by the Baron of Gardman and were sent back by him in chains to the Armenian ecclesiastical authorities.⁵

Nevertheless, Iconophobia was still rife in Albania nearly a hundred years later, in the eighth and ninth decades of the seventh century;⁶ and who knows whether this unextinguished ember in Transcaucasia may not have been the source of the spark which flared up at Constantinople in A.D. 726 in a blaze of Greek fire? In A.D. 686 a Roman expeditionary force commanded by the Emperor Justinian II's general Leontius had not

¹ This Transcaucasian Albania was approximately coterminous with the Shirwân of the Islamic geographers and with the Republic of Azerbaijan in the political geography of the U.S.S.R.

² Der Nersessian, *op. cit.* pp. 70–71, on the authority of the Armenian Catholicos John of Odsun (*fungebatur* A.D. 717–28), who mentions this episode in a tract of his against the Paulicians.

³ The Kingdom of Armenia had been partitioned, by agreement, between the Sasanian and the Roman Empire *circa* A.D. 387–90 (see IX. viii. 413, n. 1). The Roman Imperial Government had ceded the lion's share of these spoils to the Sasanidae in the hope of thereby purchasing a relaxation of pressure on their Asiatic frontier which would allow them to concentrate their military efforts on the defence of their hard pressed frontier in Europe.

⁴ See Der Nersessian, *op. cit.*, p. 71.

⁵ This episode is recorded in a letter, written in A.D. 682 or 683 (see Der Nersessian, *ibid.*, p. 72) by Vardapat John Mayragometsi, the text of which has been preserved by Moses Kaghankavatsis in his *History of the Albanians*. A French translation of the Armenian text of this letter is given by Der Nersessian, *ibid.*, pp. 71–72. The three iconoclast monks' names, according to John Mayragometsi, were Thaddaeus, 'Hesu', and Gregory. Thaddaeus is also mentioned as a prominent iconoclast in the tract attributed to Vrt'anes K'ert'ogh (see p. 88, n. 2, above); and Vrt'anes' 'Isaiah' is perhaps identical with John's 'Hesu', though, in John's text, 'Hesu' probably stands for 'Joshua' (see Der Nersessian, *ibid.*, pp. 71 and 73).

⁶ John Mayragometsi, *op. cit.*, translated by Der Nersessian, *ibid.*, p. 71.

only recovered from the Primitive Muslim Arab invaders whatever part of Roman Armenia these may have occupied by that date, but had pushed on eastwards as far in that quarter as Roman arms had ever previously been carried even by Marcus Antonius or by Heraclius; and Albania, as well as Armenia, is named among the countries thus momentarily brought under Roman rule.¹ The local Romano-Arab hostilities that had been restarted by this Roman counter-offensive had continued until A.D. 693, when Armenia and Transcaucasia had been reconquered by the Arabs and been incorporated into the Umayyad Empire definitively.² We may guess that on this Armenian-Caucasian front, as on the Syrian front, the retreating Roman troops had been accompanied by civilian refugees, and that some of the Albanian and Armenian refugees may have been iconophobes who carried their doctrine with them westwards into the Armenian and Anatolic army corps districts of the East Roman Empire. Moreover, Caucasia, as we have noticed in other contexts,³ was the scene of the romantic exploits in which, *circa* A.D. 710-13,⁴ Leo Syrus won his spurs and paved his way to the East Roman imperial throne; and, according to the story, when Leo re-entered East Roman territory in order to become the Empire's saviour, he arrived, not alone, but at the head of a marooned East Roman force, extricated by him from the Western Caucasus, which was partly composed of Armenian troops.

In any case the evidence, cited above, attesting the vitality of the iconoclast cause in the Gallic and Caucasian extremities of Christendom, as well as in its Greek heart, during a period of some four hundred years precedent to the date at which an all-powerful East Roman Emperor made this cause his own, would explain how it was that, in Orthodox Christendom in A.D. 726, the ghost of a Judaic Iconophobia was able to assert itself so brusquely. In A.D. 726 this *revenant* did not have to be called up in a trice from the depths of Sheol; for by that date it had been hovering already for centuries round the flanks of a renegade Jewish Christian pilgrim's consciousness, on the wait for any opportunity to fasten upon his conscience.

In Orthodox Christendom the renaissance of a Judaic Iconophobia had a history not unlike that of the literary renaissance of Hellenism in the West. It broke out in two distinct eruptions (*aestuabant* A.D. 726-87 *et* A.D. 815-43),⁵ separated chronologically by an interval of quiescence;

¹ The names in the list given by Theophanes in his *Chronographia, sub Anno Mundi* 6178 (= A.D. 685-6), are Armenia, Iberia, Albania, 'Voukania', 'Media'. Since Iberia (= Eastern Georgia) and Albania (= Northern Azerbaijan) could not have been reached by a Roman army overland except via Persarmenia, the term 'Armenia' in this passage must be interpreted as including the whole country and not as being limited to the Roman territory of Erzerum. Theophanes' 'Media' may then be identified with Southern Azerbaijan, and his 'Voukania' with Varkāna (*Graecē* Hyrcania), i.e. the eastern section of the strip of territory between the Elburz Mountains and the Caspian Sea in which the Zoroastrians up to that time had kept the Arabs at bay (see II. ii. 446-7).

² See Bury, J. B.: *A History of the Later Roman Empire* (London 1889, Macmillan, 2 vols.), vol. ii, p. 322, n. 4, following St. Martin.

³ In I. i. 64, n. 3, and III. iii. 274-6.

⁴ For the date, see Bury, *op. cit.*, vol. ii, p. 376, n. 1.

⁵ The East Roman Emperor Leo V (*imperabat* A.D. 813-20), who re-inaugurated Leo Syrus's policy, was an Armenian, and his provenance may account for his proclivities, in the light of the evidence, noticed above, indicating that Iconophobia had been rife in Armenia already in the sixth and seventh centuries of the Christian Era.

and the augury of eventual failure that might be discerned in the intervening set-back was fulfilled when the illogical but statesmanlike compromise on which an iconoclast administration and an iconodule opposition in the East Roman Empire came to terms in A.D. 843¹ proved to have won for the Orthodox Church no mere ephemeral truce but a lasting peace in a theatre of ecclesiastical warfare in which the polemics had been flaring up, off and on, by that time for no less than five centuries.

This apparently permanent settlement of the controversy over images in Orthodox Christendom was not, however, the last that was to be heard of this vexed question in Christendom at large. The temporary re-establishment of the cult of images in Orthodox Christendom by the decisions of a council held at Nicaea in A.D. 787 evoked expressions of dissent and disapproval in Charlemagne's dominions;² and, though this protest in Frankland against Iconodulia was quashed at Rome by Pope Hadrian I (*fungebatur* A.D. 772-95), when he rejected Charlemagne's suggestion that he should co-operate with him in a joint condemnation of the Second Nicene Council's acts,³ the eruption in Transalpine Western Europe which these anticipatory rumblings portended did burst out at long last. A slow-growing Western Christendom had to wait, it is true, some eight hundred years longer for its Martin Luther than a precocious Orthodox Christendom had had to wait for its Leo Syrus; but, when the renaissance of a Jewish Iconophobia did break out in Western Christendom at length, the sixteenth-century explosion in

¹ See IV. iv. 364.

² In the *Libri Karolini* composed in Charlemagne's name by his ecclesiastical advisers in A.D. 790, the Fathers of the Second Nicene Council were taken to task on the ground that they had taken it upon themselves to declare the cult of images to be obligatory under pain of anathema, whereas, according to the iconodule Greek theologians' Frankish critics, the correct view was that the exhibition of pictures in churches was neither obligatory nor unlawful. Thereafter, at the council of Frankish bishops held at Frankfurt in A.D. 794, the acts of the Second Nicene Council were formally condemned on the false assumption (due apparently to a mistranslation) that the Fathers had awarded the same honours to the images as to the Holy Trinity (see Hodgkin, *Th.: Italy and her Invaders*, vol. viii, Book IX: *The Frankish Empire* (Oxford 1899, Clarendon Press), pp. 17-18).

This unfriendly reaction in Frankland to the Second Nicene Council's decisions was, no doubt, to some extent the reflection of a cultural antipathy between Western and Orthodox Christendom and a political rivalry between the Carolingian and the East Roman Power. In the intercourse between the two churches it was a cardinal principle of policy on either side that the other party must never be admitted to be in the right; and the position taken up by Frankish theologians in the *Libri Karolini* was nicely calculated to put Greek iconodules and Greek iconoclasts equally in the wrong. It is suggested by Hodgkin, *ibid.*, that Charlemagne's hostility to the full-blooded Christian Iconodulia of the Nicene Fathers may also have been partly inspired by his own personal experience in wrestling with the pagan idolatry of Saxon barbarians whom he was finding it difficult to subdue and convert. Though there seems to be no positive evidence to corroborate this conjecture, it is supported by an analogy between Charlemagne's experience and Muhammad's; for Muhammad's uncompromising Iconophobia was undoubtedly a reaction to the stubbornness of the idolaters to their pagan worship of the idols in the Ka'bah. Yet, when all due allowance is made for local and temporary considerations of a religious order, as well as for non-religious considerations of a cultural and political order, which may have played some part in inclining the Frankish Church to react unfavourably to the Second Nicene Council's Iconophilism, a recollection of the instances, noticed on pp. 89-90, above, of Iconophobia in Frankland as early as the sixth century of the Christian Era may lead us to look for the main cause of the manifestations of Iconophobia in Frankland in A.D. 790 and 794 beyond the horizon of current affairs, in an original and abiding Judaic element in Christianity. We must not leave out of our reckoning here the gaffly ghost of a Judaic Aniconism.

³ See Hodgkin, *ibid.*, pp. 18-19.

Germany was no less violent than the eighth-century explosion had been in Anatolia, while, as far as could be seen at the time of writing, rather more than four hundred years later, its effects showed signs of being much more persistent. This long delayed discharge of pent-up iconophobe feelings in a Western quarter of Christendom in which there had been evidence of such feelings since as early a date as the beginning of the fourth century, when they had found expression at the Council of Elvira, suggests that Christian consciences were haunted by the presence of a Judaic Iconophobia *semper et ubique*.

In a Protestant Reformation in Western Christendom an Aniconism that was one of the two fundamental tenets of Judaism was not the only Judaic ghost that succeeded in reasserting itself. A Judaic Sabbatarianism simultaneously captivated the sixteenth-century secessionists from the Roman Catholic Church; and the renaissance of this other element of Judaism in a Protestant Western Christianity is less easy to explain, since the extreme meticulousness to which a post-Exilic Jewry in diasporà had carried its observance of a Sabbath Day's rest prescribed in the Mosaic Law was a peculiar people's response to a peculiar challenge. Ritualism had been a Jewish diasporà's effective elixir for preserving its corporate existence as a community under conditions of adversity under which most other similarly placed communities had dissolved;¹ but, in a Modern Western Protestant Christian World, the triumph of a Judaizing Sabbatarianism was not confined to those Protestant communities which, like the Calvinist minorities in France and in Hungary, found themselves scattered abroad, *more Judaico*, among a Roman Catholic Gentile majority; the same Sabbatarianism captivated those Protestant communities in the Northern Netherlands, England, Scotland, the Scandinavian countries, and a number of autonomous Swiss cantons and German principalities and city-states in which the Protestants were masters in their own house.

It has been suggested that, in some, at least, of these cases, the 'reception' of a Judaic Sabbatarianism was an unconscious act of self protection against a demonic obsession with gainful economic activities which was so intense that it might soon have worn its votaries out if they had not providently reserved for themselves a salutary minimum of leisure by placing this under the sanction of a no less demonic superstition. But this psychological explanation of a Protestant Western Christian Sabbatarianism would appear to be ruled out by the historical fact that these Modern Western Protestant Christian communities had already become slaves of the Sabbath long before their enslavement to a power-driven mechanized industry capable of keeping its human slaves' noses to the grindstone for all the 168 hours in the week. What, then, are we to make of this paradoxical spectacle?

The Protestants' paramount objective was to return to the pristine practice of a Primitive Church; yet here we see them obliterating a difference of practice between Primitive Christianity and Judaism which the Primitive Church had introduced expressly to serve as a distinguishing mark. The Primitive Church had advertised its secession from Jewry by

¹ See IX. viii. 274.

transferring its weekly holy day from the Sabbath to the first day of the week; and the Protestants were now doing their best to cancel the intended effect of this Primitive Christian new departure by applying to 'the Lord's Day' both the Judaic name of the Sabbath and the Judaic tabu associated with it. Could these 'Bible Christians' be unaware of the logion 'the Sabbath was made for Man, and not Man for the Sabbath'?¹ Could they have read, without marking, the numerous passages in the Gospels,² illustrating this thesis, in which Jesus was reported to have gone out of his way to break the Sabbatarian tabu, and to have taken the offensive against the Pharisees by exposing the heartlessness of their legalistic observance of it? Could it have escaped the Protestants' notice that Paul, whom they delighted to honour above all the other Apostles, had made himself notorious by repudiating and denouncing the Mosaic Law, root and branch? The answer to all these questions is that, in appealing from the authority of the Papacy to the authority of the Bible, the Protestants had reanimated, not only the New Testament, but the Old Testament as well, and that, in a contest between these two resuscitated spirits for the dominion over Protestant souls, the spirit of Judaism had prevailed. The consequent renaissance of a Judaic Sabbatarianism was an impressive piece of testimony to the abiding potency of a ghost of Judaism by whose presence a Gentile Christianity had been haunted and harassed ever since its birth.

These renaissances of Judaic elements in Christianity, impressive though they may be, are not, of course, the only examples of the phenomenon in the field of Religion; and this chapter would be incomplete if we did not remind ourselves of other revivals of religious ideals and institutions in the histories of Christianity and of other higher religions. A Christianity which had eventually committed itself to a 'Conceptionist' Christology lived to be haunted by a repressed 'Adoptionism' when a Paulician fossil of a submerged Adoptionist Church struck sparks of Bogomilism by its impact on Slavonic-speaking Orthodox Christians in South-Eastern Europe, and sparks of Catharism by its subsequent impact on Romance-speaking Western Catholic Christians in Lombardy and Languedoc.³ And a Western Christian Church that had barely succeeded in exorcizing Catharism by the simultaneous practice of a Dominican violence and a Franciscan gentleness lived on to be haunted by a ghost of Augustinian predestinarianism which Jansen raised within the newly fortified precincts of a Tridentine Catholicism after Calvin had raised it in the camp of a rebellious Protestantism.⁴ In the history of Islam an Iranic Muslim Society that had emerged out of a post-'Abbasid social interregnum was rent asunder, in the spring of its growth, by the Safawis' sudden evocation of a ghost of Imāmī Shi'ism at the turn of the fifteenth and sixteenth centuries of the Christian Era;⁵ and thereafter an Arabic Muslim Society which had been forcibly incorporated into an Ottoman World, as a consequence of a 'war of religion' between the 'Osmanlis and

the Safawīs, raised ghosts of a Primitive Muslim puritanism in the successive explosions of Wahhābī, Sanūsī, Mahdist, and Idrīsī Zealots.¹

(III) THE ROLE OF PILGRIMAGES IN RENAISSANCES

In our survey of renaissances down to this point, we have been reconnoitring, one by one, the principal channels of social life and taking note of the instances, in each line of activity, of the phenomenon that we are studying in this Part. The necromancer's feat of evoking ghosts from the dead pasts of extinct civilizations has been found to have different effects in these divers departments of a living social milieu; but there is one feature, of a geographical order, that is common to all the cases that we have reviewed so far. Whatever differences these divers kinds of renaissance may display in other respects, they all uniformly manifest themselves in changes in the life of a living society that take place within the limits of the society's native geographical habitat. If our survey is to be complete, we must now go on to notice a geographical effect, beyond those limits, that may also be produced by a renaissance of any kind. The evocation of a ghost of some element, whatever it may be, in an antecedent culture may move the haunted society to break its own geographical bounds by trespassing on ground that lies outside these but within the former habitat of the dead predecessor with which the living trespasser is seeking to enter into communion.

Such attempts to translate renaissances from the Time-dimension into the Space-dimension had played an important part in the history of the contacts between civilizations because, as we have seen in an earlier context, the breach of temporal continuity between an antecedent society and its successor or successors in the next generation had often been accompanied by a breach of spatial continuity between the earlier and the later society's respective territorial domains. Though there had been affiliated societies whose habitats had been virtually co-extensive with those of their predecessors, there seemed to have been a greater number of cases—perhaps nine, as against six—in which the geographical coincidence had been only partial, or in which there had been no geographical coincidence at all.² In cases of these two latter kinds, a cultural renaissance is apt to produce a geographical tension; for a living society that is haunted by a ghost is prone to treat as holy ground³ the scene of the *revenant's* acts and experiences in its original epiphany as a creature of flesh and blood; and holy ground exerts a potent attraction, because it seems to offer a tangible medium of communication between a pious living votary and the elusively spectral object of his devotion. If the votary can continue to set foot in the holy land, he will be able to stand in the footprints of the saints and perhaps to see, touch, and adore their bones, their tombs, and other abiding material relics of their transitory life on Earth. Thus, in all cases where there has been a total or partial geographical displacement of an affiliated civilization's habitat from the

¹ See V. v. 295 and 329; V. vi. 227; IX. viii. 250 and 602.

² See the table in I. i. 132.

³ Exod. iii. 5.

locus of its predecessor's habitat, one of the ways in which a renaissance is apt to seek expression and satisfaction is through the institution of Pilgrimage.

This institution is not, of course, a by-product of renaissances; it is much older and far more widespread. Pilgrimages must have begun to be made by Mankind wherever and whenever one local shrine came to surpass its neighbours in prestige to a degree that moved the regular local votaries of the neighbouring shrines to reinsure their claim on the good graces of the *numina* by paying occasional or periodical visits to the pre-eminent shrine as well. This practice is not peculiar to any single species of society. We find it rife in the primitive societies as well as in the civilizations, and the greatest dimensions ever attained by any pilgrimages down to the time of writing had been in the lives of universal churches embodying 'higher religions'. Whether we measure these dimensions in quantitative terms of the numbers of the pilgrims, the linear mileage of their travels, and the square mileage of their catchment area, or whether we reckon in qualitative terms of the spiritual effect on the corporate life of a church and on the individual lives of its adherents, we shall arrive at the conclusion that the pilgrimages instituted by Buddhism, Christianity, Hinduism, and Islam, and by the divers sects into which each of these oecumenical religious societies had broken up, were to be reckoned among the most important human institutions of any kind that had been in operation within the two millennia ending *circa* A.D. 1950. In a Judaic religious *oikoumenê* a Jerusalem which had been hallowed by Jews, Christians, and Muslims alike had outstripped the exclusively Christian holy cities Bethlehem and Nazareth, as well as the exclusively Muslim Mecca and Medina. But who shall say whether the *mana* of the Haram-ash-Sharîf and the Church of the Holy Sepulchre and the Wailing Wall was greater in the aggregate than the *mana* of a Bodh Gayâ which, in an Indic religious *oikoumenê*, was the supreme goal of every Buddhist pilgrim's aspirations?

The inauguration of pilgrimages on an oecumenical scale which accompanied the propagation of the higher religions to the ends of the Earth was inevitably followed by a reaction in favour of pilgrimages of a narrower range. Any pilgrims would be tempted to travel less far afield, into less strange and hostile social milieux, if they could be assured that, in choosing an easier option, they would be earning an undiminished amount of spiritual merit; and their ecclesiastical pastors and masters might be inclined to give them such assurances under the influence of mixed motives, including a circumspect reluctance to lay on their sheep's shoulders a burden too grievous to be borne,¹ as well as a politic desire to keep their flock within geographical bounds within which they would not be exposed to any rival religious influences. For these reasons, every secession of a sect from a universal church, and every emergence of a secular civilization from an ecclesiastical chrysalis, was apt to be followed by the establishment of new goals of pilgrimage, nearer home, as at least partial substitutes for the Haramayn, Jerusalem, or Bodh Gayâ.

¹ Matt. xxiii. 4.

A classic example of the narrowing of a pilgrimage-horizon was to be found in the history of the holy places of the Shī'ah. Within less than a hundred years of the date of the Hijrah, Mecca and Medina, the two oecumenical Islamic holy cities in the Hijāz, had been partially supplanted, as goals of pilgrimage for Shī'i Muslims, by two sectarian holy cities in 'Irāq—Najaf and Karbalā—that had been sanctified by the martyrdoms of an 'Alī and a Husayn; and these 'Irāqī cynosures of the Shī'ah had afterwards been supplemented by the tombs of an Imāmī Shī'ah's seventh and ninth imāms, Mūsā al-Kāzim and Muhammad al-Jawād, at Kāzimayn. When, in the sixteenth century of the Christian Era, the career of the Safawī Imāmī Shī'ite empire-builder Shāh Ismā'il resulted in 'Irāq's losing to Iran the position, enjoyed by 'Irāq for more than eight hundred years down to that date, of being the principal stronghold of this 'Twelve-Imām' variety of Shi'ism,¹ and when, thereafter, 'Irāq itself fell under the dominion of the Safawīs' Sunnī arch-enemies the 'Osmanlis,² it became the policy of a Safawī imperial régime to discourage its Shī'i subjects from making pilgrimages even to the historic holy places of the Shī'ah in an Arab 'Irāq that was now in hostile Ottoman Turkish Sunnī hands, and to divert their hungry eyes with the lure of competitive cynosures inside the Safawī Empire's political frontiers. Persian pilgrims heading for Karbalā and Mecca were provided with alternative goals *en route* at Qumm and Qāshān in a Persian 'Irāq where they could slake their spiritual thirst at a lower cost in money, fatigue, and danger without having to descend from their temperate native plateau to the sultry lowlands at its western foot, or to make the arduous transit of the Arabian desert between the Shī'i Muslim holy cities on the Lower Euphrates and the oecumenical Muslim holy cities in the neighbourhood of the Red Sea. Better still, these Persian Shī'i pilgrims could be induced not merely to stop short of the Qiblah, but to turn their backs on it, by being directed towards the Mashhad of the Imām Rizā in Khurāsān, in the north-eastern corner of the Safawī dominions.³

This Shī'ite Muslim story has Far Eastern Buddhist and Western and Orthodox Christian parallels.

After the propagation of the Mahāyāna into the domain of a disintegrating Sinic Civilization, the converts to this oecumenical higher religion in a nascent Far Eastern World were inspired with a zeal to visit the scenes of the Buddha's life and work in Northern India; and surviving records of journeys made by Chinese pilgrims to the holy land of Buddhism in the course of a span of years beginning in A.D. 259 and ending *circa* A.D. 1050⁴ showed that the practice had been at its height in the fifth, sixth, and seventh centuries of the Christian Era. This *floruit* is surprising at first sight, considering that the more frequented pilgrims' way was not the sea-route from the south-east coast of China to the Bay of Bengal but the land-route via the Tarim Basin and the Oxus-Jaxartes

¹ See I. i. 366-400, together with the note by Professor H. A. R. Gibb, *ibid.*, pp. 400-2.

² See I. i. 389-90.

³ See I. i. 392.

⁴ See Goodrich, L. C.: *A Short History of the Chinese People* (London 1948, Allen & Unwin), pp. 64 and 156.

Basin and the passes into the Indus Basin over the Hindu Kush; for the period during which the overland pilgrimage from China to India was enjoying its *floruit* approximately coincided with a period, running from *circa* A.D. 375 to *circa* A.D. 675, when the Eurasian Nomads were in a state of effervescence,¹ and when the perils braved by pilgrims on the overland route were consequently at a maximum.

Why should this route have been frequented by Chinese pilgrims during these particularly hazardous centuries, and deserted in the course of the next three hundred years, though these were times in which the Nomads were relatively quiescent? No doubt, one element in the answer is that the incentive of the merit to be earned by making the pilgrimage counted for more in Chinese Buddhist minds than the deterrent of the dangers that had to be faced. On this reckoning, the greater the peril, the greater the virtue of braving it; and accordingly the pilgrimage from China to India flourished, in spite, or perhaps rather because, of its hazardousness, so long as a distant holy land in Bihār was the only pilgrimage-resort where the Chinese pilgrim could hope to earn the merit that was the object of his quest. From the same angle of vision, we can also see that the stream of Chinese pilgrims to Bodh Gayā would be likely to dwindle, and finally to run dry, when a Mahāyāna that had long since taken root on Chinese soil begat there, in the fullness of time, a number of local Far Eastern Buddhist holy places—Wu-T'ai Shan in Shansi, Omei in Szechwan, and the like—whose gradually accumulated *mana*² eventually came to rival in the Chinese Buddhist community's estimation the *mana* of a Bodh Gayā in a once Buddhist Hindustan where in the meantime Buddhism had been progressively giving place to Hinduism.

In the same fashion, both an Orthodox and a Western Christendom eventually begat substitutes, within their own respective ecclesiastical bounds, for an oecumenical Christianity's original holy places in a Palestine that had fallen under Muslim rule in the seventh century of the Christian Era. In the tenth century, Orthodox Christendom provided itself with an equivalent of the Chinese Buddhists' Wu-t'ai Shan in 'The Holy Mountain' Athos, lapped by the waters of the Aegean, where in later times Russian pilgrims *en route* for Palestine could be induced to break their journey and to part with a portion of their offerings. A Russian pilgrim who wished to earn his merit still nearer home, without having to cross the sea, could content himself with visiting the shrine of a local theotókos in a north-eastern outpost of the Islamic World at Qāzān which had been won for Muscovy and Orthodoxy by the Tsar Ivan IV in A.D. 1552. A Greek pilgrim who did not wish to venture beyond the landlocked waters of an Archipelago which he had hallowed for himself as 'the Sacred Sea' could earn his merit no less conveniently by making his pilgrimage to the island of Tinos. In Western Christendom, *pari passu*, the Papacy encouraged a pilgrim *en route* for Jerusalem from the Transalpine ecclesiastical dominions of the Holy See

¹ See III. iii. 414.

² Wu-t'ai Shan, for instance, had already acquired such sanctity by the time of the great persecution of Buddhism in China in A.D. 845 that it was rehabilitated thereafter as early as A.D. 857 (Goodrich, *op. cit.*, p. 127).

to break his journey, and lighten his purse, at Rome;¹ but Rome, in her turn, had to part with some of the custom thus captured by her from Jerusalem to younger holy places more conveniently placed than Rome herself. A pilgrim heading towards Rome from Lombardy might earn his merit and spend his money nearer home at Loreto; and a devout native of England might make his pilgrimage to Canterbury or Walsingham without having to leave the shores of his insular *alter orbis*.² It was left for France to emulate in a nineteenth-century Western Christendom the feat achieved by Khurāsān in a sixteenth-century Shi'ite fraction of Dār-al-Islām. At Mashhad, Khurāsān had given birth to a shrine that would draw Shi'i Muslim pilgrims in the opposite direction from Qarbalā and Mecca. At Lourdes and at Lisieux, France similarly gave birth to shrines that could draw Roman Catholic Christian pilgrims in the opposite direction from Rome and Jerusalem.

The foregoing examples illustrate the tendency of a pilgrimage-horizon to contract from the oecumenical range set for it by the world-wide expansion of a universal church to the parochial limits of sects, civilizations, and states. This tendency towards a narrowing of the horizon on the religious plane had, however, sometimes been checked or reversed by a counter-tendency on the military, political, and economic planes. This counter-movement would be set in motion by an impulse to recapture by main force a lost hold upon some site that was still holy ground in the now militant pilgrims' eyes in virtue of its having been the birthplace of their society's chrysalis-church; and such impulses were the offspring of renaissances, since they were responses to the appeal of a ghost who had risen from the dead to exercise his powers of fascination upon the living.

A classic example of a renaissance thus expressing itself geographically in a militant movement of expansion is the explosion of a Medieval Western Christendom in the Mediterranean in the Crusades.³ In effect the Crusades were assaults made by Medieval Western Christian aggressors on the contemporary domains of their living Muslim and Orthodox Christian neighbours; but the conscious motive of these Western Christian invasions of Dār-al-Islām and Orthodox Christendom was a yearning to incorporate in the Western Christian body social the birthplace of another society that was not a rival civilization but was the Western Civilization's own mother church. The Crusaders were seeking to gain possession of a Palestine that was prized by them not so much on account of its present strategic and economic value as for the sake of those historical associations with the origins and antecedents of Christianity that had long since made Bethlehem, Nazareth, and Jerusalem the goals of pacific Christian pilgrims. 'It was the pilgrimage to Jerusalem, and not the Levant trade of Pisa and Genoa, that inspired the Crusading Movement'.⁴

¹ Rome had become a goal of Western Christian pilgrims before the end of the fourth century. See Bardy, G.: 'Pèlerinages à Rome vers la Fin du iv^e Siècle', in *Analecta Bollandiana*, vol. i, pp. 224-35.

² See I. i. 17-18.

³ See I. i. 38 and IX. viii. 346-63.

⁴ Dawson, Christopher: *Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), p. 203.

In taking up arms under the impulse of this homesickness for their pristine holy land, the Crusaders not only made for Christendom's oldest and most sacred pilgrimage-resort as their ultimate objective; they also set themselves intermediate goals to draw their flagging feet forward along the intervening stages of their long war-path by throwing out, *en route*, new pilgrimage-resorts in advanced posts just beyond an expanding Western Christendom's previous borders. Norman pilgrimages to the shrine of Saint Michael the Archangel on Monte Gargano, in the Apulian dominions of the East Roman Empire, were reconnaissances that became preludes to a Norman conquest of the bridgeheads of Orthodox Christendom and Dār-al-Islām in Southern Italy and Sicily,¹ and French pilgrimages to the shrine of Saint James the Apostle at Compostela, in a Galician no-man's-land between a Western Christian fastness in Asturia² and the former domain of a dissolving Andalusian Umayyad Caliphate, provided successive new drafts of military manpower for the progressive conquest of the Iberian Peninsula by the joint efforts of Cispyrenean and Transpyrenean Frankish aggressors.³

The perilous exposure of the shrine at Compostela on the fringe of a Medieval Western Christendom's *dār-al-harb* had the same effect in spurring the Crusaders into making superhuman exertions as the desperate deed of a Scottish knight who, on an Andalusian battlefield where he had broken his pilgrimage in order to fight under a Castilian banner, turned the fortunes of a day which had been going against the Franks by flinging into the midst of the all-but-victorious Muslims a silver casket containing Robert the Bruce's heart, and rushing forward after it to conquer or die for the sake of rescuing a treasure, entrusted to his safe-keeping, which he had thus deliberately thrown into jeopardy as a last resort for calling out his own supreme reserves of vigour and valour.⁴ This incident was an omen; for the mission which the Bruce on his death-bed had charged his companion in arms, James Douglas, to fulfil had been to carry his heart to Jerusalem in order to bury it there in the Church of the Holy Sepulchre; the attainment of this Palestinian objective was sacrificed for the sake of a Frankish victory on Andalusian ground which was won by Douglas at the cost of the martial pilgrim's own life; and this personal story repeated itself on an oecumenical scale. While the last of the Crusaders' bridgeheads on the coast of Syria was lost within less than two hundred years of the Frankish invaders' first descent upon Palestine, their conquests in the Iberian Peninsula, Southern Italy, and Sicily under the auspices of the far-flung shrines at Compostela and Gargano were the two abiding gains of territory that were made by Western Christendom in the Crusades at Dār-al-Islām's and Orthodox Christendom's expense.

Elsewhere, and above all in Palestine, the Crusades were the failure that is the usual nemesis of attempts to reach religious goals by military short-cuts; but the Western Christians' yearning for the holy land of Christendom, which had found its earliest expression in these misguided

⁴ The tale is told by the writer's mother, Edith Toynbee, in *True Stories from Scottish History* (London 1896, Griffith Farran Browne), pp. 90-91.

Frankish military enterprises, was too deeply ingrained in Western Christian hearts to be expunged by the mortification of a military fiasco. More than five and a half centuries after the Mamlûks had evicted the last of the Crusaders from Acre, a dispute between Western Christian and Orthodox Christian ecclesiastical authorities over their respective rights in Christendom's Palestinian holy places provided the diplomacy of a *ci-devant* Christian World with an occasion for making the Crimean War. The same abiding Western Christian interest in the Christian Holy Land also found sincere and innocent expressions in the same century in the inauguration of The Palestine Exploration Fund by British 'Bible Christians' in A.D. 1864 and the establishment of a Protestant bishopric at Jerusalem under the joint auspices of the English and Prussian Crowns in A.D. 1841.¹ In the twentieth century the fascination of the Christian Holy Land was still strong enough to lure Victorian British 'Bible Christians' grandchildren into implicating themselves in a shirt of Nessus when they succumbed to the temptation to undertake a mandate for the administration of Palestine on terms that were bound to disappoint either the Arab natives of the country or the Zionist immigrants of the great expectations which these ambiguous terms could not fail to create in the minds of both parties.²

Perhaps the most impressive of all latter-day testimonies to the tenacity of the Christian Holy Land's hold on Western Christian imaginations and affections were the North American Protestant mission-stations which, in the course of the nineteenth century, were established at key-points in the Ottoman countries and in Persia. The founders and propagators of these American Protestant missions in South-East Europe and South-West Asia were descendants of pioneers who had plucked up their roots in the Old World and shaken its dust from off their feet³ in order to clear the ground for the creation of a New World on the other side of the Atlantic. These transoceanic emigrants from England who had put their hand to the plough that was to call a New England into existence were duly inhibited, by a warning text,⁴ from looking back over their shoulder towards their English mother land; but, in boldly choosing and steadfastly following this arduous course, the Pilgrim Fathers had been inspired by the Biblical myth of a Chosen People enduring the ordeal of the wilderness for the sake of making their way into a Promised Land;⁵ and, in thus identifying the *Mayflower's* historic

¹ 'There is an Anglican bishop resident in Jerusalem. Previous to A.D. 1887 he was appointed by the Queen of England and the King of Prussia alternately. Three bishops held office under this arrangement (A.D. 1841-1881)' (British Admiralty, Naval Staff, Intelligence Division, Geographical Section: *A Handbook of Syria (including Palestine)* (London, N.D., H.M. Stationery Office), p. 209).

² 'As to the project of a Jerusalem bishopric, I never heard of any good or harm it has ever done, except what it has done for me' (Newman, J. H.: *Apologia pro Vita Sua* (London 1890, Longmans Green), p. 146).

³ For Newman, the crucial points were that this concerted action of the English and Prussian crowns convicted the Established Church of England of being in communion with the united Lutheran-Calvinist Protestant Church of Prussia, and that in an Act of the Parliament at Westminster, in execution of the project, the Church of England was labelled 'Protestant' expressly (see *ibid.*, pp. 141-6).

Gentile Christian human freight with a legendary Mosaic Israel, they were fortifying one of their emotional links with the Old World in the act of nerving themselves to sever another; for, though any lingering home-sickness for England that might have persisted in their hearts would have been condemned by their consciences and repressed by their wills as a hankering after the fleshpots of Egypt¹ which would indeed have proved them unfit for the Kingdom of God, there was no counter-text in the Bible to harden their hearts against the appeal of texts² summoning them to succour scattered and shepherdless Christian sheep in 'Bible Lands' where the labourers were few. The nineteenth-century descendants of seventeenth-century Pilgrim Fathers who dedicated their lives, from father to daughter and from mother to son, to the service of American missionary institutions at Bayrūt, Smyrna, Constantinople, Merzifün, and a dozen other stations in the Near and Middle East were pilgrims still, as their fathers had been before them;³ and, when they thus turned right-about-face, to make the return-voyage eastward-ho across the Atlantic from the Fair Havens⁴ of an American New Canaan⁵ to Levantine scalas at which Saint Paul had once embarked and disembarked, instead of pressing on westward to a Salt Lake or a Klondyke, they were showing their loyalty to their ancestral faith by responding to a call of 'Bible Lands' which was stronger than their dread of re-entangling themselves in an Old-World city of destruction.

The call of a holy land in *partibus alienis*, which thus continued to re-echo in Western Christian ears down a corridor of Time stretching from 'the Dark Ages' to the twentieth century of the Christian Era, likewise availed, in the ninth century of the Islamic Era, to move the Iranic Muslim 'Ghāzis of Rūm'⁶ to trespass on Arabic Muslim ground by annexing an Egyptian Mamlūk Empire which included among its dominions the Islamic Holy Land in the Hijāz. The last Egyptian Mamlūk Sultan Tūmān Bey's Ottoman conqueror, Sultan Selīm I, who did not deign to relieve the Mamlūks' puppet Cairene 'Abbasid Caliph of a Caliphial title which Selīm I's forebears had already usurped,⁷ was proud to number among the fruits of his portentous victory the privilege of becoming the guardian of the Holy Places of Islam;⁸ and, some three hundred years later, his successor Sultan Selīm III (*imperabat* A.D. 1789-1807) was confronted with the choice between vindicating his claim to this still-treasured ancestral office by effective action or else suffering a politically disastrous loss of face in orthodox Sunnī Muslim eyes when, in A.D. 1803, the Sunnī Muslim World was cut to the heart by the shocking news that the impiously militant Wahhābī sectaries had made a descent upon the Hijāz. The Pādishāh at Constantinople was constrained to discharge his bounden duty vicariously by instructing his virtually self-appointed viceroy in Egypt, Mehmed 'Alī,⁹ to act on his

nominal lord and master's behalf; and, though the ensuing conquest of the Wahhābīs' homeland and fastness in the Najd by Egyptian Ottoman arms proved ephemeral,¹ Mehmed 'Alī's execution of the Sublime Porte's commands did have the effect of making the Hijāz safe again for Sunnī Muslim pilgrims by liberating the Islamic Holy Land in A.D. 1812 from a Wahhābī domination that was not re-established thereafter until A.D. 1924-5.

The intermission of the annual pilgrimage to the Holy Cities of the Hijāz under threat of Wahhābī attack had been singled out by the eminent Egyptian Muslim historian Jabartī as being, in his estimation, the most important event of a year A.H. 1213 (A.D. 1798-9) which had also witnessed the descent on Egypt of a French expeditionary force;² and neither the eventual reconquest of the Hijāz by a resurgent Wahhābī Power in A.D. 1924-5 nor the simultaneous triumph of a secularizing movement *alla Franca* in the Ottoman Empire's republican Turkish successor-state availed to dry up a pilgrimage-stream whose convergent waters were fed from a catchment area extending as far west as the Senegal and as far east as Indonesia.

The military measures twice taken by an Ottoman Sunnī Muslim Power in order to bring the Hijāz under its aegis, and thereby ensure due access to Mecca and Medina for Sunnī Muslim pilgrims from all parts of a Sunnī Muslim World, had their counterparts in the repeated attempts of the Safawīs and their successor Nādir Shāh to reverse the military decisions of the years A.D. 1534 and 1546³ by reconquering from their 'Osmanli adversaries an Arab 'Irāq which contained the oldest and most venerable holy cities of the Shi'ah; and in the present context we may also remind ourselves that the 'Osmanlis' descent from the Anatolian Plateau upon the lowlands to the south of the Taurus in A.D. 1516-17 had been anticipated by the East Romans in and after A.D. 926⁴ in a repeatedly renewed offensive culminating in A.D. 999 in a raid which had brought East Roman armies as far south as Tarabulus—more than half the length of the road from the Cilician Gates to Jerusalem—a hundred years before any Western Christian Crusader set foot on Syrian ground.

This expansion of the East Roman Empire southward into Syria in the tenth century of the Christian Era, like the expansion of the Ottoman Empire in the same direction in the sixteenth century, was, no doubt, partly the almost automatic consequence of a local change in a balance of military and political power. The decline of the Mamlūk polity, which gave the opening for the 'Osmanlis' sixteenth-century swoop upon Syria and Egypt, had its counterpart in the tenth century in an enfeeblement of Islam through the break-up of the 'Abbasid Caliphate. Is there any evidence that the East Roman aggressors, too, were partly moved, as the 'Osmanli aggressors appear to have been, by an aspiration to bring under their aegis the holy places of their religion? A longing to wrest the Holy Land of Christendom out of non-Christian hands had once inspired the

Roman Emperor Heraclius and his subjects to persevere, in the face of an apparently irretrievable defeat, in waging the last and worst of the Romano-Persian wars (*gerebatur* A.D. 603-28) until they had liberated Christendom's holy city Jerusalem from a Zoroastrian domination and had recovered a Holy Rood which had been removed by sacrilegious Persian hands in A.D. 614. The same ardent feeling for the same Christian Holy Land was to be the loadstone of Western Christian Crusaders' efforts a hundred years after the time of Basil II's two Syrian campaigns. When the Eastern Orthodox Christian warrior-emperors Niki-phóros Phokàs (*imperabat* A.D. 963-9), John Tzimiskes (*imperabat* A.D. 969-76), and Basil II (*imperabat* A.D. 969-1025) successively invaded Syria, were they moved in part by the same nostalgia for the cradle of Christianity?

If the master-motive of Basil's raid in the direction of Palestine in A.D. 999 had indeed been a crusader's zeal, it would be difficult—even after making full allowance for Basil's double preoccupation with the Great Romano-Bulgarian war on a distant European front and with the repeated rebellions of feudal magnates in the Anatolian heart of his dominions¹—to understand how in A.D. 1001 Basil could have brought himself to conclude a ten-years' truce with the 'Fātimid' Power under which the Syrian arena was partitioned between the two empires along a line running, far out of range of Jerusalem, from a point on the shore of the Mediterranean, just to the north of Tartūs (Antaradus), to a point on the bank of the River Orontes just to the south of Shayzar (Caesarea).² It would be even more difficult to understand why in A.D. 1009 Basil did not break the truce, even at the cost of interrupting his war-to-the-death with Bulgaria, as he had interrupted it once before in A.D. 995, in order to transfer his striking force to a Syrian theatre of operations. In A.D. 995 Basil had made a forced march across Anatolia for the sake of saving Aleppo from falling into the hands of the 'Fātimid' Power; in A.D. 1009 what was at stake in Syria was not the fortress of Aleppo but the Church of the Holy Sepulchre at Jerusalem. In A.D. 1009 this Christian holy place was pillaged and rased by order of the 'Fātimid' Caliph Hākim (*imperabat* A.D. 996-1020).³ Yet Basil made no military move either to prevent the outrage or to avenge it.

There are, nevertheless, some indications that Basil II, as well as his successors Constantine VIII (IX) (*imperabat solus* A.D. 1025-8) and Constantine IX (X) Monomákhos (*imperabat* A.D. 1042-54), was partly moved by a genuine concern for the Palestinian holy places. In A.D. 987-8, seven years before his first Syrian campaign, Basil himself had sent a mission to Cairo charged with funds for the upkeep of the Church of the Holy Sepulchre at Jerusalem.⁴ In A.D. 1027 Constantine VIII negotiated with the 'Fātimid' Government a treaty empowering him to undertake the restoration of the church, which Hākim had destroyed in the meantime. This treaty was renewed in A.D. 1036; and the actual work of

¹ See IV. iv. 390-3 and 396-7.

³ See V. v. 683-5.

⁴ See Runciman, op. cit., p. 34, n. 1.

rebuilding was carried out by Constantine Monomákhos some ten years after that.¹

'To supervise the work, imperial officials voyaged freely to Jerusalem, where, to the disgust of Muslim citizens and travellers, the Christians seemed to be in complete control. So many Byzantines were to be seen in its streets that the rumour arose amongst the Muslims that the Emperor himself had made the journey.'²

These facts suggest that the East Romans were not indifferent to the appeal of the Christian Holy Land; yet the full strength of its hold on Orthodox Christian affections and imaginations was only to be demonstrated some three hundred years and more after the last vestiges of the East Roman Empire had been obliterated by an Ottoman conqueror, when a 'Holy Russia' that had not been converted till A.D. 989,³ six years before the date of the first of the East Roman Emperor Basil II's two raids into Palestine, tardily vindicated her pretension to be 'the Third Rome'⁴ by constituting herself the champion of the Orthodox Church throughout the Ottoman Empire,⁵ and, above all, in the Palestinian holy places.

In taking up this cause on the morrow of the decisive Russian victory in the Great Russo-Turkish War of A.D. 1768-74, a secular-minded Westernizing Petrine Imperial Russian Government was, no doubt, exploiting its subjects' religious feelings for the furtherance of political ambitions of its own which, in the Crimean War, were eventually to lead the Russian Empire into military and political disaster; but the sincerity of the Russian peasantry's devotion to the Holy Land was attested by the volume of an annual pilgrimage-stream that used to roll through the Bosphorus and Dardanelles till it broke on the coast of Palestine after sweeping over the promontory of Athos. The aspiration to make the pilgrimage to their holy places came to play as dominant a part in the Russians' life as in the Muslims'; and in the World War of A.D. 1914-18 an Imperial Russian Government at its last gasp obstinately vetoed all Western suggestions for establishing a Jewish National Home in Palestine on the ground that this would create an intolerable eye-sore for Russian pilgrims to Orthodox Christendom's Holy Land. In A.D. 1917 the Tsardom had to fall on the 12th March before the Balfour Declaration could be published on the 2nd November.

If we now pass on to inquire whether there are examples of renaissances expressing themselves in geographical terms in cases in which two civilizations of different generations have been related to one another in some other way than through the link of a chrysalis-church, we may glance first at instances in which the successor-society has been a civilization of the second generation, and the predecessor-society a civilization of the first generation which has not bequeathed any universal church to the affiliated civilization, and we may then proceed to examine instances in which a civilization of the third generation that has been related to an antecedent civilization of the second generation through a chrysalis-church has also come into direct contact with its predecessor

¹ See Runciman, *op. cit.*, p. 36.

⁵ See IX. viii. 127, n. 2.

outside the field in which the chrysalis-church has served as an intermediary.

The south-eastward movement of expansion out of an Anatolian homeland into 'the Fertile Crescent' between the Taurus and the North Arabian Desert, which we have seen a Sunnī Iranic Muslim Ottoman Empire making in the sixteenth century of the Christian Era, and an Orthodox Christian East Roman Empire in the tenth century, had been anticipated in the fourteenth and thirteenth centuries B.C. by a Khatti Empire that had established its hegemony over an Anatolian Hittite World; but there is nothing to suggest that this Hittite Power's aggressive expansion south-east of the Taurus in this age, or even its earlier raid on Babylon, was consciously inspired by any pious yearning to gain possession of an antecedent Sumeric Civilization's birthplace in the Land of Shinar. We have still less warrant for imagining that the Toltec military adventurers from a Mexic World who established themselves, first as mercenaries and then as masters, in the domain of a sister society in Yucatan¹ had been drawn in this direction by any yearning to set eyes on the Guatemalan homeland of an antecedent Mayan Civilization to which the Yucatec and the Mexic Society were both affiliated.

Orthodox Christian and Western Christian military adventurers conquered and reconquered the Continental European Greek homeland of an Hellenic Civilization which was the parent of both these mutually antipathetic Christian Hellenistic societies, and here the evidence would seem to give us grounds for pronouncing, with some confidence, that these efforts to seize and hold Greece, energetic and persistent though they were, were not inspired by any conscious feeling of piety towards a treasured past such as moved the Western Crusaders to seize and hold Palestine.

When the Byzantines conquered Greece from pagan Slav barbarian squatters there in the reign of the East Roman Emperor Basil I (*imperator* A.D. 867-86), and again when they afterwards recaptured it from schismatic Western Christian usurpers, foot by foot, in the course of 168 years running from A.D. 1262 to A.D. 1430, the value of Greece in Byzantine eyes, which induced the Byzantines to make these strenuous military efforts for the sake of gaining possession of it, did not, as far as we can judge, reside in the historic role that Greece had once played as the birthplace of Hellenism. The motive that moved Basil I to conquer Greece seems to have been, not cultural piety, but a strategico-political calculation. He appears to have been seeking to forestall the danger that, if he did not occupy Greece himself, it might fall into the hands of a rival Bulgarian Power, which, during Basil's reign, was rapidly appropriating the lion's share of the hitherto independent Slaviniæ in the interior of the Balkan Peninsula;² and, when the Palaiologhi persisted in squandering the rapidly dwindling resources of a precariously restored East Roman Empire on the luxury of reconquering the Morea from the Latins, instead of concentrating their military efforts on the defence of their last bridgeheads in Anatolia against Turkish assailants whose knife was then already at Byzantium's throat, they would appear to have

¹ See I. i. 123-4 and IX. viii. 315.

² See IV. iv. 343.

been moved by a short-sighted eagerness to turn to immediate account the military weakness of Frankish trespassers on East Roman ground who had become even more decrepit than the Byzantine lawful owners. In reconquering the Morea from the Latins, the Palaiológhi were providently securing the twofold immediate satisfaction of taking their revenge for grievous wrongs suffered in the past at the hands of hated schismatic Christian aggressors and at the same time momentarily compensating themselves for irreparable losses of strategically invaluable territory in Anatolia with ephemeral gains of strategically valueless territory in Rumelia. The Palaiológhi chose to act on this short view without reflecting that, in expelling the Franks from the Morea, they were working, not for themselves, but for their future Ottoman successors. Yet, unstatesmanlike though their preoccupation with the Morea may look in retrospect to an historian's eye, there is no evidence that the warping of their political judgement was the effect of any sentimental attachment to a country that had once been the cradle of Hellenism.

In the vocabulary of a Greek Orthodox Christendom the word 'Hellene' had acquired the opprobriously pejorative connotation of the English Western Christian word 'heathen';¹ and, in the sixth, no less than in the first, century of a progressive renaissance of the Ancient Greek language and literature in Byzantium that had started in the generation of Photius (*vivebat circa* A.D. 820-91), this was still the first association that the word 'Hellene' would spontaneously suggest in the minds of Byzantine Hellenists, however pedantically they might have schooled themselves to conform to the literary affectation of using the term in its original laudatory sense, in imitation of its usage in the classical works of Hellenic literature which they had consciously taken as their models. Moreover, even the most affectedly self-conscious Byzantine votary of an Hellenic literary culture would never have answered 'Hellas' if he had been asked to name his cultural holy land; for, though the East Roman garrisons in Central Greece which had kept their heads above the flood-waters of a Slav Völkerwanderung had been christened 'the Helladhikí', neither a mouldering Athens nor a desolate Delphi and Olympia were the sites which, in the vision of a Photius or a Souídhás, were hallowed by the visibly abiding presence of the Hellenic genius.

The temenos which every Byzantine votary of Hellenism would have named as his cultural holy of holies was not an Athens that had been 'the education of Hellas'² at the Hellenic Civilization's apogee; it was a Constantinople that had become Hellenism's city of refuge in the last chapter of Hellenic history. This transference of a cultural halo from the city of Cecrops to the city of Constantine was registered in the language of every-day life in Constantinople's arrogation to herself of Athens' former privilege of being designated 'the City'³ (ἡ πόλις) *par excellence*;

¹ See the passage in chap. 50 of Constantine Porphyrogenitus's *De Imperio Administrando* that has been quoted in II. ii. 259, n. 1.

² Thucydides, Book II, chap. 41.

³ The common noun that thus became Constantinople's distinctive appellation eventually provided 'the City' with a new proper name. The Ottoman Turkish 'İstanbul' reproduces a Megarian Doric Greek *εἰς τὴν πόλιν* (pronounced 'stambólin), signifying 'to the city' in the sense of 'to Constantinople'. This would be the context in which the term would first come to the ears of non-Greek-speaking strangers who had asked the

and a patriotic Byzantine 'metropolitan' (πολίτης) in the age of the Macedonian and Comnenian dynasties could, and would, have pointed out, to any Hellenic provincial who had ventured to challenge 'the City's' claim to her title, that Constantinople's heritage from Athens was 'an enduring substance'¹ and not an empty name. From the days of Constantine the Great onwards the later Roman Emperors who had reigned at Constantinople had collected there the surviving masterpieces of Hellenic visual art; and these original monuments of the Hellenic culture, together with the Constantinopolitan collections of manuscripts reproducing the surviving masterpieces of Hellenic literature, were visible proofs that Constantinople's assumption of Athens' proud title had been no unwarrantable usurpation.

It was, indeed, true that from the year A.D. 529, in which Justinian had closed the University of Athens,² to the year A.D. 1203, in which Constantinople was captured for the first time by the Frankish perpetrators of 'the Fourth Crusade', an imperial city which, down to the latter of those two dates, had never seen an alien conqueror within her walls, had justified her claim to be called 'the City' by being the unique sanctuary of Hellenism, of which the like was not to be found in Hellas or anywhere else. This hitherto inviolate treasury stored with choice works of Hellenic literature and visual art was under Western Christian military occupation from A.D. 1204 to A.D. 1261; and there could be no more conclusive proof of the Crusaders' indifference to a Hellenistic Western Christian Civilization's cultural birthright than their almost complete failure to turn to any cultural account their fifty-seven-years-long tenancy of Hellenism's Constantinopolitan store-house. When these thirteenth-century Western French and Venetian barbarians broke into 'the City', they found it adorned with masterpieces of the classical Hellenic sculptors; and any fifteenth-century Italian pope or despot would have gone and sold all that he had³ if he had ever been offered the chance of buying a single one of these treasures; yet these Humanists' thirteenth-century forebears, who held the whole priceless collection in their grasp, could think of no better way of turning Hellenic bronzes to account than to break them up and melt the base metal down for coinage into petty cash.

A record of some of the masterpieces that fell victims to these atavistic Frankish acts of Vandalism was made, for the information of Posterity, by a contemporary Greek historian.⁴ It is astonishing that French men-at-arms should have had no eye for the beauty of these Hellenic statues in a century in which figures of comparable aesthetic merit in their own style were being carved by French sculptors. It is perhaps still more astonishing that, among the Western Christian clerics who accompanied the Frankish expeditionary force and who wielded, for good or evil, way and had been given the answer in a phrase surviving from the locally prevalent dialect of Ancient Greek.

¹ Heb. x. 34.

² See IV. iv. 272-3; V. vi. 115 and 223-4.

³ Matt. xiii. 46.

⁴ Nikítas Khoniátis' memorandum on Hellenic works of art destroyed by the Frankish conquerors of Constantinople is printed on pages 854-68 of I. Bekker's edition of Nikítas' *Khroniké* (Dillingen 1835, Weber).

a considerable moral influence over their combatant comrades,¹ not one, so far as we know, should ever have thought of employing himself at Constantinople in learning Ancient Greek in order to read in the original language those philosophical works of Aristotle's that were being studied so minutely and discussed so eagerly by these military chaplains' fellow clerks in the universities of Western Christendom during both the century preceding and the century following the establishment of a Latin imperial régime at Constantinople in A.D. 1204.

This barbarous indifference to dazzling cultural opportunities was not, of course, displayed by all contemporary Western Christian clerks. Medieval Western students of the philosophy of Aristotle did not neglect the chance offered to them in a Frank-ridden thirteenth-century Romania of verifying and revising from the original Greek text the Latin translations of Aristotle's works that they had already been making from Arabic translations in a Frank-ridden Sicily and Andalusia that had been overrun by the Crusaders more than a hundred years earlier. It is significant, however, that the translators who laboured with such devotion at Toledo and at Corinth were not native local 'fresh-water Franks' of the lineage of the *conquistadores*, but were 'salt-water Franks' born and bred in Lombardy, Germany, Britain, Brabant, and other provinces of the Crusaders' Western Christian homeland, whose enthusiasm for the study of Aristotelianism had been passionate enough to nerve them, for the sake of it, to make a long and perilous journey over the passes of the Pyrenees or across the waters of the Mediterranean. These Medieval Western culture-heroes will demand our attention in a later chapter.² In the present context we have merely to observe that the indifference to the opportunities for tapping the living waters of Hellenism at the fountain-head which was displayed by the thirteenth-century Western conquerors of Constantinople is cogent evidence that the predatory Frankish adventurers who sallied out from a conquered imperial capital to overrun outlying provinces of Romania in a Cis-isthmian European Hellas and a Peloponnesus were not drawn in that direction by the spell of classic ground, but were moved solely by the Medieval Western man-at-arms' insatiable hunger to acquire for himself a feudal lordship over some patch of rent-producing agricultural land where there was a peasantry that he could use as serfs.³

If, on this showing, we find no evidence that a yearning to set eyes on the homeland of an antecedent Hellenic culture was one of the motives in the minds of the French and Venetian conquerors of Constantinople, Central Greece, and the Morea in the thirteenth century of the Christian Era, we shall not find any grounds for imagining that a cult of Hellenism

¹ See, *passim*, Villehardouin, Geoffroi de: *Conquête de Constantinople*, ed. by Wailly, N. de (3rd ed., Paris 1882, Firmin-Didot), and Clari, Robert de: *La Conquête de Constantinople*, ed. by Lauer, P. (Paris 1924, Champion).

² On pp. 133-5, below.

³ The only product of an occupied Greece that a Medieval Frankish 'ascendancy' there can claim credit for having popularized in the Western European homeland of those Levantine *conquistadores* was—not the Greek text of Aristotle's works which was translated at Corinth by a scholar from Brabant, William of Moerbeke (see pp. 133-5, below), but a 'Malmesey' wine exported from the Laconian port of Monemvasia (Frenchified as 'Malvoisie').

played a greater part in moving the Venetians to reconquer the Morea in the ninth decade of the seventeenth century. This seventeenth-century Frankish reoccupation was, however, followed by secular pilgrimages of a new-fangled kind of which the thirteenth century had seen no trace; and the trickle of Late Modern Western connoisseurs of Hellenic art and students of Hellenic literature on pilgrimage to the homeland of Hellenism round the shores of the Aegean Sea did not cease to flow when the short interlude of Venetian rule in the Morea was abruptly terminated by an Ottoman reconquest in A.D. 1715.

This difference between the respective cultural sequels to two Frankish conquests of the Morea that were separated from one another by a Time-span of nearly five hundred years was due, of course, to the intervening captivation of the Modern Western World as a whole by a renaissance of Hellenism in the literary and aesthetic spheres which had been initiated in Italy in the fourteenth and fifteenth centuries; for a modern tendency towards the secularization of a Western way of life which had previously been lived within a Christian religious chrysalis had its effect upon the originally religious institution of Pilgrimage. Since an early stage in the growth of this institution, pilgrimage-resorts had tended to become museums of the visual arts; for, in wholly or mainly illiterate societies, it was a commonplace that pictures and sculptures were the books of an unlettered majority. In another context¹ we have quoted a passage in the *Ion* of Euripides in which a party of Athenian women pilgrims to Delphi are brought on to the stage as sightseers perambulating the precincts of the temple of Apollo. The interest that these visitors find in looking at the works of art with which the temenos is adorned lies in identifying these portrayals of mythical characters and scenes that are part of the familiar furniture of the spectators' own imaginations. This delight in the visual satisfactions that a pilgrimage-resort can provide was inherited from naïve and illiterate religious pilgrims to the holy places of Paganism and Higher Religion by sophisticated and erudite secular pilgrims to relics of the works of Hellenic art, and sites and scenes of events celebrated in surviving records of Hellenic history, when a fifteenth-century Italian renaissance of Hellenism had invested these visible and tangible 'antiquities' with an aura of pseudo-religious sanctity in the sight of a cultivated ruling minority in a Modern Western World.

This secularized Modern Western version of an ancient religious institution took the form of a 'grand tour' that, for the polite society of the Transalpine and Transmarine countries of a Modern Western World, found its earliest goal in a Roma Profana from whose long-observed virgin countenance a pious Humanism had been gingerly stripping away Roma Sacra's meretricious enamel mask. A classic example of the genre was Goethe's *Italienische Reise* (*peregrinabatar* A.D. 1786-8).

In Italy Goethe directed his attention above all to the artistic treasures. The works of art that captivated him were, however, almost exclusively confined to the relics of Antiquity and those modern works which, like

¹ In V. vi. 521-2.

Palladio's buildings, have brought Ancient forms back to life.¹ The concentration of his interest on this genre was carried by him to such extremes that at Venice he had no eye for Titian's pictures, and at Assisi none for the celebrated Franciscan Church with its picture-covered walls and ceiling.² The nearer Goethe approached to Rome, the more passionate and tempestuous became his yearning to set foot in the Capital of the World.³ After his arrival there on the 20th October [, 1786], he lived through his Roman days in a state of high beatitude. Here he found himself renewing his youth. He felt himself regenerated and endowed with a new capacity for the enjoyment of Life, the enjoyment of History, Art and Antiquity.⁴

¹ 'Palladio was penetrated (*durchdrungen*), through and through, by the essence of the Ancients, and was conscious of the pettiness and narrowness of his own age—in the spirit of a great man who is resolved not to resign himself but to re-mould the rest of Creation (*das Uebrige*) as far as possible in accordance with his own noble concepts.'—Goethe: *Italienische Reise*, ed. by Schuchardt, Chr. (Stuttgart 1862, Cotta, 2 vols.), vol. 1, p. 117.

² 'The monstrous substructures of the churches—piled one on top of another, Babylonian fashion—in which Saint Francis rests, did not detain me. I gave them a wide berth to my left, with a feeling of aversion. . . . Then I asked a handsome youngster the way to the Maria della Minerva [the *ci-devant* pagan Hellenic temple in the heart of the city]. . . . The growth in spiritual stature that I owe to the contemplation of this work of art is something ineffable. It will bear everlasting fruit. . . . [As I made my way down again,] the dear Minerva gave me one more last glimpse of her benign and consoling countenance, and then I took a side glance to my left at the melancholy cathedral of Saint Francis' (*ibid.*, pp. 159–61).

³ 'My yearning (*Begierde*) to reach Rome was so great, and was increasing by such leaps and bounds from moment to moment, that it would brook no further delay; so I made no more than a three-hours' stop in Florence. . . . I hurried through the place post-haste—the cathedral, the baptistery and all that. Here, once again, an entirely new and unknown world confronts me—and it is a world on which I have no inclination to linger (*verweilen*). The lay-out of the Boboli Gardens is exquisite. At Florence my exit was as rapid as my entry' (*ibid.*, pp. 168 and 156).

Students of Goethe's outlook and *ethos* will be reminded of a more famous passage in which the same verb *verweilen* is employed apropos of the same temptation to linger on the course of a journey—heading, in this case, not towards a physical Rome, but towards a spiritual goal of human endeavours. In agreeing the terms of his fateful wager with Mephistopheles, Faust makes the following commitment:

Werd' ich zum Augenblicke sagen:
'Verweile doch! Du bist so schön!'
Dann magst du mich in Fesseln schlagen,
Dann will ich gern zugrunde gehen!

Goethe: *Faust*, II. 1699–1702, quoted in II. i. 281.

⁴ Karl Alt in *Goethe's Werke: Auswahl* (Berlin, N.D., Bong, 4 vols.), vol. 1, pp. xxix–xxx. While the paramount objective of the Modern Western 'grand tour' was to venerate the relics, and set eyes upon the scenes, of an antecedent Hellenic culture whose legacy to an affiliated Western Civilization had at last come to be appreciated at its full value by latter-day Western Humanists, this was not, of course, the cultivated traveller's sole concern. The typical Modern French, Dutch, English, German, Scandinavian, or American visitor to Italy was, unlike Goethe, eager also to acquaint himself at first hand with the Italian monuments of an earlier phase of his own Western culture, and also to improve his own mastery of this culture in its contemporary phase by sampling other contemporary local varieties of it besides the one in which he himself had been educated owing to the accident of his having been born in the particular province of the Western World of which he happened to be a native.

The interest in the tourist's own civilization's past which was one of the attractions exercised by Italy on a Transalpine or Transmarine Modern Western secular pilgrim was a manifestation, not of the renaissance of an antecedent culture, but of a different vein of nostalgia which we have labelled 'Archaism' (see V. vi. 49–97). This Modern Western transposition of an archaic yearning from the Time-dimension into the Space-dimension by giving vent to it by way of a secular pilgrimage had had its counterpart in Hellenic history in the grand tours that had been in the fashion for cultivated Romans from the second century B.C. until the onset of the paroxysm with which an elderly Hellenic Society was afflicted in the third century of the Christian Era. After the Hellenic World had recovered from this stroke—in so far as it ever did recover from it—the secular Hesperian pilgrim to Greece, in the wake of a Titus Flamininus, a Cicero, a Nero, a Hadrian, and an Aulus Gellius, gave way to the religious Hesperian pilgrim to Palestine

Yet, fruitful though this sojourn in Rome was to prove for all the future literary labours of a *Bürger-höflich* man of genius, Goethe's comfortable journey to Rome from Karlsbad in A.D. 1786 was prosaic compared with the veritable pilgrimage to a now profanely holy city that had been made in A.D. 1755 in *formâ pauperis* by Goethe's revered¹ plebeian forerunner Johann Joachim Winckelmann, the shoemaker's son.

Meanwhile, from the close of the seventeenth century onwards, a gradually increasing band of more adventurous Western spirits had been pushing their reconnaissances of profanely holy ground beyond a Rome that had been saluted as a πόλις 'Ἑλληνίς by Heracleides Ponticus² and been vituperated as a *Graeca urbs* by Juvenal³ into a Greece that, for these classically instructed Western eyes, was Hellenism's authentic holy of holies. After a grand tour culminating at Rome had been celebrated in Goethe's *Italienische Reise*, one in which Greece was the first objective and Rome was an afterthought and anticlimax was celebrated in *Childe Harold's Pilgrimage* (in *Graeciâ peregrinabatur* A.D. 1809-11) in language that simulated the rapture of a Christian pilgrim's more spontaneous feelings at the sight of Bethlehem and Galilee.⁴

on a new course set by an Aethieria and a Jerome. In a Western World in the modern chapter of its history, a Gibbon and a Goethe and a Byron and a Leake reverted, under the auspices of a fifteenth-century Italian renaissance of Hellenism, from Aethieria's and Jerome's religious pilgrimage to Hadrian's and Gellius's cultural tour.

¹ See Goethe's appreciation of Winckelmann in *Dichtung und Wahrheit*, Book VIII (vol. iv, pp. 279-80, in Karl Alt's *Auswahl*).

² See V. v. 212.

³ See V. v. 67.

⁴ The writer of this Study had to confess that he himself had been a life-long addict to this sentiment for Hellenic ground. It had led him to make the traditional Modern Western Humanist's pilgrimage to 'classical lands' as soon as he had finished his studies at home, in *partibus Barbarorum*, at the Medieval Western Christian University of Oxford, and he had been confirmed in his devotion to this profanely sacred soil by the inexhaustible benefits that he had found himself deriving, ever after, from a ten-months' stay, first in Rome and then in Greece, in A.D. 1911-12. He could never forget his feelings on the 30th September, 1911, when, for the first time, he had made the journey from Genoa to Rome by the coastal railway. After returning, with indifference, the stare of a Leaning Tower of Pisa, which had peered in at him through his railway-carriage window looking just as it had always looked in the pictures of it, he was thrilled to find himself crossing the Arno into territory that had lain within the frontiers of the Roman Commonwealth since before the outbreak of the First Romano-Punic War. 'Henceforth', he found on the 20th May, 1950, that he had entered in his *ephemerides* for the 30th September, 1911, 'I know every stage of the way, and can always tell where we are by the look of the country. Cecina, with distant Volterra mountains to the left... O pulcherrima Maritima Tusciae—haec vera Italia, non Ligures neque Taurini.' At that moment he had the strange experience of setting eyes on his spiritual home for the first time in his life when he was in his twenty-third year; and the effect was heightened when, on the 20th November, 1911, he found his ship travelling up the Gulf of Corinth, threading its way through an isthmian canal, and breaking out into the Saronic Gulf of the Aegean Sea, to confront the pilgrim dramatically with the converging view of serried classic sites closing in round him at point-blank range: Salamis, Aegina, Methana, Megara, Cithaeron, Peiraeus, Lycabettus, Hymettus, Laurium. This was the spectacle that had overwhelmed Servius Sulpicius Rufus one day in the year 45 B.C. when he had run into it from the opposite direction (see his letter to Cicero (*Ad Familiares*, iv, 5) quoted in IV. iv. 315).

The present writer had also to confess that, in his neglect of a 'post-classical' Italy, he had gone to farther extremes than Goethe's worst extravagances. Goethe had at least set foot in Assisi, whereas the writer, down to the 13th August, 1952, had been content with a Pisgah sight of Assisi caught from Spello on the 30th October, 1911. Moreover, though he had three times been shunted into and out of Venice by train *en route* between Calais and Constantinople, he had not set foot in Venice till the third of these occasions—on the 30th April, 1923, between the hours of 5.0 and 6.0 A.M.—and had then failed to advance farther than the pair of Late Roman Emperors in porphyry who embrace one another on the threshold of St. Mark's. His third offence against his native Western

Where'er we tread, 'tis haunted, holy ground;
 No earth of thine is lost in vulgar mould,
 But one vast realm of wonder spreads around,
 And all the Muse's tales seem truly told,
 Till the sense aches with gazing to behold
 The scenes our earliest dreams have dwelt upon;
 Each hill and dale, each deepening glen and wold,
 Defies the power which crushed thy temples gone:
 Age shakes Athena's tower, but spares gray Marathon.

Yet to the remnants of the splendour past
 Shall pilgrims, pensive but unwearied, throng;
 Long shall the voyager, with th' Ionian blast,
 Hail the bright clime of battle and of song;
 Long shall thine annals and immortal tongue
 Fill with thy fame the youth of many a shore;
 Boast of the aged! Lesson of the young!
 Which sages venerate and bards adore,
 As Pallas and the Muse unveil their awful lore.¹

If, as perhaps it might have pleased Gibbon to remark, the sincerity of a cult can be measured by its capacity for breeding illusions, we may gauge the strength of a Modern Western *Schwärmerei* for the classic landscape of Greece by the vitality of a nineteenth-century Western Philhellenism. When, in A.D. 1821, the Ottoman Porte's Greek Orthodox Christian *ra'iyeh* in the Morea revolted against the Pādīshāh, Metternich's disapprobatory interpretation of the event as an inexcusable defiance of a legitimate sovereign's lawful authority² might perhaps have won the day in a reactionary-minded post-Napoleonic Western Society if the romantic lighting of a Byronic stage had not availed instantaneously to transfigure a 'now degenerate horde' into 'spitten images'³ of 'hero sires' whom they had so recently still 'shamed'.⁴ Thereafter, Byron lived to rectify one volte face by making another; and the final estimate of the character of the Modern Greek people which he was led to form by bitter experience on a grim second pilgrimage to their country was far harsher than an earlier verdict which had been the light-hearted by-product of a poet's brilliant child's play. Yet, if Byron was thus cured of his illusion about the living inhabitants of his Hellas by less than four months' intimate intercourse with them in A.D. 1824, he never lost his illusion about Hellas herself; and his devotion to this idealized ghost of a dead world, that, for good or ill, could not ever disappoint him by confronting him in the flesh, moved the Frankish poet to spend the remains of his fortune, and crown the sacrifice by laying down his life, on behalf of the unworthy living human fauna of a latter-day Western Hellenist's brazenly undiscredited profane Holy Land.

cultural past was that he had always so far deliberately refused to break any journey in Tuscany, for fear that the siren charms of a Medieval and Early Modern Italy might detain him from pressing on into Hellenic holy ground in a 'Roman Italy', a Greece, and a Turkey that had been the goal of his pilgrimages up to date.

C. THE DRAMA OF RENAISSANCES

(I) THE STAGE OF THE DRAMA OF RENAISSANCES

NOW that we have concluded our survey of renaissances, it is time to examine the stage on which the *dramatis personae* play their parts.

If an encounter of any kind is to take place, there must be some common ground on which the parties can meet. In all the encounters with which we are concerned in this Study, the parties are living souls or their wraiths, and the interaction between them is therefore always some form of action on the psychic plane, even when, as in warfare, this operates through the medium of physical collisions and combats. In 'encounters in the flesh', however, in which all the parties engaged are simultaneously alive at the time, the meeting-place in which they make their psychic contact with one another is the external physical world, whereas in renaissances the encounters are not only of a psychic order in themselves but are also experienced in a psychic meeting-place, not a physical one. A renaissance takes place in the *for intérieur* of a living actor, who provokes the encounter by waking in his own mind a memory, dormant there, of a party who is no longer alive. To recall to mind something that one has forgotten is equivalent, as has been pointed out by Socrates,¹ to learning something new; and a recollection thus precipitates an event.

The difference in the setting of the respective stages of renaissances and encounters in the flesh generates a corresponding difference in their respective ranges of action in the two dimensions of Space and Time. In the Space-dimension, 'encounters in the flesh' have the wider range; for they can occur between any parties that happen to be alive simultaneously on the face of the planet, even if these parties have been unknown to one another previously—as, for example, the indigenous societies of the New World and a Western Christian Society in the Old World were unknown to one another until they collided at and after the turn of the fifteenth and sixteenth centuries of the Christian Era as a result of the Western Christian maritime explorers' physical feat of making the transit of the Atlantic Ocean. In renaissances there is no such possibility of encounters on the geographical plane between parties previously quite unacquainted, since, in the psychic medium in which a renaissance takes place, the living party to the encounter can, as we have seen, resuscitate only those elements of the life of a dead party that happen to be already latent in the living party's memory. In the Time-dimension, on the other hand, 'encounters in the flesh' have a narrower range than renaissances; for in 'encounters in the flesh' the parties can only encounter one another at the moments in their respective lives at which they happen to meet in the Space-dimension, whereas in renaissances the living necromancer—likewise confined in the Time-dimension, though he is, to the moment of his own life at which he is

¹ See Plato: *Phaedo*, 72 E-76 C, and *Meno*, 81 A-86 C.

performing his act of magic—is at the same time able to call up, at will, out of the storehouse of his memory, elements of the dead party's life taken from all stages of this dead party's history that are on mental record there. Moreover, the evocator has it in his power to bring on to his inner mental stage simultaneously any number of events in the dead party's history that in real life were not simultaneous but were successive.

The difference in the setting of the stages of renaissances and 'encounters in the flesh' also sets different limits to the number of the characters that can take part in the play. In 'encounters in the flesh' the possible number is limited only by the capacity of the habitable surface of the planet for simultaneously providing coexisting human societies with the habitat and subsistence requisite for keeping them all alive, side by side, on minimum scales of *Lebensraum* and welfare. In renaissances the maximum possible number of dramatis personae is three, since *ex hypothesi* there can be no more than two dead civilizations whose ghosts the living necromancer will be able to conjure up out of the Sheol of his own subconscious psyche by animating some memory of them that has been lying entranced there. There cannot be an intact mental record where there is not an unbroken cultural tradition; and there can be only two dead antecedent civilizations with which a living society will have been able to maintain this necessary cultural contact across the gulf of an intervening social interregnum.

One of the two will be the civilization to which the living society is 'affiliated';¹ the other will be a contemporary of this antecedent civilization which has been implicated with it through an 'encounter in the flesh' at the time when those two now dead civilizations were simultaneously alive, and which, in the course of this encounter, has imparted to the 'apparented' civilization's internal proletariat the 'spark of life' or 'germ of creative power' inspiring a church, incubated in the bosom of this proletariat, which has eventually served the 'affiliated' society as a chrysalis.² In the history of the Western Civilization, for example, the renaissances that our foregoing survey has brought to light will be found to be revivals of some element of the life either of an antecedent Hellenic Civilization, to which the Western Civilization is 'affiliated', or else of an antecedent Syriac Civilization, contemporary with, and implicated with, the Hellenic, to which the Western Civilization is related through a germ of creative power derived from the Syriac Civilization by a Christian Church that has served the Western Civilization as its chrysalis.

Until not much more than a hundred and fifty years before A.D. 1952, renaissances and 'encounters in the flesh' were the only kinds of contact between one civilization and another of which there had been historical instances within the Time-span of some five or six thousand years during which societies of this species had been in existence up to date. But, within a period inaugurated by the French invasion of Egypt in A.D. 1798 (to give this new era a convenient, though conventional, initial date), a third kind of contact had been established through the enterprise of Late Modern and post-Modern Western archaeologists. These brilliant pioneers of historical exploration had succeeded in

¹ See I. i. 43-44.

² See I. i. 57.

making contact with civilizations that were neither living contemporaries of their own society, whom it could meet in the flesh, nor dead predecessors related to it by an unbroken tradition of the kind that linked the Western Society with a dead antecedent Hellenic Civilization to which it was 'affiliated' and also with a dead antecedent Syriac Civilization with which it was in liaison through the Christian Church.

The first of these 'lost' or 'forgotten' civilizations to be retrieved by Western ingenuity was the Egyptian; and this was hardly an accident, since the Egyptian was, for several reasons, less difficult than other castaways were to recapture. For one thing, the Egyptian culture did not have to be literally disinterred, since it had left physical monuments that not only stood above ground but towered into the sky. The Pyramids at Gîzah did not have to wait for the arrival of a French expeditionary force in A.D. 1798 to loom large in the minds of living men. Ever since their erection in the third millennium B.C. they had made an overwhelming impression on the imaginations of non-Egyptian sight-seers; and Western and Greek Orthodox Christian scholars who had never set eyes on them were familiar with the fact of their existence—and with the further fact that they were the abiding products of a now long since extinct Egyptian Civilization—thanks to the accounts of the Egyptian Society's culture and history in the records of an Hellenic Civilization which, throughout its own life-span, had been in contact in the Space-dimension with an Egyptian Tithonus.¹ One of the incidental products of this Hellenic-Egyptian encounter had been the bilingual inscription in the Greek Alphabet and in two Egyptian scripts on 'the Rosetta Stone' (*incised est* 196 B.C.) which had given Modern Western scholars their key to the deciphering of both the Hieroglyphic and the Demotic Egyptian characters; but the task of proceeding from the reading of scripts to the interpretation of a dead language conveyed in them might have been still more arduous than it actually was if in the nineteenth century of the Christian Era a language descended from the demotic Egyptian had not been still in daily use as the liturgical language of a Coptic Monophysite Christian Church.

Western scholars had more ado to recapture a Babylonian and an antecedent Sumerian Civilization whose still visible monuments were shapeless mounds of disintegrating sun-dried brick that could not compare with granite-built pyramids in impressiveness; yet here, too, living languages furnished valuable clues. The Achaemenian inscriptions in a simplified version of the cuneiform script, which provided the keys for this script's decipherment, conveyed a language of the Indo-European family from which a still living Modern Persian was descended;² the Akkadian language, conveyed in parallel columns of cuneiform script in the Achaemenian inscriptions, proved to be a member of the same Semitic family as the already familiar Arabic, Syriac, Aramaic, Hebrew, Amharic, and Ge'ez; an already acquired knowledge of Old Persian and Akkadian made it possible to decipher the Elamite language, which was the third of those employed in the Achaemenids' trilingual inscriptions,

¹ The doom of Tithonus has been observed in VI. vii. 47-52.

² See VI. vii. 247-8.

though Elamite had no affinity with any previously known language, living or dead; and bilingual texts in Asshurbanipal's library¹ enabled philologists who had already mastered a Semitic Akkadian language to interpret a Sumerian language which, like Elamite, had no known affinities, but which was of much greater historical importance than Elamite, since it proved to be the mother tongue of the creators of a Sumeric Civilization into whose heritage the speakers of Elamite and Akkadian had entered belatedly as proselytes.

Perhaps the most remarkable of all the triumphs of a Modern Western Archaeology was the disinterment of civilizations that had not only been long since dead and buried but had fallen into complete oblivion. The Minoan Civilization and the Indus Culture, both of which had been disinterred within the present writer's lifetime in the Old World, and the Mayan Civilization in the New World, were the most notable cases of dead civilizations that had suffered this total eclipse; and the recapture of the marvellously accurate but formidably complicated Mayan system of chronological reckoning and notation was perhaps the greatest feat of archaeological skill so far achieved.

The vividness of the life with which these dead, buried, and in some cases entirely forgotten civilizations were endowed in the consciousness of a latter-day Western Society that had succeeded in recapturing them was piquantly illustrated by the vitality of Ikhnaton's ghost, which, after a *vitai pausa*² of more than thirty-two centuries' duration, aroused the same controversially conflicting feelings of sympathy and antipathy in Western academic circles in the nineteenth century of the Christian Era that the Egyptiac records testified to his having aroused in the flesh in Egyptiac clerical circles when he was living, reigning, and innovating in the fourteenth century B.C.

In thus establishing a third kind of contact between one civilization and another, the Modern Western archaeologists had done contemporary Modern Western historians the invaluable service of raising the number of known civilizations to a figure at which it had become just feasible to make this species of human society a subject of comparative study.³

(II) THE OCCASION OF THE DRAMA OF RENAISSANCES

'Encounters in the flesh' may be precipitated by deliberate acts of will—inspired by aggressiveness, piety, curiosity, or other incentives—on the part of one or more of the parties. Curiosity, for example, was the motive of Herodotus's, Marco Polo's, and Ibn Battūtah's travels; piety the motive of Goethe's and Byron's, as well as Fa Hsien's and Arculf's, pilgrimages; aggressiveness the motive of Alexander's, Demetrius's, the Cid's, and Chingis' conquests. It is also possible, however, for these encounters between contemporaries in the Space-dimension to come about by accident. For example, contact between a Tari Furora Society and a

¹ See pp. 53-54, above.

² Lucretius: *De Rerum Naturā*, Book III, ll. 860 and 930.

³ See pp. 205-6, below.

Western Society that had previously had no knowledge of one another was established in A.D. 1935 when the natural fortifications of the Tari Furora's secluded fastness in Papua were penetrated by an enterprising Western explorer¹ who had not been attracted by any rumour of the existence of a mysterious people behind a barrier of knife-edged mountains, but had been impelled by a desire to fill in one of the few still remaining blanks in a Western map of the World plotted out by predecessors of Hides' who, by his day, had been at work continuously for some four and a half centuries.

The encounters negotiated by Modern Western archaeologists with dead civilizations, not related by any unbroken thread of tradition with either the Western or any other living civilization, might likewise be the outcomes of either accident or design. Schliemann, for example, made it the master-purpose of his career to identify and excavate the site of a Troy whose fame had been immortalized in the Homeric Epic,² whereas nothing but the play of Chance could have thrust into the hands of expert and imaginative investigators the clues that led to the discovery of the previously quite forgotten Minoan Civilization and Indus Culture. A renaissance, on the other hand, cannot ever come about in this accidental way; for the evocation of a ghost by a necromancer is, by definition, a deliberate act of will on the necromancer's part; and, in practising his grim and perilous art, the necromancer is always inspired by a conscious purpose.

If the wizard screws up his courage to the pitch required for subjecting himself to the self-imposed ordeal of awaking the dead, he embarks on this desperate enterprise as a last resort, under pressure of an urgent need to solve some current problem in his own life which he has failed to solve by drawing upon his native resources. The ghost of a universal state, for example, is usually evoked in the hope that its presence may quell the anarchy of a current Dark Age by the application of a remedy which, in the now dead antecedent civilization's history, did once effectively quell the anarchy of a Time of Troubles. The evocation of ghosts of the Roman Empire in the shapes of an East Roman Empire³ and a Danubian Hapsburg Monarchy,⁴ and the installation, at Cairo, of a simulacrum of an 'Abbasid Caliphate that had just been extinguished at Baghdad,⁵ were mainly inspired by the need for a united military and political front against an alien aggressor. The installation in Japan,

¹ See V. v. 197, with n. 1. The assumption, made by the writer of this Study in this earlier passage, that the Tari Furora must have acquired some elements of their material culture from abroad before the Westerners' advent is corroborated in a letter written on the spot by Mr. C. R. Stonor on the 25th January, 1950, when he was engaged in carrying out a survey of the economy of the Tari Furora people for the Government of the Territory of Papua. 'They grew maize before we discovered them—a crop which, without doubt, they obtained by occasional trading with coastal tribes, who, in turn, obtained it from Europeans.' On the other hand, Mr. Stonor writes that, apart from the acquisition of this simple American crop from some alien source, he 'can find nothing in the indigenous system of agriculture to justify the views of the late Mr. Hides, or of any popular accounts of this region, wherein it is assumed that people so low in the cultural scale could not have evolved their system of cultivation' [for themselves, independently of any of the agricultural civilizations].

³ See II. ii. 367-9; IV. iv. 323; and VI. vii. 19-21.

⁴ See II. ii. 177-88; V. v. 325-7; and VI. vii. 28.

⁵ See I. i. 67, n. 2, 70, and 349-50; and VI. vii. 21.

in A.D. 645, of a copy of the Sinic Han imperial régime, that had just been reinstated in China, was designed to foster the planting out of the Far Eastern Civilization, *de toutes pièces*, on the virgin soil of the Japanese Isles;¹ and the corresponding purpose of taming German, Scandinavian, and Slav barbarians beyond the north-eastern frontier of Western Christendom was likewise one of the motives for the evocation of the Holy Roman Empire.² The ghost of a pre-Alexandrine Hellenic city-state was revived in a Medieval Italy, and the ghost of a post-Alexandrine Hellenic absolute monarchy in the Modern Western World at large, in the hope of thereby enabling a potentially progressive Western Society to achieve its own latent possibilities on the political plane beyond the limits of the modest capacity of the clumsy native Western institution of Feudalism. The ghost of a Roman Law was evoked first in Orthodox and then in Western Christendom in the hope of providing a native economy that was rapidly increasing in complexity with a correspondingly elaborate legal framework which could not be pieced together out of a juvenile Christian society's rudimentary native law derived from Christian and Judaic sources. Aristotle's ghost in the West, and Confucius's ghost in the Far East, were evoked in the hope of enabling a Western and a Far Eastern intellect to break out of the shell of a Christian and a Mahayanian Buddhist patristic theology. The ghost of a Sinic Literature was evoked in the Far East, and a ghost of an Hellenic Literature in a Greek Orthodox and a Western Christendom, in the hope of thereby irrigating an arid native vein of literary genius. The ghosts of an Hellenic Sculpture and an Hellenic Architecture were evoked in a Modern Western World which was painfully aware that the medieval school of native Western and borrowed Syriac visual art had no more arrows left in its quiver.

A renaissance is thus always deliberately produced for a consciously conceived purpose by a living agent who is awaking the dead from their sleep; and, if the living party to the relation did not thus deliberately take the initiative, an encounter of this kind could never occur; for a ghost cannot raise itself on its own initiative, to haunt the living uninvited; nor can the dead and the living meet one another by chance, as two or more living individuals or societies can, if they happen to be alive simultaneously on the face of the same planet.

(III) THE PLOT OF THE DRAMA OF RENAISSANCES

The distinctive feature of a renaissance that determines its occasion is also the key to its plot; and our inquiry into the occasion has shown us what this distinctive feature is. In an encounter between a necromancer and a ghost the *dramatis personae* can never exchange their roles, because, in contrast to the *dramatis personae* in an encounter in the flesh between parties who are all alike alive at the time, the parties to a renaissance are not 'of like passions'³ with one another.⁴

¹ See II. ii. 158-9.

² See II. ii. 166-70.

³ Acts xiv. 15.

⁴ This difference between an encounter in the flesh between contemporaries and an encounter between a necromancer and a ghost is analogous to the difference between a

Of course, in an encounter of either, or indeed of any, kind, the initiative will have come from one side only; but, in an encounter between the living, the party which happens to have been the victim of the first assault, no less than the party by whom the first assault happens to have been delivered, has it in him to take the initiative if occasion offers. In an encounter of this kind the assaulted party's passivity and inferiority and the assailant's activity and superiority at the opening of the first act of the play are not due to intrinsic qualities in the parties' respective natures which, in virtue of being immutable, make the effects that follow from them irreversible. In 'encounters in the flesh' the assailant's ascendancy usually proves to be a wasting asset, while the assaulted party usually demonstrates his potentialities from the outset. As soon as the encounter begins, there is, as we have observed elsewhere,¹ a reciprocal exertion of influences and a concomitant tendency for the initiative to change hands through being captured from the original aggressor by the party that has been his victim at the moment when the curtain has risen on the first scene. This 'reversal of roles' (*Graecè περιπέτεια*) is, in fact, the distinctive feature of this genre of encounters; and *ex hypothesi* a corresponding exchange of parts cannot occur in encounters of the different genre in which one party only is a living individual or living generation of a society, while the other party is a wraith. We have already noticed that, in an encounter of this latter kind, the living party alone has the power to take the initiative; and we may now go on to observe that, when once, thanks to the necromancer's initiative, the ghost has been raised, the ghost alone has the power to exert an influence. The spectre's uncanny presence cannot fail to affect the haunted living soul, while the necromancer cannot retort by exercising any counter-influence on the ghost that he has raised; for the living can influence only the living, and it is impossible for the necromancer to catch alive the dead individual or society whose ghost he has called up, since, in order to catch him alive, he would have to have been his contemporary and to have encountered him in the flesh instead of in his own haunted psychic inner world. When the ghost gets on his nerves he has no means of retaliating. In an encounter of this uncanny genre the channel of influence is a 'one-way street' which admits no counter-flow of traffic; and the haunted necromancer will find cold comfort in reflecting that he has only himself to blame, and quoting *ad hominem*: 'Vous l'avez voulu!'²

An influence to which there can be no retort in kind is a challenge (indeed a formidable one); and the plot of the play which the evocation of a ghost sets in action can be summed up in the formula that the necromancer seeks to find aid for coping with one challenge at the price of exposing himself to another. He is responding to a challenge from a living contemporary by inviting a challenge from the ghost of a dead

sedentary society, in which every member is inherently capable of exchanging roles with every other, in spite of the institutional impediments of class or caste, and a Nomadic society consisting of three non-interchangeable components: the shepherds or herdsmen, the dogs, horses, and camels that are their non-human auxiliaries, and their flocks and herds (see III. iii. 7-22).

¹ In IX. viii. 464-80.

² Molière: *Georges Dandin*, Act I, scene ix.

predecessor. In every renaissance this is the structure of the plot; and the structure is necessarily rigid and invariable because the dramatis personae are incapable of exchanging their parts. Since there can be no *peripeteia* there can be no second act—and no 'concatenation',¹ either, between a series of one-act plays. In contrast to an encounter between contemporaries, which is apt to run into several acts and to link up with previous and subsequent dramas of its own genre, a renaissance is bound to be an insulated experience.

The only element of elasticity in the plot of a renaissance is the diversity of the possible denouements of a situation in which one of the parties is confronted with two challenges at once; for the doubling of the challenge raises the number of possible alternative responses to four.

One alternative, which the necromancer may bring to pass if he is sufficiently cool-headed and adroit, is for him to play off his two adversaries against one another. If he can first succeed in getting the better of the living adversary whom he is encountering in the flesh by mobilizing against him the ghost that he has evoked with that intent, he may then perhaps succeed in exorcizing the now superfluous *revenant* with the aid of the now subjugated living party. A classic example of this tricky feat of prestidigitation is the Western Civilization's success in exploiting an Italian renaissance of the Hellenic culture to retrieve a breakdown in its own native cultural growth, and then shaking off the incubus of a resuscitated Hellenism by reverting to its own distinctive Western vein.² On the other hand—and this is the second alternative—the ingenious necromancer may get the worst, and not the best, of both worlds, as a latter-day Persia found to her cost when she was constricted by the strait-waistcoat of an Imāmī Shi'ism which her Safawī conquerors had called up from Sheol to serve them as a spiritual weapon in a competition for political supremacy in an Iranic Muslim World in which the 'Osmanlis, and not the Safawīs, eventually won the day.³ As this example shows, the necromancer may both fail to solve the problem confronting him in his own social milieu which has tempted him into resorting to the necromancer's art, and may also fail to rid himself of a ghostly incubus which in this case he will have imposed on himself in vain. The third alternative is a failure to meet the challenge of a contemporary problem combined with a success in escaping the challenge of the vainly resuscitated ghost—as a nascent Western Christendom was compensated by the fiasco of the Carolingian evocation of a ghost of the Roman Empire for the failure of this abortive act of necromancy to quell the anarchy of a Dark Age.⁴ The fourth alternative—which is the inverse of the third—is exemplified in the fatal success of a Leo Syrus and a Sui Yang Chien in solving the same problem of anarchy in a nascent Orthodox Christendom and in a nascent Far Eastern World at the price of saddling the salvaged society with an incubus that defied all subsequent efforts to throw it off and that progressively increased its pressure until

¹ The phenomenon of 'concatenations' of encounters between contemporaries has been examined in IX. viii. 454-63.

² See pp. 62-73, above.

³ See I. i. 366-400.

⁴ See p. 9, above.

it eventually broke the back of the society that had deliberately assumed this fatal burden.¹

After taking this bird's-eye view of the plot of the drama of renaissances, it may be convenient to glance at the process of evocation before looking further into the nature of a challenge from the *revenant* which is the nemesis of recourse to the necromancer's art.

¹ See pp. 15 and 16, above.

D. THE PROCESS OF EVOCATION

(I) THE INVERSION OF AN ORIGINAL HISTORICAL ORDER

AT first sight it might seem possible to call up the whole culture of a dead antecedent society *en bloc*, since *ex hypothesi* the whole of this dead society's history has already been played out to a finish, and, just because it is all now dead, and is extant only in the tradition of a living society, it might be expected to be also all now revocable simultaneously. Actually, as we have found in our survey of renaissances,¹ the elements of a dead antecedent culture are apt to be resuscitated piecemeal; and there are two reasons for this. One reason, as we have seen,² is that a ghost is never raised except for the immediate practical purpose of obtaining its assistance for the solution of some pressing problem in the necromancer's own life; and the element which, with this purpose in view, he selects for reanimation out of the comprehensive spectrum of a dead civilization's accumulated experience will be only what is relevant to the current problem that is exercising the necromancer himself at the time. If, however, the necromancer were nevertheless to overstep the limit of his immediate requirements by trying to resuscitate the dead culture in its entirety, a positive obstacle to an integral renaissance would then present itself. The simultaneous presence of elements of human action and experience that have never been in existence simultaneously 'in real life' is only possible in a psychic world in which these elements have been reduced to the tenuous consistency of disembodied memories. As soon as the Will takes delivery of these ghosts from the Intellect in order to translate them into real life again, they once again become amenable to a law of real life which debars incompatible institutions, ideas, and ideals from reigning simultaneously in one and the same social milieu.

The most crack-brained Medieval Western votary of Hellenism would never, for example, have dreamed of deliberately resuscitating, side by side, a bevy of sovereign independent parochial city-states *alla Greca* and an oecumenical Roman Empire which, in the history of the Hellenic Civilization, had been the tardily applied antidote to the fatal anarchy which the licence of parochial sovereignty had eventually let loose upon the Hellenic World. When, in the twelfth century of the Christian Era, these two resuscitated Hellenic institutions did come face to face with one another in a Western arena as a result of the unco-ordinated operations of rival schools of Medieval Western necromancers, their inherent incompatibility promptly brought them into violent collision; and it proved impossible to make a Medieval Northern and Central Italy safe for a plenary indulgence in the Greek vice of parochial sovereignty without reducing 'the Holy Roman Empire' to nonentity.

For these reasons the ghosts of elements which, in the life of a dead

¹ On pp. 6-114, above.

² On pp. 118-20, above.

antecedent civilization, have come and gone in succession to one another, without ever having appeared on the stage simultaneously, are apt likewise to be resuscitated successively, and not simultaneously, in the history of an affiliated society. When this happens, the chronological order in which these ghosts are evoked is neither the original order nor a haphazard one bearing no relation to it; it is the original order in reverse.¹

In the political field, for example, a Roman Empire which had been the last political institution to be thrown up in the course of Hellenic history was the first to be resuscitated in the history of a Hellenistic Western Christendom. 'The Holy Roman Empire' was inaugurated at Rome a week before the eighth century of the Christian Era ran out, and in Charlemagne's life-time its writ ran in all provinces of the Western World of the day except Britain and Asturia. On the other hand the sovereign city-state whose emergence in Hellenic history had been almost coeval with the birth of the Hellenic Civilization itself was not resuscitated in the Western World until after the beginning of the eleventh century, and even then its first effective reappearance was confined to a Northern and Central Italian province of the Western World.² Two or three hundred years had to pass, after that, to give an expanding Medieval Western cosmos of city-states time to establish secondary strongholds in Flanders and in Germany,³ and some two hundred years more to give the resuscitated Hellenic ideal of parochial sovereignty time to translate itself from the city-state to the nation-state scale by captivating the feudal monarchies of Transalpine and Transmarine Western Europe;⁴ and it was not till after the outbreak and exacerbation of the French Revolution in Paris, little less than a thousand years after the date of the coronation of Charlemagne at Rome on Christmas Day A.D. 800, that the Hellenomane nations of a Late Modern Western World finally capitulated to the Periclean Attic political ideals of absolute sovereignty for each parochial state, *vis-à-vis* the rest of the body social, and absolute democracy for the citizens of each parochial state in the management of their own parochial domestic affairs.⁵

In this instance the reason why the original chronological order was reversed in the evolution of a renaissance is perhaps not difficult to descry. The explanation is to be found in the utilitarian considerations which are the motive of every renaissance, as we have already noticed. In Charlemagne's generation throughout Western Christendom, a nascent civilization's most urgent political need was to extricate itself from the anarchy of a Dark Age; and the obvious institutional instrument for the purpose was a universal state which had been instituted originally by a disintegrating antecedent civilization as a means of

¹ This phenomenon has been touched upon already in IX. viii. 98-101.

² 'The State in the Classical and Modern sense of the word first re-emerged in the Italian city-state with its intensive political life, its strong civic consciousness, and its complex and artificial constitutional systems' (Dawson, *Chr.: Religion and the Rise of Western Culture* (London 1950, Sheed & Ward), p. 214).

³ See III. iii. 299-300 and 344-7.

⁴ See III. iii. 360-3.

⁵ See pp. 7-15, above.

extricating itself from the anarchy of a Time of Troubles. So long as the Roman Empire had been an effective régime, a mortally wounded Hellenic body social had enjoyed a reprieve. When the Roman Empire had been stricken with its second and final paralytic stroke—which, in the western provinces, had incapacitated it at the turn of the fourth and fifth centuries of the Christian Era—the Hellenic Civilization had dissolved into the resurgent anarchy of a social interregnum with which a nascent Western Christendom was still battling in the eighth century. The Western Hellenistic Society of Charlemagne's day did not have far to seek in order to hit upon the happy thought that, if only it could now revive the Roman Empire in the form in which this had existed in the West from Augustus's reign to Theodosius the Great's (save for an interlude of recurrent anarchy between Alexander Severus's reign and Diocletian's), it might be able to recapture the blessed *pax oecumenica* which the Western Christian Society's Hellenic predecessor had enjoyed for the greater part of those four centuries.

On the other hand, Charlemagne's generation in Western Christendom, and *a fortiori* Charles the Fat's, would have found nothing attractive in the international anarchy of a pre-Alexandrine Hellenic cosmos of sovereign parochial city-states and a post-Alexandrine Hellenic cosmos of sovereign parochial 'enlightened monarchies' which were to prove so attractive in their turns to the Medieval Italians and to the Modern peoples of the Transalpine Western countries; for this international anarchy, which the Roman Empire had temporarily quelled, was the crying evil with which the Carolingians were contending. Parochial liberties bought at the price of oecumenical chaos could appeal only to communities whose energies had accumulated a head of steam strong enough to need a vent, but not yet strong enough to blow Society to pieces; and this new set of social circumstances—which differed from those of a Carolingian Western Christendom in almost every point except the significant point of being transitory—was the situation in which the pre-Augustan Hellenic ideal of parochial absolute sovereignty ran riot through the Western World in the course of some eight or nine centuries following its first revival on the city-state scale in an eleventh-century Italy.

Corresponding considerations explain the reversals of an original chronological order in the evolutions of renaissances in divers non-political fields of activity.

In the linguistic and literary field, for example, the collection of texts of works of the antecedent culture's literature, which we have found¹ to be the earliest symptom of a dawning cultural renaissance, is the latest cultural pursuit of an antecedent civilization in its death agonies. The manuscript-hunting fifteenth-century Italian Humanists were crossing pens with the manuscript-copying sixth-century monks in Cassiodorus's *vivarium* at Squillace, where the last of the great Roman imperial civil servants in the West had spent his old age in providently lading a monastic Noah's ark with samples of the Latin version of an Hellenic literature after he had retired from his thankless secular pro-

¹ On pp. 52-57, above.

fessional task of trying to make an Ostrogothic barbarian successor-state of the Roman Empire work.

The compilation of encyclopaedias and dictionaries, which is apt to follow after the collection of texts in the evolution of a renaissance,¹ comes before them in an antecedent society's cultural history; for, even when a disintegrating civilization has reached a stage of cultural decay at which it gives up the attempt at further creation in order to concentrate its dwindling energies on trying to preserve the cultural legacy of the Past, it makes, at first, an effort to bequeath the quintessence of this heritage to Posterity in a systematized form worthy of a rational mind, before eventually resigning itself to the *ultima ratio* of a mere mechanical reproduction of texts. Lexicographical activities thus occupy not the last, but the penultimate, chapter in the cultural history of a disintegrating civilization, whereas, in the evolution of a renaissance, they come, as we have observed, not first, but second, after the texts of the antecedent society's literature have been retrieved and explored. The fourth-century commentators Servius and Macrobius, the fourth-century grammarian Aelius Donatus, and the fifth-century encyclopaedist Martianus Capella, who were labouring for the preservation of the Latin version of the Hellenic literature in the western provinces of the Roman Empire on the eve of a fifth-century collapse, had to wait for their Modern Western avatars until the sixteenth century and after. In the Greek-speaking heart of the Roman Empire, where Hellenism survived for some two hundred years longer than in the western provinces, a sixth-century Hesychius of Miletus was the encyclopaedist who, in a Byzantine renaissance of Hellenism, found his avatar in a tenth-century Souïdhas;² and Hsü Shên's *Shuo Wên*, comprising 10,000 characters arranged under 540 radicals,³ which was the model for all the dictionaries compiled in a Far Eastern renaissance of Sinic letters from the T'ang Age onwards, had been produced at some date during the first half of the second century of the Christian Era, before the collapse of a Posterior Han Dynasty which was the Sinic counterpart of the Hellenic Civilization's post-Diocletianic régime.

The inversion of an original chronological order persists as a cultural renaissance continues to unfold itself. The writing of original works in the antecedent culture's literary language, which, in the antecedent civilization's own history, is apt, as we have seen, to be on the wane by the time when lexicography comes to the fore, is apt, in the evolution of a renaissance, to hang fire until the reincarnate lexicographers have prepared the ground for it.⁴ We have noticed this sequence in the history of a Byzantine renaissance of Hellenic letters,⁵ and we have also noticed⁶ that the Byzantine writers in the medium of Ancient Greek were content to imitate a Neo-Attic *κοινὴ* which had been the vehicle

¹ See pp. 57-58, above.

⁴ See pp. 59-62, above.

⁵ See pp. 60-61, above.

⁶ See pp. 60-62, above.

of the Hellenic literature of a post-Augustan Imperial Age before they had the temerity to produce caricatures of the language and style of a Thucydides and an Herodotus. In a parallel Western renaissance of Hellenism in a Latin dress, the sequence was likewise the inverse of the original order. Medieval Western Latinists were content to reproduce the Latin of a post-Diocletianic Age before they ventured to try their hand at imitating the works of an antecedent Silver Age of Latin literature, or those of a Golden Age by which the Silver Age itself had been preceded.¹

This inversion of an original chronological order can also be observed in the evolution of renaissances in the field of visual art. For example, in the evolution of a Western renaissance of Hellenic architecture, an Andrea Palladio (*vivebat* A.D. 1518-80) made his appearance 141 years later than a Filippo Brunelleschi (*vivebat* A.D. 1377-1446). In other words, a series of Western architects who were turning their eyes towards Hellenic sources of inspiration, because they were no longer finding scope for their creative powers either in a native Western Romanesque style or in an imported 'Gothic', sought to reproduce the cupola of the *Ayía Sophía*² before they thought of reproducing the columns and pediment of the Parthenon, though the Parthenon was the *chef-d'œuvre* of the native style of Hellenic architecture at its zenith, whereas the *Ayía Sophía* was a *tour de force* of Ionian epigoni of Ictinus who, after discarding their already worked-out native style as impiously as Brunelleschi and Palladio were discarding theirs, had sought their own fresh inspiration abroad in an exotic Syriac style which was the native Hellenic style's antithesis.³ In the long-drawn-out epilogue to the history of an Egyptiac Civilization which had been galvanized into an unnatural life-in-death after it had run through all the phases of disintegration to the very verge of dissolution,⁴ the artistic as well as the political style of a 'Middle Empire' which had played the senile role of an Egyptiac universal state was promptly revived, after an abortive interregnum, under 'the New Empire' in the sixteenth and fifteenth centuries B.C.,⁵ whereas the revival of the artistic style of 'the Old Kingdom', whose floruit had come and gone some seven or eight hundred years before 'the Middle Empire's', was not attempted until the advent of the Saïte Age in the seventh and sixth centuries B.C.

If, as the sequence of renaissances of Hellenic political institutions in Western history suggests, the order in which a living society evokes ghosts out of the past life of a dead predecessor is determined by the living society's estimate of the ability of divers ghosts to help it to meet its own successive pressing needs, how are we to account for the apparently well-attested fact that this utilitarian order of evocation turns out to be correlated with the order in which these elements of the life of the dead civilization had originally succeeded one another in the flesh? If the order of evocation is, as it appears to be, the inverse of the

¹ See Taylor, H. O.: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. ii, p. 152.

³ See IV. iv. 54-55.

⁴ See I. i. 133-9; II. ii. 112; V. v. 351-3; V. vi. 190; and VI. vii. 49-50.

⁵ See further pp. 350-1, below.

historical order, how are we to explain a correlation which is apparently an historical reality and yet does not appear to serve any useful purpose in itself and is certainly not deliberately intended? The explanation is perhaps to be found in the consideration that the living party to the encounter is apt to be still in process of growth during the time when it is making its successive renaissances of divers elements drawn from a dead antecedent society's past life, whereas, *ex hypothesi*, the dead society whose experiences and achievements are thus being laid under contribution one after another will have passed through all the successive stages of a disintegration into which it will have fallen as a result of having had its growth cut short by a breakdown. If we may assume that, in the living society's memory, the traditions of the archaic stage of the dead antecedent society's growth will have left no abiding impression, then, of all the phases of the dead society's history that the living society does still recollect, the last phase of its disintegration, in which it will have entered into 'a second childhood', will be the phase which will display the closest affinity with the infantile first phase of the living society's growth, whereas the adult last phase of the dead society's growth, in which it was standing at its zenith on the eve of its breakdown, will be the last phase of its history to become intelligible to its living successor, though it will be the oldest phase of the dead civilization's history that is still within the living society's ken. The living society will not begin to become capable of understanding or appreciating this adult phase of its dead predecessor's history until, in the course of its own growth, it has passed out of childhood through adolescence into a corresponding state of spiritual maturity; and, whatever may be the potential fruitfulness of some other individual's or society's recorded experience, this experience cannot become of any practical use to us unless we have learnt to understand its significance and appreciate its value.

Even a talent that we have inherited as our birthright will remain barren so long as we ourselves remain incapable of turning it to account. Just as the potential agricultural wealth of North America was inaccessible to native hunting peoples who lacked the iron axes needed for cutting down the forests,¹ or as the potential agricultural wealth of the clay soils of Britain was inaccessible to husbandmen who had not yet mastered the technique of deep ploughing,² so the spiritual experience of social maturity is inaccessible to a society that is still spiritually juvenile. And, since a treasure, so long as it remains inaccessible, is for practical purposes non-existent, it is not, after all, surprising that a living civilization which is still in its own childhood should neglect the mature achievements of a dead predecessor's manhood, and should start its course of successive renaissances by exploiting the senile products of a subsequent 'second childhood' which even a child can already comprehend and, in consequence, already utilize. The growing civilization will have to be increased in wisdom and stature³ to an altitude of approximate parity with its dead predecessor's altitude at its zenith before it can profitably bring out of its mental storehouse those choice

¹ See II. ii. 278-8.

² See VIII. viii. 38-39.

³ Luke ii. 52.

treasures that the dead society ultimately created in a period of ripeness which, in the dead society's own history, came long before the period of its senile decay.

(II) THE ECLECTICISM OF *WAHLVERWANDTSCHAFTEN*

If this explanation¹ hits the mark, our phenomenon of chronological inversion will have proved to be a variation on Goethe's theme of *Wahlverwandtschaften* ('elective affinities', 'congenialities'). In the language of the Gospels,

'Whosoever hath, to him shall be given, and he shall have more abundance; but whosoever hath not, from him shall be taken away even that he hath.'²

The hard truth proclaimed in this ruthlessly illuminating text is pointedly illustrated in the cultural history of Western Christendom.

For example, there was never a time—not even at the blackest nadir of a Western Dark Age—at which this Hellenistic Christian civilization did not 'have' the poetry of Virgil in the sense of possessing manuscripts of the text and retaining a sufficient knowledge of the Latin language to be able still to construe the literal meaning of the words. Yet there were at least eight centuries, running from the seventh to the fourteenth century of the Christian Era inclusive, during which Virgil's poetry was beyond the comprehension of even the most gifted, pious, and industrious Western Christian students of it, if we take, as our standard of what constitutes a genuine understanding, an ability to divine in Virgil's poetry the meaning that had been intended by the poet himself and that had been duly apprehended by kindred spirits in his own world, from a contemporary Horace down to a fourth-century Servius and Augustine. Even a Dante, in whose spirit the first glimmer of an Italian renaissance of Hellenism was already beginning to dawn, saw in Virgil a figure which the historical Virgil would have taken, not for his own unassumingly human self, but for some augustly mythical Orpheus or Musaeus; and, in the mental vision of less enlightened Medieval Western souls, the true lineaments of the classical poet were still further transmogrified into the quite unrecognizable shape of a wonder-working magician who had left his mark on a Neapolitan landscape where the historical poet had lived a quiet life of literary seclusion and where his mortal remains had eventually been laid to rest in a tomb on the road between Naples and Puteoli.³

Similarly, there was never a time at which the Western Civilization did not 'have' the philosophy of Aristotle in the sense of possessing the texts of the Hellenic philosopher's principal treatises on logic in competent translations by a Late Hellenic man of letters, Boëthius (*vivebat circa* A.D. 480–524), who combined a mastery of Aristotle's thought with a mastery of the Ancient Greek language in which this thought had

¹ Suggested already, by anticipation, in IX. viii. 99–100.

² Matt. xii. 12. Cp. Matt. xxv. 29; Mark iv. 25; Luke viii. 18 and xix. 26.

³ See Comparetti, D.: *Virgilio nel Medio Evo*, 2nd ed. (Florence 1896, Seeber), Parte Seconda: 'Virgilio nella Leggenda Popolare.'

originally been conveyed.¹ Yet there were six centuries, reckoning from the date of Boëthius's death, during which his translations of these works of Aristotle's were beyond the comprehension of the most acute Western Christian thinkers, notwithstanding Boëthius's foresight in leaving them keys in the shape of Latin commentaries of his own and a Latin translation of a commentary of Porphyry's.²

Moreover, there was once a time—between the date of the Crusaders' capture of Toledo in A.D. 1085 and the date of their loss of Constantinople in A.D. 1261—during which a Medieval Christendom 'had', in the sense of holding physically in its grasp, the whole philosophical, scientific, and literary legacy of Hellenism that was extant, in that age, in Dār-al-Islām in Arabic translations and at Constantinople in the Ancient Greek originals;³ yet Western Christian scholars failed to make any use of their opportunity for winning a knowledge and understanding of Hellenic poetry in the original Greek during those fifty-seven years for which the Constantinopolitan store-house of Hellenism was under Western Christian rule, whereas their fifteenth-century Humanist successors in Italy, who were debarred from the Crusaders' potentially invaluable direct access to the springs of Helicon by the successive counter-strokes of a Greek Orthodox Christian *revanche* and a consequent Ottoman Muslim conquest of an ephemerally liberated Romania, succeeded nevertheless in acquiring a mastery of the Ancient Greek language and literature as a *κτῆμα* *ἐς αἰεὶ*⁴ for a Modern Western World, thanks to their zest, energy, and acumen in profiting to the utmost from the imperfect scholarship of a dozen Byzantine Greek refugees who had found asylum in Italy from the Ottoman conquerors of their homeland and had managed to bring away with them a handful of manuscripts of Ancient Greek texts.

Considering the effectiveness of the fifteenth-century Italian Humanists' exploitation of these slender opportunities that were all that came their way, how are we to explain their thirteenth-century Venetian and French predecessors' signal failure to harvest their own immense opportunities for gathering in all the fruits of an Hellenic literary culture in Greece itself?

In seeking an explanation of this apparent paradox, we have, no doubt, to take into account the bitterness of the two sister Christian Hellenistic civilizations' animosity towards one another from the close of the twelfth century of the Christian Era to the later decades of the seventeenth.⁵ Their mutual estrangement went to farther lengths than their common quarrel with Islam, and either of these Christendoms found it easier to enter into fruitful pacific intercourse with its Muslim neighbours than with its schismatic Christian co-religionists. For this reason, a Palermo captured in A.D. 1072 and a Toledo captured in A.D. 1085 by the Western Christian Crusaders from the Muslims turned out in the sequel to be more favourable forums for cultural intercourse

⁵ See IX. viii. 151-65 and 380-92.

between the conquerors and the conquered than a Constantinople that was captured by another band of the same Western Christian aggressors in A.D. 1204. It was thus psychologically easier for Medieval Western Christian scholars to take delivery of Hellenic cultural treasures of which the Muslims happened to be 'carriers' than it was for them to incur a corresponding cultural debt to other alien 'carriers' who were schismatic Byzantine Greek Orthodox Christians; and subjugated Byzantine Greeks, on their side, may have been less ready than subjugated Muslims were to share their Hellenic cultural riches with their new Frankish masters.

In another context¹ we have noticed that, when, under the successively unfurled banners of Nestorianism, Monophysitism, and Islam, a Syriac World that was progressively liberating itself from an Hellenic ascendancy had simultaneously opened its mind to receive the Hellenic culture, it had not taken delivery of this alien culture as a whole, but had confined its interest in Hellenism to the two intellectual provinces of Philosophy and Physical Science. An Hellenic philosophy and physical science, not an integral Hellenic culture, was thus the legacy of Hellenism that Medieval Western scholars found accessible to them, through the good offices of Muslim middlemen, in the cultural forum of an eleventh-century Palermo or Toledo, and it is notorious that, in the twelfth and thirteenth centuries, a Western scholarship that had previously failed to take advantage of the legacy of an Hellenic Boëthius did show the same zest, energy, and acumen in profiting by its opportunities of mastering Hellenic philosophy and science through an Arabic medium at Palermo and Toledo as it was to show thereafter, in the fifteenth century, in acquiring the literary culture of Hellenism, in its Ancient Greek original dress, from a handful of Byzantine Greek refugees.

The speed, enterprise, and determination with which Western scholarship turned to account the opportunities offered at Toledo are particularly impressive.² One of the earliest of the series of translators who laboured there, Dominic Gondisalvi, who set to work at the instigation of the Western Catholic Christian Archbishop of Toledo, Raymond (*fungebatur circa* A.D. 1130-50), translated into Latin a running translation—made for him orally, into Castilian out of Arabic, by a bilingual Andalusian Jew, Johanan ben David ('Avendeath') of Seville—of the Muslim *savants'* commentaries on Aristotle and original works in the philosophical and scientific fields.³ The earliest maker, at Toledo, of Latin translations of the existing Arabic translations of Hellenic philosophical and scientific works was a Gerard of Cremona (*obit* A.D. 1187); and this Lombard translator at Toledo was followed by a Michael Scot (who is believed to have learnt his Arabic at Palermo), by a German Hermann, and by an English Alfred (*florebat* A.D. 1215-70).⁴

If this were the whole story, we might imagine that we had now fully explained the contrast between the imperviousness of Medieval Western Christian minds to the classical works of Hellenic literature which lay at their disposal in the original Greek at Constantinople and other points in Greek Orthodox Christendom, that were conquered by Western Christian arms in and after A.D. 1204, and the eagerness with which the same Medieval Western Christian minds seized upon and mastered the philosophical and scientific works of Aristotle which were accessible to them, in Arabic translations, at Palermo and Toledo. We might jump to the conclusion that this contrast was simply the corollary of a difference in degree of intimacy and cordiality between the respective relations in which the Medieval Western Christians stood to their Arab Muslim and to their Greek Orthodox Christian contemporaries. We might not suspect that a Medieval Western mind's selection of the works of Aristotle, and rejection of the works of Plato, the Attic dramatists, Pindar, and the authors of the Homeric Epic in the twelfth and thirteenth centuries of the Christian Era had anything to do with any differences in degree of psychological affinity between the respective relations in which a Medieval Western culture stood to divers successive phases of the Hellenic culture itself, as these were represented by the various works of an Hellenic intellect and imagination that have just been mentioned. There would, however, be two palpable flaws in any answer to our question which ignored the play of *Wahlverwandschaften* in the contact in the Time-dimension between an affiliated Western Christian Hellenistic Civilization and its Hellenic predecessor, in order to offer an explanation solely in terms of the contacts in the Space-dimension between a Medieval Western Christendom and its Muslim and Greek Orthodox Christian contemporaries that were the dead Hellenic culture's two living 'carriers'.

Any answer that was confined within these limits would have failed to take account of two intractable historical facts. One of these facts is that in the fifteenth century, when Italian Humanists were eagerly acquiring from refugee Byzantine Greek 'carriers' their knowledge of the Ancient Greek language and literature, the religious and cultural animosity between Western and Orthodox Christians was even more violent than it had been in the thirteenth century,¹ when Medieval Western Christian scholars were showing themselves insensible to the attractions of Ancient Greek poetry. The other relevant fact is that in the thirteenth century the Western Christian enthusiasts for the study of Aristotle's philosophy, who were making such good use of the opportunities offered at Toledo for studying it through an Arabic medium, did not, as a matter of fact, neglect the simultaneous opportunities offered at Constantinople and elsewhere in the Frankish principalities on Greek Orthodox Christian soil for gaining access to texts of Aristotle's works in the Hellenic philosopher's own original Ancient Greek. Though the Frankish conquerors of Romania, including the clerks as well as the fighting-men, would appear to have been barbarously indifferent to the Hellenic cultural treasures of all kinds—philosophical as well as poetic and plastic—that they held in their insensitive hands,² the contemporary Frankish

¹ See IX. viii. 151-2.

² See p. 110, above.

Aristotelians in the Crusaders' West European homeland did make serious efforts to supplement their Palermitan and Toledan translations of Aristotle's works into Latin from Arabic with better translations into Latin from the original Greek which the Frankish conquest of Romania in and after A.D. 1204 made it possible thereafter to produce.¹

"The Schoolmen, no longer satisfied with renderings from the Arabic versions of Aristotle, began to obtain translations taken directly from the Greek. Thus the *De Anima* was known to William of Auvergne (who became a bishop of Paris in A.D. 1228 and was still alive in A.D. 1248) in a translation from the Greek, before the Schools of Paris had received Michael Scot's translation either of the Arabic text or [of] the commentary by Averroës. The *Rhetoric*, the *Politics*, the first four books of the *Nicomachean Ethics*, the *Magna Moralia*, part at least of the *Metaphysics*, and the *Parva Naturalia*, were known from the first in Latin translations from the original.² . . . It may . . . be inferred³ that a Latin translation of the Greek text of the *Ethics* was known under the name of [Robert] Grosseteste [*vivebat circa* A.D. 1175-1253], having probably been executed under his direction between A.D. 1240 and A.D. 1244 by one of the Greeks whom he had invited to England.⁴ . . . Thomas Aquinas . . . in quoting Aristotle . . . uses translations from the Greek alone, and not from the Arabic.⁵ It was at his own instance that "William of Brabant" is said to have produced in A.D. 1273 (doubtless with the help of others) a literal Latin translation of the Greek text of "all the works of Aristotle", which superseded the old renderings from the Arabic.⁶ "William of Brabant", [who] is none other than William of Moerbeke or Meerbecke, . . . was probably one of the young Dominicans annually sent to Greece to learn the language. After his return (*circa* A.D. 1268) he was chaplain to Clement IV and Gregory X, and acted as Greek secretary at the Council of Lyons [A.D. 1274].⁷ . . . Towards the close of his life he became [Latin Catholic] Archbishop of Corinth (A.D. 1277-1281) and continued the work of executing (and possibly superintending) translations from Greek into Latin."⁸

¹ See Sandys, op. cit., pp. 547-64.

² Ibid., p. 548.

³ From the two facts (i) that Hermann, the Toledan translator from the Arabic, 'who finished his translation of the Arabic commentary of Averroës on the *Ethics* in A.D. 1240, states, in the preface to his rendering of Al-Farābī's comments on the *Rhetoric* in A.D. 1256, that his work on the *Ethics* had been rendered useless by Grosseteste's translations of the latter from the original Greek' (Sandys, op. cit., pp. 554-5, citing Hermann's: 'Reverendus pater, magister Robertus, Lincolnensis episcopus, ex primo fonte, unde emanaverat, Graeco videlicet, ipsum librum est completius interpretatus et, Graecorum commentis praecipuas annexens [*sic apud Sandysium*—A.J.T.] notulas, commentatus.'). and (ii) that Grosseteste's 'great admirer, Roger Bacon, . . . assures us that . . . [Grosseteste] could never translate from either Greek or Hebrew without assistance' (Sandys, op. cit., p. 553)).

⁴ Ibid., p. 555.

⁵ Jourdain, op. cit., p. 40.

⁶ "[*Sub anno* A.D.] 1273: Wilhelmus de Brabantia, Ordinis Praedicatorum, transtulit omnes libros Aristotelis de Graeco in Latinum, verbum ex verbo, quā translatione scholares adhuc hodiernā die utuntur in scholis, ad instantiam domini Thomae de Aquino" (Slav. Chron. in Lindenbrog's *Scriptores Rerum Germ. Septent.*, 1706, p. 206; cp. Jourdain, p. 675).⁷

According to Taylor, H. O.: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. ii, p. 391, a series of Latin translations of Aristotle's works made from the Greek text, direct, was produced by collaborators of Saint Thomas Aquinas from A.D. 1263 onwards.—A.J.T.

⁷ See the present Study, IV. iv. 532, 569, 616, and 622.—A.J.T.

⁸ Sandys, op. cit., pp. 562-3. A list of works of Hippocrates and Galen and of Simplicius, Ammonius, and Proclus, besides Aristotle himself, that were either certainly or probably translated by William of Moerbeke into Latin out of the original Greek, will be found *ibid.*, p. 563.

This historical evidence makes it clear that the mutual antagonism of the two Christian Hellenistic societies did not, in fact, prevent thirteenth-century Western Christian scholars from acquiring from their Orthodox Christian contemporaries any elements in Orthodox Christendom's cultural heritage from Hellenism on which any thirteenth-century Western Christian hearts were set.

'In the course of about 130 years, i.e. in the interval between the early translations at Toledo in A.D. 1150 and the death of William of Moerbeke in A.D. 1281, the knowledge of Aristotle's philosophy had passed in [Western Christian] Europe from a phase of almost total darkness to one of nearly perfect light;'¹

and, in this thorough, as well as rapid, Medieval Western Christian intellectual conquest of Aristotelianism which culminated in William of Moerbeke's labours at Corinth, the pacific *conquistadores* were not deterred by any psychological inhibitions from drawing upon a Byzantine Greek as well as an Andalusian Arab storehouse of Hellenic culture. How came it, then, that, when they were so eagerly pulling out the original Greek texts of Aristotle's works from thirteenth-century Byzantine shelves, they were content to leave untouched the works of Ancient Greek poetry, stacked there side by side with the *Corpus Aristotelicum*, which were to be pulled out in their turn some two hundred years later by fifteenth-century Italian Humanists with an eagerness as lively as the thirteenth-century Western Schoolmen's passion for the philosophy of Aristotle?

Considering that, in the interval, the already bad relations between the Franks and their living Greek contemporaries the Byzantines were steadily deteriorating, we can only account for the subsequent awakening of Western imaginations to an appreciation of the beauty of a dead Ancient Greek poetry on the supposition that, in the course of those intervening two centuries, some cultural *épanouissement* in Frankish souls in Northern and Central Italy had been attuning them to Ancient Greek melodies to which the thirteenth-century Frankish Aristotelomaniacs had remained deaf when their ears had been opened to the clicking Morse Code of an Aristotelian logic that had been equally inaudible to them till then; and, as soon as we find ourselves having to allow for this unknown quantity, we can identify it, with some assurance, with a familiar historical event. In Italy between Dante Alighieri's day (*vivebat* A.D. 1265-1321) and Poggio Bracciolini's (*vivebat* A.D. 1380-1459), a growing school of Humanists had been successfully 'tuning in' to the melodies of a dead Hellenic poetry in the Latin rendering into which the original Greek cadences had been transposed by Virgil and the lesser denizens of a Latin Muse's transported Parnassus. We can watch this cultural process of recapturing an appreciation of Hellenic poetry in a Latin dress in the act of accomplishment in the fourteenth-century Italian soul of Petrarch (*vivebat* A.D. 1304-74). By the fifteenth century the process was complete; and this long and arduous apprenticeship in a Latin medium had elicited, in the souls of the fifteenth-century Italian

¹ Sandys, *op. cit.*, p. 565.

Humanists who had served it, the aesthetic capacity to appreciate Hellenic poetry in the Greek original.

The door of a Medieval Western mental prison-house was thus by that time unlocked and ajar; and one touch from the fumbling hand of a dimly enlightened Byzantine Greek refugee therefore now sufficed to push this door wide open. The ease with which the fifteenth-century Italian Humanists in a Latin medium made themselves Humanists in the original Greek vindicates the truth of the aphorism 'Whosoever hath, to him shall be given, and he shall have more abundance'.¹ The Italians' successful cultivation of their native Latin legacy from Hellenism in the course of the Later Middle Ages of Western history had assimilated the mental atmosphere of the precocious fifteenth-century Italian province of an embryonic Modern Western World to the cultural climate which a by then long since dead Hellenic World had once enjoyed in the times in which the Greek and Latin masterpieces of an Hellenic literature had been created.

This episode of Medieval Western cultural history points to the explanation of a phenomenon which has come to our notice as a matter of historical fact. If, in the history of a living civilization, the divers phases of a dead antecedent culture are apt to be conjured up in a sequence which is the inverse of the order in which these same phases have originally appeared in the antecedent society's own life, the reason, as we can now discern, is because a ghost does not become amenable to a necromancer's incantations unless and until the would-be wizard has learnt the art of invoking the departed spirit in the dead soul's own familiar language. The necromancer will never be able to raise a ghost with which he is not already psychologically in sympathy; for, even if the shades in Sheol were willing to answer to the summons of a discordant living voice, it would be impossible for a necromancer to have addressed a summons to a shade with which he had not already acquired some psychic affinity. Without this bond of pre-established harmony to place him *en rapport*, the necromancer would be disablingly insensitive to the aura of the ghostly presence.

A truth which, in this Study, we have approached empirically, through a survey of historical embodiments of it, has been apprehended by Plato intuitively and been presented by him in a myth. Plato's account, in the *Critias*, of an imaginary civilization of the first generation flowering on the subsequently lost continent of Atlantis, out in the Ocean somewhere to the west of the Straits of Gibraltar, is prefaced by a passage purporting to explain why it is that no more than the most jejune tradition of this dead civilization's character and achievements has been preserved by its successors through an intervening series of social interregna caused by recurrent cataclysms.

'While the names of [the great men of this dead Atlantic Civilization] have been preserved, the memory of their achievements has been obliterated by the catastrophes that have overtaken their successors and by the immensity of the periods of the time that has since elapsed. We

¹ Matt. xiii. 12, quoted on p. 130, above.

have already observed¹ that the survivors of the periodic catastrophes have always been a remnant consisting only of illiterate highlanders whose knowledge of the past rulers of their world has been virtually confined to a bare list of names. These famous names have still had a strong enough hold on their affections to move them to bestow them on their own children, but they have had no knowledge of their predecessors' qualities and institutions beyond the faintest echoes of hearsay. The reason is that, from father to son for many generations running, they have suffered from a shortage of the sheer necessities of life, and that their attention—and consequently their intellectual activity—has been concentrated on these shortages to the neglect of Ancient History. Mythology and historical research are a pair of activities that only gains a footing in communities in process of civilization (*πόλεις*) *pari passu* with a margin of leisure. Their opportunity arrives when a community has reached a stage at which the necessities of life have been provided for; until that stage is reached, there is no opening for them; and this is the reason why only the names of the famous men of Antiquity have been preserved, without any accompanying memory of their achievements.²

In other words, there can be no renaissance of a dead culture except in the bosom of an affiliated society that has raised itself to the cultural level at which its predecessor was standing at the time when it was accomplishing these achievements that have now become candidates for resuscitation; and (Plato reminds us), even if the affiliated society does eventually attain this degree of cultural maturity, the possibility of a renaissance is not thereby automatically guaranteed; for, in the meantime, the tradition of the antecedent culture in the affiliated society's heritage from its predecessor may have worn so thin that a tardily established cultural affinity may find itself neutralized by the lack of even the most ethereal medium for establishing communications between the living society in the current phase of its history and the corresponding phase of the history of the dead civilization.

¹ In the *Timaeus*, 21E-23C, quoted in this Study in IV. iv. 24-25.

² Plato: *Critias*, 109D-110A.

E. THE CONSEQUENCES OF NECROMANCY

(I) THE TRANSFUSION OF PSYCHIC ENERGY

WHAT rites are required for establishing effective contact with a ghost with whom a necromancer has business to transact?

According to a legend in the *Odyssey*, the technique of raising the dead was found to be a dangerous game by the hero of the epic when, some twenty-seven centuries before Columbus's day, he cast off from the land of the living and made the untried westward transit of Ocean Stream in quest, not of gold and spices in the workaday markets of a terrestrial Cathay, but of oracles from a phantom seer's uncanny lips in a mouldering House of Hades.¹ Though Odysseus showed his usual prudence by following, to the letter, the professional instructions of the sorceress Circe,² even so he had considerable difficulty in extricating himself from his hazardous psychic adventure; and Odysseus' experience, as narrated in the epic in the adventurer's *oratio recta*, is doubly disconcerting to the reader; for the hero of the *Odyssey* was granted a privilege which we cannot hope to share if we venture in his wake in real life.

The crux of necromancy lies in the hard fact that a psychically depotentiated ghost cannot hold converse with the living unless its vitality has been momentarily raised again to the level of consciousness;³ the sole means of administering this indispensable temporary reinvigoration to the shades of the departed is to give them a restorative draught, and for this purpose such insipid ingredients as honey, milk, wine, water, and barley meal⁴ are not enough; in order to bring a ghost back to an effective state of animation, the vivifying brew has to be 'laced' with the sinister infusion of some living creature's freshly shed blood. This is a prescription *sine qua non* without which no business can be transacted; 'no blood-offering, no oracle';⁵ and Odysseus duly provided the life-taking life-giving draught; but the legendary Achaean hero was allowed to reanimate the shades of Teiresias and the rest of the ghastly rout by a vicarious sacrifice. The operative blood that Odysseus infused into the innocent but ineffective bloodless offerings in his sacrificial trench spurted from the sword-slashed throats of a young ram and a black ewe,⁶ whereas the blood that has to be contributed in real life is not an amenable substitute's but is the necromancer's own—with which he parts at a risk, for himself, of succumbing to pernicious anaemia.

Thus, in real life, the necromancer can restore a ghost's vitality only at the cost of lowering his own by the exact degree to which he raises his phantom beneficiary's; and the venturesome necromancer's plight becomes more and more precarious as the difference in psychic potency between the souls of the two parties to this ghoulish encounter is progressively reduced by the living party's deliberately performed self-

⁶ *Od.* X, ll. 527-8; *Od.* XI, ll. 35-36.

devitalizing ritual act. At the beginning of the proceedings, when the spectre's potency registers zero, while the necromancer's registers a still undiminished plenitude of normal human blood-pressure, the difference is of a magnitude at which it constitutes a securely impassable gulf;¹ but, as the original difference approaches parity, this gulf dwindles to the narrowness of a strait across which the reanimated ghost can leap; and at that stage the necromancer has both attained the result for which he has been working and has incurred the peril which, in his profession, is inseparable from success. The reanimated ghost is now at the successful necromancer's disposal for him to command if he can; but, in consequence, the necromancer himself is now exposed to a risk of having the tables turned on him by the reanimated ghost.

The truth seems to be that a ghost which is impotent to take the initiative in engineering its own revival does not feel any moral obligation towards a necromancer whose motive in taking the necessary initiative and in making the indispensable blood-sacrifice has not, after all, been a disinterested one. The first use that the ghost will make of the vitality that the blood-transfusion is restoring to him will be to reassert a will of his own. In the language of a nascent post-Modern Western Science of Psychology,

'An autonomous complex pursues its way and goes through its paces, repeating its own special performance quite regardless of any human consideration. It is a kind of ghost haunting the corridors of the Mind, and, like a ghost, it enters the sphere of the Present from the still living Past. It is elusive and hard to challenge, like the ghost. Only analytical insight, with fair appraisal of its historical significance, can break through the intangible envelope and release the energy informing it.'²

In real life a necromancer seldom has the legendary Odysseus' luck of drawing as his 'opposite number' in the lottery a Teiresias who honours a gentleman's agreement by delivering his oracle in exchange for the draught of revivifying blood and then tactfully relieving the necromancer of his presence.³ And, even when the shade with which the necromancer has business to transact does behave in this gentlemanly way, his unwanted fellow phantoms neutralize his tact by their importunity. When Odysseus was engaged in raising the ghost of Teiresias, the dark life-blood had no sooner spurted into the sacrificial trench than

'they came flocking up from Erebus, the souls of the lifeless dead: brides and their grooms; old men with a tale of sufferings to match their tale of years; and maidens in the springtide of their sorrow, which was as fresh as the bloom of their youth. There came warriors, too, slain in battle, with their armour bedabbled in gore. All these in their multitudes came crowding round the trench from every quarter, with an unearthly clamour; and I, at their onset, was gripped by a blanching fear.'⁴

¹ Luke xvi. 26.

² Baynes, H. G.: *Mythology of the Soul* (London 1940, Baillière, Tindall & Cox; 1949, Methuen), p. 862.

³ *Od.* XI, ll. 150-1.

⁴ *Od.* XI, ll. 36-43. Lines 38-43 were rejected as spurious by the Alexandrian critics Zenodotus and Aristophanes on the unconvincing ground of an alleged inconsistency with what follows them.

Odysseus, being Odysseus, did not lose his nerve, disconcerted though he was. As Circe had counselled him, he drew his sword and, squatting behind his trench with the weapon outstretched over it at arm's length, he 'fended off the feeble forms of the dead from approaching the blood' until he had done his business with Teiresias.¹ In thus inflexibly carrying out his instructions, this man of many sufferings and superhuman powers² performed a prodigy of strongmindedness; for, in the uneasy interval before the gentlemanly seer Teiresias presented himself, the first ghost to importune him was his unburied comrade Elpenor's,³ while the second was his mother Anticleia's.⁴ After Teiresias' ghost had duly appeared and delivered his oracle and withdrawn, Odysseus let down his guard over the blood-offering and gave access to other ghosts in a queue, with his own mother inevitably at the head of it;⁵ but in the end he found it advisable to beat a hasty retreat for fear that the hazardous situation might get out of hand.

'After saying his say, Hêraklès went back to the House of Hades, while I stood my ground by the trench in case I might be approached by yet another of the hero warriors who had met their deaths aforetime. And, as like as not, I might have gone on seeing warriors of olden times according to my choice; but, before I could sate my curiosity, there came flocking upon me countless hordes of the dead with an unearthly din, and I, at their onset, was gripped by a blanching fear lest queenly Persephone might send upon me from Hades the Gorgon's head—fell monster's countenance.'⁶

Odysseus thereupon acted with a characteristic promptness which saved him from the fate that Pandora had brought upon Mankind when she had let loose all the scourges of human life by lifting the lid of her jar.⁷ Odysseus made off in a trice, got his crew and himself back on board, and baffled his spectral assailants, as a living German army was to be baffled one day at Dunkirk, by putting the insulating breadth of Ocean Stream between the pursuers and the pursued.⁸ This happy ending is not, however, a guaranteed outcome of the necromancer's adventure. A legendary Odysseus has his historical fellow adventurers who have not escaped so lightly.

(II) THE CHALLENGE FROM THE *REVENANT* AND A PAIR OF ALTERNATIVE POSSIBLE RESPONSES

(a) THE ANTAEBAN REBOUND AND THE ATLANTIAN STANCE

When Odysseus had the temerity to trespass on the threshold of the Underworld, he duly won his sought-for oracle from the reanimated ghost of Teiresias, but, in winning it, also put himself in jeopardy of being made to pay for his impertinence by being confronted with the Gorgon's head. What was this *visio malefica* that Odysseus thus both

¹ *Od.* XI, ll. 48–50 and 82.

³ *Od.* XI, ll. 51–83.

⁴ *Od.* XI, ll. 84–89.

⁵ *Od.* XI, ll. 152–625.

⁶ *Od.* XI, ll. 626–35.

⁷ Hesiod: *Works and Days*, ll. 42–105, especially ll. 90–104.

⁸ *Od.* XI, ll. 636–40.

courted and dreaded? It was the nemesis to which every necromancer exposes himself whenever he scores a success in playing his dangerous professional game. Thanks to his successful interrogation of Teiresias' obliging shade, Odysseus secured invaluable information in advance¹ about his own stormy future; it was invaluable because this uncanny foreknowledge just enabled the hero to master his fate by winning his way home to Ithaca and there recovering possession of his lost wife, property, house, and kingdom. Odysseus thus 'got away with' what he wanted in playing his game with the Infernal Powers; but other players, of hardly less note, have proved either less adroit or else perhaps merely more unfortunate.

Jacob, for example, in his nocturnal encounter at Peniel,² where he 'was left alone and there wrestled a man with him until the breaking of the day', won a blessing from this formidable jinn that was no less precious than a gracious Teiresias' oracle; but a legendary Canaanite Jacob brought tribulation on himself for lack of a legendary Hellenic Odysseus' saving sense of measure. Jacob did not know when he had had enough; and his insufferably obstinate terms to his foiled supernatural adversary—'I will not let thee go except thou bless me'—cost him the dislocation of a major joint which left him lame for life. Jacob's retrospective boast—'I have seen God face to face and my life is preserved'—though it may perhaps have been no exaggeration of the truth, was at the same time admittedly no cure for the boaster's permanent disablement. His fateful adversary had left an abiding mark on Jacob for evil as well as for good.

A legendary Canaanite Pygmalion, who fell in love with a statue that was the work of his own art, was extricated by the gods from the predicament into which this princely artificer had brought himself through an idolization of his own technique³ by their gracious act of breathing the breath of life into the nostrils of an ivory ikôn which, thanks to this auspicious supernatural intervention, miraculously became a living soul.⁴ As for a legendary post-Christian Western Frankenstein, who had no claim upon God's grace, this eponymous hero of a latter-day society came to an awful end which both a Pygmalion and a Jacob had escaped. Frankenstein's monster, like Jacob's jinn, did eventually take his departure; but in this Modern Western version of a Syriac myth the roles were reversed; for in this latter-day encounter it was the necromancer, and not the ghost, that took the initiative in breaking off the engagement, and the inhuman creature of a human creator's science made off with a curse instead of a blessing on his lips. 'I go, but remember: I shall be with you on your wedding night.'⁵ While Jacob got off from his wrestling match with the Powers of Darkness none the worse for it beyond being lamed for life, Frankenstein's penalty was the loss of his birthright of creativity.

Is it possible to define more closely this terrifying challenge from the *revenant* which is the price of invoking the *revenant's* aid in seeking a response to some pressing challenge in the realm of current life? Such

¹ Detailed in *Od.* XI, ll. 92-137.

² See IV. iv. 423-65.

³ Shelley, Mary: *Frankenstein, or the Modern Prometheus*, chap. 20.

⁴ Gen. xxxii. 24-32.

⁵ Gen. ii. 7.

a definition is perhaps implicit in the words in which Frankenstein was addressed by the monster whom he had conjured into life: 'You are my creator, but I am your master;—obey!'¹ It looks as if the relation between the necromancer and the ghost that he has raised can never be one of psychic parity. One or other of the two parties must be master, and one or other slave; and the shade of the departed has no sooner been reanimated by the sorcerer's *tour de force* than the live man and the *revenant* find themselves plunged—and this inevitably and immediately—into a contest which is deadly because a vital issue is at stake.

What is going to be the gruesome blood-transfusion's ultimate effect? Is the necromancer going to gain more by giving the reanimated ghost the strength to work for him, supposing that the ghost proves amenable, than he is going to lose by proportionately diminishing his own strength and thereby affording the ghost an opening for establishing an ascendancy over the living man who has recalled the dead to life, supposing that the ghost chooses thus to take advantage of his resuscitator's self-inflicted weakness? Is the rash communicant with the dread powers of an Underworld to return inspired by a muse or possessed by a devil? Is his encounter with the dead to be a stimulus or an obsession? Manifestly either of these alternatives is a possible outcome, since it is already manifest that the challenge from a *revenant* is a particular form of a general phenomenon, discernible in encounters of all kinds, that has come to our attention in more than one previous context. A personality's response to the psychic impact of another personality may be the kindling of a creative 'light caught from a leaping flame',² or it may be a submission to the deadening 'social drill' which we have labelled 'mimesis'.³ A military uniform that may stiffen a soldier's plastic human nature into the superhuman inflexibility of a hero under fire may also stiffen it into the sub-human lifelessness of an automaton on the parade-ground; and the same pair of alternative possible outcomes presents itself when the challenger happens to be a *revenant* from the Underworld of a Dead Past as when he happens to be a living contemporary.

In the language of a nascent post-Modern Western science of Psychology,

'The atavistic attraction of a primordial image can become so overpowering at certain crises that only a disciplined devotion to reality, a devotion that cannot be uprooted or deflected, is able to withstand it. . . . The alternative possibility contained in the symbol can be apprehended by the term "psychological creation". . . . The ambivalence of the anima-figure now appears as an alternative to which Consciousness is able to respond in two ways. To . . . become identified with the archaic image would be one way. To express the Unconscious creatively, but to maintain psychological responsibility towards the expression, would be the other. Both ways are possible; the choice is fundamentally a question of attitude.'⁴

These two alternative possible attitudes have been given classical expressions in an Hellenic mythology.

⁴ Baynes, H. G.: *Mythology of the Soul* (London 1940, Baillière, Tindall & Cox; 1949, Methuen), pp. 701-2.

When Hêraklê's was making his westward trek along the length of North Africa to find the Garden of the Hesperides and bring back thence the guardian nymphs' life-giving apples, he ran across two giants, Antaeus and Atlas. Before Hêraklê's advent, Antaeus had proved an invincible adversary for all comers who had ever been so rash as to join battle with him; for this sanguine giant was a son of Mother Earth; and, if ever, in any wrestling-match, his antagonist contrived to throw him, the momentary victor was merely defeating himself; for, in thus causing Antaeus to renew his contact with his mother, he was giving him the opportunity to replenish his vitality from its original source, and the giant refreshed invariably scored a decisive victory on the rebound from his momentary prostration. When Hêraklê's accepted Antaeus's challenge and was baffled, in his turn, by this Earth-child's buoyant recoveries, he found a solution for the Antaeian problem by strangling the wretch to death while holding him aloft off the ground. In sharp contrast to the series of triumphs that Antaeus had won before Hêraklê's advent, the experience with which Atlas had met had been the discouraging one of defeat. This giant Atlas was the child, not of the goddess Earth, but of the titan Iapetos;¹ he had taken part, together with the rest of Iapetos's brood, in the Titans' unsuccessful assault on the Olympian citadel of the usurper high god Zeus; and, when the battle was over, the malicious leader of a victorious war-band of interloping barbarian gods had exercised his ingenuity in devising retaliatory torments for his defeated adversaries. Whatever we may think of the dooms of Menoetius and Prometheus, we must admit that, in the sentence passed on Atlas, Zeus did 'make the punishment fit the crime'.²

'The baleful mind of Atlas plumbs the depths of all the seas, but the giant's own frame holds up the tall pillars that keep Earth and Heaven asunder.'³

'Atlas, compelled by an overmastering constraint, holds up wide Heaven, supporting it with his head and his unwearying hands in his station at the ends of the Earth, just on the hither side of the shrill Hesperides; for this was the doom that was dealt out to him by the wit of Zeus.'⁴

Atlas's crime had been an attempt to scale high Heaven; the punishment inflicted on him was to hold high Heaven up; and this was the stance in which the melancholy giant was eventually found by his visitor Hêraklê's. In order to grasp the relation between an Atlantean stance and an Antaeian rebound, we have to recognize that the Earth, off whose fostering breast a buoyant Antaeus was perpetually bouncing up like an india-rubber ball, and the Firmament whose dead weight was constantly pressing down upon the head and hands of an immobilized Atlas, are merely two different aspects of one and the same psychic continent as seen from opposite quarters of the spiritual compass. This depressing Firmament and refreshing Earth are, in psychic reality, identical. 'The choice' between falling into an Atlantean stance and making an Antaeian rebound is in truth 'fundamentally a question of attitude'.

² Gilbert, W. S., in *The Mikado*.

³ *Od.*, Book I, ll. 52-54.

⁴ Hesiod: *Theogony*, ll. 517-20.

The antithesis between the Antaeian and the Atlantean attitude has been traced out in a Platonic dialogue, staged in a post-Marxian Russian social setting, which is no less illuminating if it is myth than if it happens to be history.¹

'In the summer of A.D. 1920 the two philosophers, M. Gershenson and V. Ivanov, were living in the Convalescent Home for Scientific and Literary Workers in Moscow. Each of them was installed in a corner of the common room. From one corner to the other they exchanged twelve letters about problems of the Philosophy of History. . . .

'The standpoint represented by Gershenson was one of an anarchic hostility to Culture.

' "All the spiritual achievements of Mankind, [he wrote] all the wealth of intuitions, factual knowledge and moral standards that has been garnered and fortified in the course of the centuries—all this has latterly become burdensome to me. It weighs on me like some throttling yoke, like some dress that is excessively heavy and excessively warm.² This feeling has been distressing me for a long time past; but it used to descend on me only occasionally, and even then never for long at a time, while now it has become a chronic experience. As I see it, it would really be the greatest possible blessing if one could plunge into Lethe and, in those waters, flush out of one's soul, without leaving a trace, the recollection of all religions and systems of philosophy, all factual knowledge, all arts and all poetry, in order to step out on to the [farther] bank as naked as Primaeval Man, and there—naked, unencumbered, and joyful—stretch out one's bare arms, in freedom, till they touched Heaven. There would be only one thought out of the Past that one would wish to retain in one's consciousness, and that is: How burdensome, how oppressively hot, it was in those [now discarded] clothes! How blissfully unencumbered one feels without them!"'

We may pause at this point in our quotation to observe in parenthesis that both the depression and the yearning which Gershenson has here

¹ The dialogue, as reproduced here, is a translation from the German text of Ernst Robert Curtius's *Deutsche Geist in Gefahr* (Stuttgart and Berlin 1932, Deutsche Verlags-Anstalt), pp. 116–19. Professor Curtius records that he had extracted it from the journal *Die Kreatur*, Jahrgang I, Heft 2 (1926). The passages here translated have been quoted with the permission of the author and the publishers.

² This inhibiting effect of the incubus of the Past has been noticed by Hume in his essay *Of the Rise and Progress of the Arts and Sciences*. In Hume's opinion, however, the impositions of a dead antecedent civilization are not so paralysing as those of some living community in one's own world which has forged ahead of its neighbours and consequently made an impact on them comparable to that of an alien culture.

'Perhaps it may not be for the advantage of any nation to have the arts imported from their neighbours in too great perfection. This extinguishes emulation and sinks the ardour of the generous youth. So many models of Italian painting brought into England, instead of exciting our artists, is the cause of their small progress in that noble art. The same, perhaps, was the case of Rome when it received the arts from Greece. That multitude of polite productions in the French language, dispersed all over Germany and the North, hinder these nations from cultivating their own language, and keep them still dependent on their neighbours for those elegant entertainments.

'It is true, the Ancients had left us models, in every kind of writing, which are highly worthy of admiration. But, besides that they were written in languages known only to the learned—besides this, I say, the comparison is not so perfect or entire between modern wits and those who lived in so remote an age. Had Waller been born in Rome during the reign of Tiberius, his first productions had been despised when compared to the finished odes of Horace. But in this island the superiority of the Roman poet diminished nothing from the fame of the English. We esteemed ourselves sufficiently happy that our climate and language could produce but a faint copy of so excellent an original.'

depicted in the light of his own experience are sensations that Atlas is experiencing while he is performing his interminable fatigue-duty of holding up the Firmament.

The melancholy giant's state of depression can be taken for granted; his longing for release is attested by the alacrity with which he accepted Hêraklê's offer when the wayfaring demigod proposed to give Atlas a holiday by temporarily taking the giant's burden on his own shoulders, on the understanding that Atlas would employ his ticket of leave on the mission of collecting for his temporary liberator a basketful of life-giving apples from the neighbouring Garden of the Hesperides. Atlas duly performed this part of the bargain; but, when he came back, apples in hand, and, standing, for once, at ease, saw his intolerable load resting on other stalwart shoulders, he was seized by a sudden overwhelming temptation to play on his obliging visitor the mean trick of leaving him eternally *planté là* in a stance in which it was impossible for the living pillar to get out from under his incubus unless some voluntary substitute should first step in under to relieve him. According to the Hellenic myth, Hêraklê—stimulated to an unwonted intellectual activity by an emergency in which brawn could not serve instead of brain—hit upon a ruse for tricking the dishonest Titan into reassuming his pristine burden and thereby enabling his temporary *remplaçant* to slip out again after all.

We can now see, however, from a chance disclosure in Gershenson's account of the Atlantean state of mind, that Atlas would inevitably have retrapped himself, even if Hêraklê had not had his uncharacteristic 'brain-wave'. For Gershenson's one idea of how to use an imaginarily recaptured liberty is to reach up and touch the very Firmament from whose pressure he imagines himself released; and the Atlantean touch has a magic effect which is the opposite of the Antaeus. When Antaeus touches a motherly Earth, he rebounds from her bosom; but, when Atlas touches a step-fatherly Heaven, he clamps the load down upon his head. Atlas' predicament looks rather like a hopeless case. At infinity, Atlas' interminable stance seems bound to lose him his life, either by freezing him into the state of petrification that is a living creature's penalty for having beheld the Gorgon's head,¹ or alternatively by goading him into Samson's suicidal act of pulling down the roof in order to die with the Philistines.² But we must not anticipate the sequel to the story in our post-Marxian Russian version of it.

Ivanov's answer to Gershenson contains the following significant passages:

"I will tell you what is the real origin of the mood to which you are so painfully subject at the moment. It is a reflection of a particular attitude towards Culture—an attitude in which Culture is experienced, not as a live treasure-house of gifts, but as a system of exquisitely subtle constraints. That is not surprising; for, after all, the goal that Human Culture has pursued has been precisely to make itself into a strait-waistcoat. As I see it, though, Culture is something very different: it is a guide of Erôs and a hierarchy of veneration."

¹ This is the common fate of 'arrested civilizations' (see III. iii. 1-111), 'fossils' (see I. i. 35 and 90-92), and 'Tithoni' (see VI. vii. 47-52).

² Judges xvi. 30.

'Gershenson, however, insists upon Primitivism like the true blue Rousseauite that he is:

"I would give up [he writes] all the factual knowledge and all the ideas that I have gleaned from books, and would sacrifice, into the bargain, the whole of my own intellectual superstructure that I have succeeded in erecting on those academic foundations, in exchange for the joy of personally achieving, entirely out of my own experience, one single original act of knowledge. It might be as simple as you please, but it would have the freshness of a summer's morn."

"The discussion is then carried to a deeper level by Ivanov's passing beyond the limits of a merely cultural ideal and introducing the transcendence of the Absolute.

"A man who has faith in God [he writes] will not consent at any price to see in his faith merely one of the constituents of Culture. On the other hand, a man who has become a slave of Culture will inevitably diagnose Faith as a cultural phenomenon, whatever may be the exact definition of Faith that he goes on to work out. He may define it as an inherited outlook and an historically determined psychic *habitus*, or define it in terms of Metaphysics and Poetry, or define it, again, as a socially formative force and an ethical standard: it all comes to the same thing. . . . The real point is this: our faith in an Absolute—in which we are already in touch with something that is not Culture—is the issue on which our destiny hangs. If we have this faith it gives us an inward freedom which is veritably Life itself; if we do not have it, our unbelief condemns us to an inward enslavement by a Culture that has long since become godless in principle through the effect that it has had of imprisoning Man in himself (as has been definitively expounded by Kant). Faith alone—and, by 'faith', I mean a complete renunciation of the Fall of Man, for which 'Culture' is another name—will enable you to overcome that 'temptation' of yours which you have felt so deeply. But Original Sin cannot be eradicated by a superficial obliteration of its outward marks and manifestations. To un-learn our literacy and to 'expel the Muses' (to speak with Plato's words) would be merely a palliative; the letters of the Alphabet would reflect, all over again, the old unalterable spiritual constitution of the prisoner fettered to the rock in the Platonic Cave.² Rousseau's dream is the offspring of unbelief. On the other hand, living in God means living no longer entirely in the realm of Relativity which is the realm of Human Culture; it means rising above Culture into Freedom in one part of one's own being."

"The two friends did not succeed in arriving at an understanding with one another; but Ivanov's way of working out the idea implicit in Humanism is a clarification that is of such truly decisive significance for ourselves that I will take the liberty of quoting one last utterance of his.

"Culture itself, in the true sense of the word, is, as I see it, no dead level, no plain bestrewn with ruins, no field sown with dead men's bones. Culture has in it, moreover, something veritably hallowed; for Culture is a recollection, not only of our forefathers' terrestrial form and outward appearance, but also of their spiritual achievements in dedicating Mankind to ideals. It is a live, everlasting recollection which, in souls that become participants in these dedications, is undying. These dedications have been bequeathed by our forefathers for the benefit of their remotest

¹ See the passages of works of Plato's that have been discussed in the present Study, IV. iv. 585-8.—A.J.T.

² Plato: *Respublica*, 514A-521C, quoted in this Study in III. iii. 249-52.—A.J.T.

descendants; and no jot of the once new letters shall pass away;¹ for the Spirit of Mankind on which they are stamped is one and indivisible. In this sense, Culture is not just something monumental; over and above that, it is a spiritual initiative; for the faculty of recollection, which is Culture's sovereign ruler, permits the true servants of Culture to become participants in our forefathers' 'initiations' and communicates to these faithful servants, in the act of renewing these initiations in their souls, the power to make new beginnings and new departures.

"Recollection is a dynamic principle, in contrast to an oblivion that signifies lassitude, cessation of movement, decline, and regression to a condition of relative torpidity. We share Nietzsche's determination to keep a sharp watch on ourselves, to make sure that we do not harbour in our souls the poison of disintegration, infection, and 'decadence'. What is 'decadence'? It is a sense of an exquisitely subtle organic bond with the monumental tradition of a dead civilisation (*hohen Kultur*), combined with an oppressively proud consciousness of being, ourselves, the last epigoni in the series. In other words, a recollection that no longer has any life in it because it has lost its spirit of initiative, and therefore does not any longer give us any power of participating in the initiations of our forefathers or any impulse towards taking the initiative effectively, is tantamount to an awareness that 'the oracles are dumb'²—which is, as a matter of fact, the title given by a decadent Plutarch to one of his works (*De Defectu Oraculorum*)".

In this last-quoted passage, Ivanov is diagnosing the nature of 'the Antaeon rebound' in terms of Socrates' doctrine of ἀνάμνησις³ and Jung's concept of Primordial Images. 'If the Soul is to achieve this recovery of self-possession (*diese Selbstbesinnung*), it has, as we can learn from Ivanov, to comply with one indispensable condition: it must go back into the very innermost depths;⁴ and then, when it has risen again from this pearl-fishing diver's descent into Hell, it has to resist an Atlantean temptation 'to become identified with the archaic image'⁵ that it has retrieved from the Abyss, in order 'to express the Unconscious creatively'⁶ in a masterful act of metabolization that is 'the alternative possibility'.⁷ A living soul that does thus succeed in accomplishing an Antaeon rebound from the renaissance of a dead antecedent culture acquires thereby 'the power to make new beginnings and new departures' because its creative way of handling what it has resuscitated generates the *élan* that is the gait of growth⁸—in contrast to the mechanicalness of the mimesis⁹ that is the inadequate Atlantean response to an identical challenge from the same *revenant*.

If to 'have life and have it more abundantly',¹⁰ in the spiritual and not merely in the physical sense of the word, is the true end of Man, the possibility, opened up by a renaissance, of making an Antaeon rebound is an opportunity that is not too dearly bought at the price of incurring the inevitable risk of stiffening, instead, into an Atlantean stance. We can also now perhaps see why it was that, in Modern Western minds, the renaissance of a dead antecedent culture, which in reality is no more

¹⁰ John x. 10.

than a neutral event in the issue between Life and Death, should have so incongruously acquired a connotation that associated it with a spring-like outburst of fresh vitality. In the history of a fifteenth-century Italian renaissance of the Hellenic culture, which had been canonized as 'the Renaissance' *sans phrase* in a subsequent Modern Western tradition,¹ the repetitive rebirth of something that had been born before was followed, *resiliente Antaeo*, by the unprecedented new birth of something that was now being born for the first time. These two events were so far from being identical that the second of them had to fight for its life—in a strenuous 'Battle of the Books'²—in order to make good its debatable birthright. In the sequel to this fifteenth-century renaissance in the Western World there were unmistakably Atlantean tendencies warring against those that were manifestly Antaeian; but, by dint of ignoring these Atlantean symptoms, having no eye for any except the Antaeian, and identifying these with the foregoing renaissance³ of Hellenism that had provided the occasion of this mighty Antaeian rebound in Modern Western history, Western minds had contrived to invest 'the Renaissance', and therefore the generic term 'renaissance' as well, with an aura of vitality and creativity strangely out of keeping with a Cimmerian fog that is the genuine atmosphere of the Odyssean and all other 'necyia'.

(b) A SURVEY OF ANTEAEAN AND ATLANTAEAN REACTIONS⁴

If we now take a survey of responses to the challenge presented by renaissances, we shall find the examples of Atlantean stances preponderating over those of Antaeian rebounds in the ubiquity of their distribution among the divers provinces of social life, if not in the sheer weight of their numbers. Whereas the unequivocal examples of the Antaeian rebound seem to be confined to the two fields of Religion and Literature, we find the Atlantean stance not only likewise strongly represented in both these fields, but also presenting itself in the fields of Politics, the Visual Arts, and Pilgrimages, in which no examples of the Antaeian rebound are forthcoming. In surveying the Soul's reactions to renaissances, we shall also find, as we have already found in surveying its reactions to encounters between contemporaries, that there are instances—and these perhaps not the least interesting and important of those on our muster-roll—which cannot be classified exclusively under either of two antithetical heads, but have to be pronounced ambivalent. In the array of reactions to renaissances, cases of ambivalency present themselves in the fields of Religion, Politics, the Visual Arts, Philosophy, and Law; and in Philosophy and Law they seem to have the field to themselves.

The supreme example of an Antaeian rebound is the sequel, in the soul

¹ See pp. 1-5, above.

² See pp. 68-69, above.

³ In thus identifying a birth of something new with a new birth of something old, the Modern Western literary purveyors of the French word *renaissance* were doing what had been done with the Greek word *palingenesis* in a post-Alexandrine chapter of Hellenic history (see V. v. 27, n. 2, and V. vi. 172-3). They were taking liberties with the literal meaning—a new birth of something old—which had been the original usage of the word, in order to invest it with a new significance that was hardly legitimate.

⁴ In order to avoid an unnecessary multiplication of footnotes, the writer has refrained, in this chapter, from giving references to the survey of renaissances in X. B (ii), above.

of Saint Francis of Assisi, to his evocation of the spirit of Christ. An *imitatio Christi* which would have been intolerably presumptuous if it had not been unselfconsciously humble was proved to have been no mechanical act of mimesis by the light of the leaping flame that seared the saint's body with the stigmata of its lightning-like passage as it kindled Christ's spirit in his soul. In the histories of the civilizations of the third generation it would be hard to descry any other soul that had won such grace from so hazardously high a spiritual venture; but, when we pass from this unique evocation of Christ's own spirit to evocations of the spirit of His Apostles, we find more than one example of the Antaeian rebound from this still lofty yet not quite Everestian spiritual altitude. This creative reaction is exemplified in the souls of those other Western saints who set themselves to lead an apostolic life, both outside the fold of the Western Christian Church of the day, as heretics, and inside it, as friars of the Orders of Saint Francis and Saint Dominic, in the twelfth and thirteenth centuries of the Christian Era;¹ and it is exemplified again in the souls of a John Wesley and his companions and successors, who in the eighteenth and nineteenth centuries were moved with the same compassion² for shepherdless sheep scattered abroad in urban wildernesses.

An Antaeian rebound was likewise the sequel to the evocation of a ghost of Jewish Aniconism in the Protestant fraction of a fissured Modern Western Christian Church; for this resuscitated tabu on the representation of the Godhead in visual form was a reminder of the greatness of the spiritual gulf across which the encounter between God and Man takes place; and, the keener the human soul's sense of the distance between these two spiritual poles, the higher the tension of the current that streams between them in a vaulting arc.

Iconoclasm, however, is not enough in itself to ensure an Antaeian rebound—as is attested by its Atlantean outcome in the history of a sister Christian Church. Though the Iconoclastic Movement in Orthodox Christendom petered out, as we have seen, in a compromise in which the Iconodules had the best of the bargain, it did not fail to fulfil its first imperial patron Leo Syrus's purpose of disciplining the Orthodox Christian Church into becoming an obedient humble servant of an East Roman *imperium redivivum*.³ Nor was this bitted and bridled Church afterwards any more happily inspired when it evoked the ghost of a Jewry in diaspora⁴ in order to keep itself still in existence after its subjugation by an East Roman Imperial Government had resulted in the breakdown and disintegration of the Orthodox Christian Civilization and the imposition of peace on the main body of Orthodox Christendom by an alien universal state in the shape of the Ottoman Empire. In eventually consenting to serve in an Ottoman régime as a *millet*, as in previously consenting to serve in an East Roman régime as a department of state, the Orthodox Church was accepting the sentence passed on Atlas by Zeus in the Hellenic myth.

¹ See IV. iv. 369-71, 558-60, 562, and 652-6.

² Matt. ix. 36 and xiv. 14; Mark vi. 34.

³ See IV. iv. 346-53 and 592-623.

⁴ This diasporan organization of Jewry has been noticed in IX. viii. 272-313.

Moreover, a Western Protestantism that had reacted with an Antaeon rebound to an evocation of a Jewish tabu on graven images, from which an Orthodox Christendom had recoiled into an Atlantean stance, did not escape Atlas' fate when it evoked another ghost of Judaism in the shape of Sabbatarianism; and a similar fate overtook a latter-day Islamic Society when it evoked, out of the past of Islam, a pristine puritanism in and after the eighteenth century of the Christian Era¹ and a pristine Shi'ism at the turn of the fifteenth and sixteenth centuries.² These successive revivals of two movements in the history of Primitive Islam, which had been at daggers drawn in their original epiphanies, both had the uniform effect of drawing down upon a latter-day Islamic Society's devoted head the incubus of a pair of spiritual maladies—militancy and formalism—which had always been Islam's besetting sins, and which had never failed to seize any opportunity of fastening upon her again whenever she had succeeded for a season in rising above them and momentarily shaking them off.

It is impossible to guess which type of reaction might have been precipitated by the evocation, first in Orthodox and then in Western Christendom, of the ghost of an 'Adoptionism' that appears to have preceded the 'Conceptionist' presentation of Christianity and to have survived in an Antitauran fastness in order to re-emerge from there, in the ninth century of the Christian Era, in the shape of Paulicianism. A ninth-century Paulician movement in Eastern Anatolia, and a Bogomilism and a Catharism whose subsequent invasions of Europe were a murdered Paulicianism's posthumous revenge, were each in turn repressed by physical force³ at too early a stage for it to be possible for us to know them by their fruits.⁴ There are other reactions to the evocation of a ghost from the Past in the field of Religion which compel us to classify them, not as unidentifiable, but as ambivalent, by displaying unmistakably Antaeon and unmistakably Atlantean symptoms side by side.

In a modern chapter of Western history, for example, we have seen a renaissance of an Augustinian predestinarianism, which had persistently reasserted itself in the successive forms of a Protestant Calvinism, a Tridentine Roman Catholic Jansenism, and a post-Christian and anti-Christian Marxism, first generating Antaeon outbursts of energy and enterprise and then freezing the Western body social into an Atlantean posture⁵ in which this colossus's feet of clay were sundered by an unbridgeable gulf of 'unplumb'd, salt, estranging sea'⁶ insulating race from race, whether these were the spiritual races of the Elect and the Damned,

¹ See IX. viii. 250 and 602.

² See I. i. 366-400.

³ See IV. iv. 364-9 and 624-34. The 'manifest destiny' of Paulicianism had been to take the place, in Orthodox Christendom, of a 'Conceptionist' Christianity which, in both its Iconoclast and its Iconodule vein, had failed to save the Church from becoming the servant of a resuscitated Hellenic universal state. The 'manifest destiny' of Catharism had been to take the place, in Western Christendom, of a Catholic Christianity which had been failing to serve as a good shepherd for sheep astray in the strange social milieu that had been conjured up in Western Christendom by a resuscitation of the Hellenic political institution of the idolized city-state.

⁴ Matt. vii. 16-20 and xii. 33; Luke vi. 43-44.

⁵ See V. v. 426-7 and 615-18.

⁶ Arnold, Matthew: *Isolation*, quoted in II. i. 326.

or the social races of the Proletariat and the Bourgeoisie, or the physical races of the Albinos and the Negroes.¹

A Modern Western Protestant Christian bibliolatry had had a no less ambivalent effect. In evoking this ghost from the Sheol of Christianity's Judaic past, Protestantism had released hidden waters of life in a galaxy of new fountains that had irrigated not only the Protestant countries in which they had welled up, but the whole of the Modern Western World. The translation of the Bible into the vernacular languages of the Protestant Western peoples had conferred on all Western vernacular languages alike, in Catholic as well as Protestant eyes,² a prestige that had previously been the monopoly of a dead Latin and Greek; the literary cultivation of a people's mother-tongue had prepared the ground for universal education; the microscopic study of a sacred text had been an apprenticeship in a higher criticism which could be, and duly was, applied thereafter in all fields of scholarship. These reactions to a Judaic idolization of the Bible had been Antaeian indeed; yet the Atlantean responses to the same challenge had been no less portentous. The political nemesis of hallowing the local vernaculars of a society which was a linguistic Babel had been the grim epiphany of a Gorgon's head in the guise of a Linguistic Nationalism.³ The moral and intellectual nemesis of deifying holy scriptures was a Protestant servitude, from which a still priest-ridden Tridentine Catholicism had remained free, to 'the letter that killeth'.⁴ The Protestant deification of the Bible in the sixteenth century of the Christian Era had had the same deadening effect on spiritual life as the Muslim deification of the Qur'ān in the ninth century, and as the Sikh Granth-worshippers' caricature of this Muslim lapse into the mortal sin of polytheism (*shirk*).⁵

When we pass from Religion to Language and Literature, we find both a fifteenth-century Italian revival of Classical Latin and Ancient Greek in a Western World, and the perennial survival of Sanskrit in a Hindu World, uniformly giving rise to an Antaeian outburst of literary creativity in living vernacular languages. As a Sanskrit Rāmāyana inspired a Hindi *Rām-charit Mānas*, so the Ancient Greek and Latin classics in divers literary genres inspired corresponding works in Tuscan, Castilian, and Portuguese, in Northern French and Midland English, in High German and Low Dutch. So far from checking the progress of a Western polyglot vernacular literature which, since its birth in the eleventh century, had blossomed in French, Provençal, and Tuscan in turn, the fifteenth-century Italian renaissance of Latin and Greek gave an impetus to the vernacular literary movement that carried it from Italy and France into all the other linguistic provinces of an Early Modern Western World. The new mastery of Ciceronian Latin which was achieved by an Erasmus did not lure his fellow Westerners into abandoning the literary cultivation of their own mother tongues in order

¹ See II. i. 207-49.

² For example, the literary form of a High German language that had been created by Luther in his act of translating the Bible had been adopted by German-speaking Catholics as well as by German-speaking Protestants.

³ See IV. iv. 185-90 and IX. viii. 536-8.

⁴ 2 Cor. iii. 6.

⁵ See I. i. 9, n. 3.

to revert to a reanimated dead language which had been shown, by the great Humanist's performance, to be a superb medium for conveying all the thoughts and feelings that Erasmus's contemporaries in the Western World might be moved to express in prose; it inspired them with the ambition to develop their divers living vernaculars into adequately massive vehicles for carrying a Ciceronian load, and, *a fortiori*, to refine them into adequately subtle instruments for catching, from a Horace or a Virgil, strains that could find a convincing echo only in some language that was still alive on the lips of a latter-day Western poet. An Erasmian Latin prose found its *métier*, and kept it for some two hundred years, as the *lingua franca* of an early Modern Western Republic of Letters; but, when, towards the end of the seventeenth century of the Christian Era, the Humanists' cult of Hellenism suffered its decisive defeat in the controversy between the respective champions of 'the Ancients' and 'the Moderns', even this limited function of serving as an oecumenical linguistic medium for Western philosophy, science, and scholarship was captured from Erasmus's Latin by Bossuet's French. The transition may be caught in the act in the table of contents of the collected works of Leibnitz (*vivebat* A.D. 1646-1716).

These incidents in a Modern Western reaction to a Late Medieval Italian renaissance of Latin and Greek were Antaeian indeed; but they were also Antaeian with a vengeance. A living French vernacular which, in the *grand siècle* of Modern French history, came to be elevated above its peers to an invidious eminence, in order to play a discarded Latin's oecumenical role, had neither the literary prestige nor the political neutrality that had made Latin so apt an instrument for this indispensable Western cultural purpose. The failure of French fully to fill the formidable linguistic vacuum produced by the abandonment of Latin was the first symptom, in this cultural encounter between the Modern West and a ghost of Hellenism, of the stiffening of an Antaeian rebound into an Atlantean stance; and this tragic *peripeteia* declared itself unmistakably when, in a Late Modern chapter of Western history, the local vernacular languages of the Western World began to prostitute to the political service of a parochial nationalism the literary gifts that had accrued to them in double measure from the Humanists' cult of the Hellenic classics and from the Protestants' cult of the Bible.¹

This Atlantean aspect of the sequel to a fifteenth-century renaissance of Hellenism in the Western World was, however, relatively incon-

¹ Down to A.D. 1952 it looked as if the Hindu World might succeed in avoiding a corresponding aberration. There seemed to be little sign of any tendency for a polyglot Hindu Society's sense of oecumenical solidarity to disrupt itself into parochial national movements animated by the perverse ideal of manufacturing so many political fatherlands out of the areas in which the divers living vernacular languages of the Hindu World happened respectively to be current. If it were indeed true that the Hindus had not reacted in this unfortunate Western way to the literary cultivation of local living vernaculars under the stimulus of a classical language and literature derived from an antecedent civilization, the Hindus' happier record in this respect was perhaps the consequence of external pressure rather than the fruit of innate virtue. Whereas the Modern Western World had been virtually free from external pressure from A.D. 1683, when the 'Osmanlis had met with their second, and decisive, reverse before the walls of Vienna, down to A.D. 1917, when the Bolsheviks had entered into the heritage of a Petrine Russian Empire, the Hindu World had been under Muslim pressure since the tenth century of the Christian Era, and under Western pressure since the eighteenth.

spicuous by comparison with the portentousness of the Atlantean reaction to a ninth-century renaissance of Hellenism in a Greek Orthodox Christendom; for here, as we have seen, the recultivation of the Ancient Greek classics stifled, instead of stimulating, the growth of a literature in a living Modern Greek language. The few stunted shoots that had succeeded in forcing their way up in competition with the choking thorns¹ of a resurgent Hellenism would hardly have survived if the field had not been drastically ploughed up again by aggressive Western trespassers. A Modern Greek vernacular literature held its own—as far as it did hold its own—against Byzantinism at the price of following a Western lead; and, in the latest chapter of the history of this Graeco-Occidental cultural intercourse, the archaizing Romanticism in which the indigenous vernacular literatures of a Late Modern Western World had proclaimed their self-enslavement to the service of a parochial Nationalism was caricatured in a new-born Kingdom of Greece by the perpetration of the *καθαρεύουσα*. A Modern Greek people that had just liberated itself from an Ottoman political ascendancy promptly used its newly won powers of self-determination to put its Modern Greek mother tongue in Ancient Greek irons.

If this Atlantean reaction to a renaissance of Hellenism in Greek Orthodox Christendom carried to extremes an Atlantean tendency that is likewise discernible in the Western response to a challenge from the same *revenant*, the whole-heartedly Antaeian rebound of the living vernacular languages of the Hindu World from their contact with a maternal Sanskrit is offset by the hyper-Byzantine stance of the Chinese main body of a Far Eastern World under the petrifying Gorgon stare of the resuscitated Sinic classics. It will be seen that the field of Language and Literature, like the field of Religion, was a debatable ground on which an Antaeian-minded Ivanov and an Atlantean-minded Gershenson had fought inconclusive battles.

When we turn to Politics and the Visual Arts, we here find the Atlantean reaction holding the field, save for one or two cases of ambivalence.

The classic political examples of the Atlantean stance are the avatars of an antecedent civilization's universal state in the shapes of the Sui and T'ang Empire in the Chinese main body of a Far Eastern World, the East Roman Empire in a Greek Orthodox Christendom, and the Cairene Caliphate in an Arabic Muslim World; and, if the Danubian Hapsburg Monarchy, the Carolingian and Timurid empires, and the caricature of a Chinese T'ang régime in the Far Eastern Civilization's Japanese offshoot failed to play the same disastrously momentous part in the histories of the Western Christian, Iranic Muslim, and Japanese societies, this was merely because the Danubian Monarchy never succeeded in making itself more than nominally oecumenical,² while the

¹ Matt. xiii. 7; Luke viii. 7.

² See V. v. 325-7. The Danubian Hapsburg Monarchy had been called into existence after the collapse of the Kingdom of Hungary in A.D. 1526 to serve as a carapace for protecting the south-eastern land-frontier of the Western World against Ottoman aggression (see II. ii. 177-88); a union of the remnant of Hungary with the lands of the Bohemian Crown and with the hereditary dominions of the House of Hapsburg proved

other three evocations all happened to prove expensively abortive.¹ In contrast to the social effect of a universal state in its original epiphany in the flesh, when it secures a postponement, though not a permanent remission, of the execution of a self-imposed sentence for a society that has already inflicted mortal wounds on itself, the social effect of the evocation of a dead and buried universal state's ghost is to force the growth of the evoking society to a hot-house pace at which it is condemning itself in advance to pay for a spell of artificially induced precocity by a premature breakdown in which Atlas involuntarily betrays and stultifies his mission by doing Samson's suicidally vindictive deed.

In the history of Western Christendom up to the date of writing mid-way through the twentieth century of the Christian Era, the same penalty had been paid already three times over for the sin of resuscitating the pre-Augustan Hellenic political institution of the deified parochial state; and in this parochial three-act play of Western political

to be a sufficient mobilization of Western strength to prevent the 'Osmanlis from making further continental conquests at Western expense; and the rest of the Western World therefore left it to the Danubian Hapsburg Monarchy to perform this public service for the Western common weal, without acknowledging its obligation to the Monarchy by submitting to the hegemony of a *Caesarea Maestas* whose suzerainty, even within the limits of the Holy Roman Empire, had never been more than nominal, outside the frontiers of the hereditary dominions of the imperial house of the day, since 'the Great Interregnum' (*vacabat* A.D. 1254-73).

The role of unprofitable servants, who had done that which it was their duty to do, without having earned thereby any claim to recognition or reward (Luke xvii. 7-10), was naturally resented by the Hapsburgs of the Danubian line when it was imposed upon them by their Western beneficiaries, and they expressed this resentment by making their weight felt in the interior of the Western World whenever any slackening of the pressure from their Ottoman adversaries gave them an opportunity to neglect their task of serving as wardens of the West's anti-Ottoman marches. Such opportunities for occasional intervention in the domestic politics of the Western World were expended by the Danubian Hapsburg Power, with remarkable consistency, on Atlantean efforts to uphold lost causes. The ninety-years-long eclipse of the Ottoman Power from the death of Sultan Süleymân I in A.D. 1566 to the appointment of Mehmed Köprülü to be Grand Vezir in A.D. 1656—an eclipse that was only momentarily relieved by the meteoric career of Sultan Murâd IV (*imperabat* A.D. 1623-40)—was spent by a Viennese *Caesarea Maestas* in Counter-Reformational activities culminating in the Thirty Years' War (*gerebatur* A.D. 1618-48). The temporary exhaustion of the Ottoman Power after the Great War of A.D. 1682-99 was taken by the Danubian Hapsburg Power as an opportunity for joining forces with the Netherlands and Great Britain in order to repress King Louis XIV of France for the benefit of British interests. The relief from Ottoman pressure after the collapse of the Ottoman Power in the Russo-Turkish War of A.D. 1768-74 tempted the Danubian Hapsburg Monarchy into committing itself to the forlorn hope of repressing the hydra-headed 'Ideas of Seventeen Eighty-Nine', which had no sooner been crushed in their first avatar in the form of a Napoleonic imperialism than they reasserted themselves in the form of a nineteenth-century Romantic Nationalism which the Danubian Hapsburg Monarchy was so far from being able to repress that it was first encircled and finally disrupted by it.

It is true that these Atlantean reactions to the raising of a ghost of a Roman *Caesarea Maestas* at Vienna were not entirely unaccompanied by Atean symptoms. The most lively of these was the role which Vienna came to play as a melting-pot for transforming Orthodox Christians or ex-Orthodox Christian Uniates into Westerners. An eloquent memorial of this Atean activity was the Vienna telephone directory (see VI. vii. 235 and IX. viii. 529-30); yet, when the history of the Danubian Hapsburg Monarchy from A.D. 1526 to A.D. 1918 is viewed as a whole in perspective, this Atean twitch does not perceptibly relax the rigidity of the Monarchy's Atlantean stance.

¹ Charlemagne's abortive empire-building cost a nascent Western Society the recrudescence of a post-Hellenic social interregnum (see IV. iv. 490); Timur's cost a nascent Iranic Muslim Society the loss of its opportunity to make itself the heir of the Eurasian Nomad World (see IV. iv. 496-500); the pseudo-T'ang régime that had been installed de toutes pièces in Yamato cost a nascent Japanese Society the harsh experience of subjection to the ascendancy of the unexotically crude marchmen who opened up the Kwanto (see II. ii. 158-9).

necromancy the tragedy had been more ironic than in the drama of resuscitated universal states, since, each time, the first effect had been an Antaeian enhancement of vitality which had tempted self-betrayed Western victims of the Black Art to leap like rabbits into a noose which they themselves had set to wring their own necks. This had been the unvarying outcome of the successive resuscitations of a pre-Alexandrine Hellenic city-state in a Medieval Western Italy, Germany, and Flanders,¹ a post-Alexandrine Hellenic absolute monarchy in almost all provinces of an Early Modern Western World,² and an Hellenic Democracy in Late Modern Western states in which parliamentary constitutions of an indigenous Medieval Western pattern had either succeeded, as in England and her daughter communities, in surviving the impact of the two earlier waves of political Hellenization or else, as in other Western countries, had eventually reasserted themselves, under English inspiration, against the renaissance of a post-Alexandrine Hellenic absolutism.³ The offspring of a resuscitated Hellenic Democracy's impact upon an indigenous Western Parliamentarism was a Nationalism from whose deadly toils a self-tormented Western World was struggling, for dear life, to extricate itself on the morrow of a Second World War.⁴

In the field of the Visual Arts a spectacular example of the Atlantean stance is presented by the sequel to the Modern Western World's reception of the Hellenic order of Architecture. The same Atlantean posture can be detected by a discerning eye in an Assyrian renaissance of a Sumeric style of bas-relief and in a Saïte renaissance of the minor arts of an Egyptiac 'Old Kingdom', while the tragi-comedy of an Atlantean snare set with an Antaeian bait, which we have witnessed in the sequel to successive Western resuscitations of parochial Hellenic political institutions, is reproduced in the sequel to the abandonment of

¹ See III. iii. 299-310, 341-50, and 355-7; and V. v. 619-42.

² See III. iii. 357-9.

³ See III. iii. 359-63. In the English-inspired revivals of a Medieval Western Parliamentarism in Late Modern Continental European Western countries, beginning with the reconvoation of the States General in France in A.D. 1789, there was a vein of academic artificiality which betrayed itself in France in the successive collapses of parliamentary government in A.D. 1799, A.D. 1852, and A.D. 1940; in Germany in the fiasco of 'the Revolution of the Intellectuals' in A.D. 1848, in the discomfiture of the Prussian Liberals by Bismarck in A.D. 1862-3, and in the collapse of the Weimar régime in A.D. 1933; and in Italy in the *de facto* liquidation, in A.D. 1922, of the Sardinian constitution of A.D. 1848. 'The Frankfort Parliament was a highly academic assembly—it contained 49 university professors and lecturers, and 57 schoolmasters, and at least three-fourths of its members had been to a university' (Namier, L. B.: *The Revolution of the Intellectuals* (London 1944, Cumberlege), p. 86, n. 1). In the retrospect of 160 years of disappointing experience, the artificial revival of an indigenous Western Parliamentarism in Continental Western Europe could be seen to be a sickly plant. In the same Time-perspective, however, it was also manifest that the resuscitation of Hellenic Democracy, in the sense of the rival self-deification of parochial human tribes, had been as effective as it had been disastrous. 'The *Volksgeist* of mass-movements replaced the *Zeitgeist* of the intellectuals, and came to be worshipped by the modern *clerics*' (Namier, *op. cit.*, p. 73). 'Democracy', in this archaeologically correct parochial and idolatrous interpretation of a resuscitated pre-Augustan Hellenic ideal, was worshipped by the Napoleons, Mussolinis, Hitlers, and other Late Modern and post-Modern Continental European Western war-lords and dictators as fanatically as it was by any professorial member of the abortive German Parliament at Frankfort in A.D. 1848. What is more significant, it was also worshipped with a no less pagan bigotry, though usually with a greater show of discretion, by better seasoned and less incompetent parliamentarians in Great Britain and in the overseas Western countries of British origin.

⁴ See IV. iv. 156-67.

an indigenous style of Western painting in favour of a resuscitated Hellenic Naturalism. The aesthetic petrification to which a Western school of painting had condemned itself in adopting a dead Hellenic style in place of its own indigenous Western aesthetic ideals is attested by the frustration of the genius of a Dhominikos Theotokópoulos (*vivebat* A.D. 1541-1614), who tried to bring to the rescue of his Hellenizing Western contemporaries the aesthetic ideals of a Byzantine culture that had been tardily relieved of the incubus of the East Roman Empire. As we have noticed in another context,¹ the vista which a Byzantine Greek Theotokópoulos had opened up for Western painters was obstructed for no less than three centuries by the wraith of an Hellenic Greek Apelles, until the eventual exhaustion of an artificially administered Hellenic stimulus at last enabled latter-day Western eyes to see through the mirage by which Giotto had been bemused.

In the field of Philosophy the same ironic denouement was the sequel to the renaissances of a Sinic Confucianism in the Far Eastern World and an Hellenic Aristotelianism in Western Christendom. In the epilogues to both these tales the immediate effect was an Antaeian outburst of intellectual energy, and the eventual effect a stiffening into the Atlantean stance of a dogmatic scholasticism.

The intellectual petrification which was the ultimate effect of an intellectual renaissance in the histories of both these societies is attested in either case by the frustration of a creative genius. In China in the Sung Age, Wang An-shih (*vivebat* A.D. 1021-86), who had foreseen that the Sung Empire would succumb to a barbarian onslaught unless it quickly put its house in order, and who had gone on to work out and translate into action the social reforms required in order to rally the people to the support of the Sung régime and the Far Eastern way of life, lived to see his work undone—with immediate catastrophic consequences—by Confucian litterati in whose eyes he had committed the unpardonable offence of breaking away from preconceived ideas in wrestling with unprecedented problems.² In Western Christendom in the thirteenth century of the Christian Era, Wang An-shih's frustration in the field of Public Administration had its counterpart in Roger Bacon's in the field of Physical Science. The vista which Bacon (*vivebat circa* A.D. 1214-94) opened up by looking at Nature as she was, with the unprejudiced eyes of an empirical observer, was obstructed for no less than four centuries by the straw-stuffed skin and bones of a dead Aristotle posted by the Schoolmen between the jambs of the door which Bacon had unlocked and opened. The obstruction was not removed by the fifteenth-century Italian Humanists' jeering exposure of the truth that this imposingly resuscitated Hellenic figure was a corpse; and Western Man had to wait for admission into a realm that was his own peculiar discovery till an obsolete Hellenic frame of mind was blown away at last by a mine laid and exploded by René Descartes (*vivebat* A.D. 1596-1650). While philosophers may question whether Descartes

¹ In IV. iv. 360-1.

² See Williamson, H. R.: *Wang An Shih* (London 1935-7, Probsthain, 2 vols.), and the present Study, V. vi. 306, with n. 6.

did, or could, divest his mind of all preconceived ideas and set it to work again, *ab initio*, on a genuinely clean slate, historians will not doubt that his naïve belief in the possibility of a new intellectual start, and his bold attempt to put this idea and ideal into practice, did effectually reopen the way for the resumption of a Baconian advance which an Aristotelian obstruction had arrested at the outset of the first day's march.

To the historian's eye, Descartes' supposedly clean slate reveals an unobliterated Christian inscription;¹ for, fortunately for the intellectual future of the two societies that had rashly evoked the ghosts of philosophies created by their predecessors, their uncritical enthusiasm had not availed to make a clean sweep of a living theology in order to enthrone a resuscitated philosophy in its place. In Western Christendom a Saint Thomas Aquinas had been at liberty to enfeoff Aristotle only in so far as he could contrive to do this without trespassing on the already established tenures of those Fathers and Councils of the Christian Church whose authority was recognized in the West; in China the Neoconfucians' nominally integral reinstatement of Confucianism had been achieved only by the sleight of hand with which they preserved, *en masse*, under a Confucian veneer, the tenets of a Mahayanian Buddhist theology which they professed to be rejecting *in toto*. Thus, when the renaissance of a dead philosophy had spent its force and taken its toll, this dubious intellectual adventure did not leave the society that had indulged in it altogether destitute of resources for making a fresh intellectual start; and, though in China this new departure was not taken without the help of a push from alien hands, a Western World which gave a twentieth-century China a salutary intellectual shock was able to perform this service for one of its contemporaries by that date because by then it had already succeeded in throwing off its own intellectual incubus by its own unaided intellectual prowess.

In the field of Law, Greek Orthodox Christendom in the Age of the Macedonian Dynasty partially insured itself against the risks of its evocation of the *Corpus Iustinianum* in the *Vasilikà* by condescending to the same trick that was practised in the China of the Sung Age in the Neoconfucian renaissance of Confucianism. We have noticed already that the compilers of the *Vasilikà* tacitly retained the Christian essence of the legislation of an Iconoclast Syrian Dynasty whose works they were professedly execrating and rejecting. The truth was that, notwithstanding the retrospective anathema that the Iconoclasts had incurred, the Biblical elements out of which they had created their new system of law were sympathetic to the genius of an Orthodox Christian Society to which the pagan Hellenic spirit of a classical Roman Law had become morally repugnant; and the East Roman legislators of the Macedonian Age must have been aware at least intuitively, if not consciously, that the Orthodox Christian public for whom they were legislating would not be able to bear the dead weight of a genuinely integral Justinianean juristic renaissance. They therefore deftly lightened the incubus of the resuscitated Roman Law that they were imposing on the social life of Orthodox

¹ On this point see Butterfield, H.: *The Origins of Modern Science, 1300-1800* (London 1949, Bell), pp. 98-99.

Christendom by resorting to a device that had been employed by the Late Roman Emperor Justinian's own architect Anthemius of Tralles as his solution for the physical problem of imposing a cupola on the cathedral church of the *Αγία Σοφία* without risking a collapse of the supporting pilasters. The light Rhodian bricks of which, according to the legend,¹ Anthemius's ethereal cupola was ingeniously constructed, found their Byzantine juristic counterpart in *Vasilikà* whose ponderous-sounding Justinianean titles were affixed to contents covertly fabricated from the more ethereal substance of the *Ecloga*.

In a Western Christendom where the resuscitation of the Justinianean Roman Law in Orthodox Christendom under the Macedonian Dynasty was emulated, some two hundred years after the time of the East Roman Emperor Basil I (*imperabat* A.D. 867-86), by academic enthusiasts, no corresponding precautions were taken to temper the rigour of an obsolete legal system to the exigencies of a social *terrain* with which it was still more out of keeping than it was with the life of a ninth-century Orthodox Christian World; and it is therefore not surprising to find the 'reception' of the Civil Law in the West having Atlantean sequels. We have seen² how the Hohenstaufen Dynasty's academic pretension to benefit by a post-Diocletianic Roman imperial prerogative, which, in the West, had never been exercised effectively since the death of the Emperor Theodosius I in A.D. 395, committed the Holy Roman Empire to a policy of self-assertion that was so ludicrously beyond its strength that it inevitably resulted in the collapse registered in 'the Great Interregnum' of A.D. 1254-73. This Atlantean doom which the Holy Roman Empire thus brought down upon its own head might have seemed at the time to be offset by an Antaeus sequel to the contemporary reception of the Civil Law in the North and Central Italian city-states. Yet, though the first effect may have been stimulating both in a Late Medieval Western cosmos of city-states and in an Early Modern Western chaos of nation-states, it could be seen in retrospect that the ultimate effect had been Atlantean here likewise; for the reception of an oecumenical Roman Law within the cramping framework of a parochial state had manifestly aggravated the explosiveness of an idolization of parochial sovereignty which the Western World had resuscitated from the charnel house of a pre-imperial Age of Hellenic history.

If, in conclusion of our present survey of Antaeus and Atlantean reactions, we now take a second glance at some of those pilgrimages in which renaissances of elements of dead cultures had been transposed from the Time-dimension into the Space-dimension, we shall observe

¹ According to Lethaby, W. R., and Swainson, H.: *The Church of Sancta Sophia, Constantinople* (London 1894, Macmillan), p. 156, 'there was no trace [in the dome] of the light bricks made in Rhodes which the Anonymous mentions, although in the pendentives a light substance, whitish, with impressions of plants in it, was used in irregular masses'.

An English translation of this *Anonymus Combefisii* (or *Bandurii* or *Lambecii*) will be found *ibid.*, pp. 129-43, and the passage about the Rhodian bricks appears on pp. 136-7:

'The Emperor sent Troilus the cubicular, Theodosius the prefect, and Basileidès the quaestor to Rhodes to have bricks of Rhodian clay made, all equal in weight and length. . . . And they sent bricks of measured sizes to the Emperor—twelve of them weigh [the weight of] one of ours; for the clay is light, spongy, fine, and white.'

² In II. ii. 170-1.

that the auspicious failure of the Crusades saved Western Christendom from the Atlantean fate that it was courting when it tried to slake its thirst for the fountain-head of Christianity by mistranslating a spiritual nostalgia into a military occupation. The Ayyubid and Mamlūk defenders of an embryonic Arabic Muslim Society who evicted the Crusaders from Palestine and their other conquests in Syria, and the Nicene Greek and Ottoman Turkish defenders of a disintegrating Orthodox Christendom who evicted these Western Christian intruders from Constantinople and Greece, compelled the Franks to divert from the Levant to the Baltic and the Atlantic most of the energies that Frankland had to spare for navigation, piracy, maritime trade, and overseas conquest; and this compulsory diversion of energies made the Franks' fortunes in spite of themselves and contrary to the intentions of their victorious Muslim and Orthodox Christian adversaries. In wresting out of Frankish hands the mastery of the Mediterranean, the Mamlūks and the 'Osmanlis pushed the Franks into mastering the Ocean, taking Dār-al-Islām in the rear,¹ winning two new worlds for Western Christendom in the Americas, and establishing a temporary Western ascendancy over the whole face of the planet.

The undesired and unintended benefit that the repulse of the Crusades thus thrust upon the Franks on the whole is demonstrated by a Venetian and a Genoese exception. The Late Medieval Italians' superiority in efficiency over their Transalpine and Transmarine Frankish contemporaries resulted, as we have noticed in another context,² in their gathering into their hands such fragments of the Crusaders' conquests *outré mer* as were not liberated by force of Greek and Turkish arms; and this exceptional success of the maritime Italian city-states in the hour of the Crusaders' general failure in the Levant was one cause of the Italians' own subsequent failure in the hour of the great *peripeteia* in which a Frankish discomfiture was converted into a Frankish triumph through the conquest of the Ocean by the maritime nation-states of Western Europe.

In these feats of West European maritime enterprise individual Venetian and Genoese seamen played parts of outstanding importance. When a progressive exploration of the West Coast of Africa, that had been initiated by the Portuguese Prince Henry the Navigator *circa* A.D. 1421,³ had petered out in A.D. 1448,⁴ the fresh impetus which saved this Portuguese enterprise from missing its manifest destiny was given to it in A.D. 1455-6 by the Venetian Alvise da Ca' da Mosto, who in two successive voyages⁵ turned the flank of Dār-al-Islām by establishing contact, beyond its southern limits, with still pagan Negro African peoples; reached and explored the River Gambia; and perhaps discovered the Cape Verde Islands.⁶ As for a Genoese Columbus who carried the Castilian flag across the Atlantic to the Caribbean threshold of the Mexic and Andean

⁴ See Prestage, op. cit., pp. 92-93.

⁵ See Prestage, op. cit., pp. 94-125.

⁶ Alvise da Ca' da Mosto's, Diogo Gomez's, and Antonio da Noli's rival claims to have been the discoverer of the Cape Verde Islands are discussed by Prestage in op. cit., pp. 122, 140, and 143-4.

worlds, he was Fortune's favoured child among a goodly company of his Genoese fellow countrymen who had been lending their expert professional services to the Iberian Christian kingdoms since A.D. 1317.¹

When individual Genoese and Venetian maritime adventurers were so keenly alive to Western Christendom's possible future on the Ocean, and were so effectively active in helping to translate this possibility into accomplished fact, how came it that the Genoese and Venetian commonwealths let slip, with such fatal consequences for themselves, their own opportunity of playing in this immense new field of Western maritime enterprise the leading part that was theirs for the taking, in virtue of their then still unchallenged supremacy over all other maritime Western Christian states in skill, experience, and wealth? Their geographical location within the basin of an inland sea is not, in itself, enough to account for their failure to compete in the new Oceanic race; for a Mediterranean Sea that was landlocked over against the Indian Ocean had an egress into the Atlantic, and at least a modest share in an Early Modern Western World's oceanic activities was afterwards taken by the Grand Duchy of Courland,² whose location within the basin of the Baltic was quite as serious a geographical handicap in the oceanic race as any to which Genoa and Venice were subject. The underlying explanation of the two Italian maritime commonwealths' failure to respond to the challenge of the Ocean was not a Mediterranean geographical location but was a Levantine commercial, political, and military commitment which was the modern legacy of their medieval success. At the critical moment at the turn of the fifteenth and sixteenth centuries, Venice and Genoa were still being held fast in an Atlantean stance by the baneful incubus of a Medieval Western Christian reversion to Western Christendom's Levantine past out of which these successful Italians had never been shaken by disasters such as had opportunely overtaken their French and Catalan fellow adventurers in that unpromising quarter.

This Atlantean doom was thus Genoa's and Venice's exceptional fate in the sequel to a failure of the Crusades in which the rest of Western Christendom had been saved, in its own despite, by a timely defeat. When however, a nascent Iranic Muslim Society was dragged at the heels of Timur Lenk's war-horse into turning its face away from lands of promise round the shores of the Great Eurasian Steppe towards the cradle of a dead antecedent Syriac Civilization,³ the whole of the aberrant society paid the Atlantean penalty for its demonically wayward war-lord's commission of a sin that had once been the undoing of Lot's wife.⁴ When Timur's conquests in the interior of the Iranic and Arabic Muslim worlds had proved to be as ephemeral as they had been devastating, the Iranic Muslim Society stood as stiff as any pillar of salt while the Mongol and Calmuck pagan Nomads were being converted to the Tibetan Tantric form of Mahayanian Buddhism instead of being converted to the Sunni form of Islam, and while the political dominion over the shores of the Eurasian Steppe was being partitioned between Sinified Manchus and Orthodox Christian Muscovites. This *gran rifiuto*, through which

¹ See Prestage, *op. cit.*, pp. 4-5.

² See IV. iv. 493-5.

³ See IX. viii. 129.

⁴ Gen. xix. 26.

Timur Lenk arbitrarily cheated of its manifest destiny an Iranic Muslim World that he had just liberated from a Chaghatây Nomad ascendancy, is a classic example of an Atlantean sequel to a renaissance translated into the geographical terms of a physical return to an antecedent civilization's cradle.

(III) THE BLESSEDNESS OF IMMUNITY, MERCIFULNESS OF MORTALITY, AND UNTOWARDNESS OF PRECOCITY

An Attic tragedian in a celebrated chorus¹ has declared his conviction that

Not to be born, by all acclaim,
Were best; but, once that gate be passed,
To hasten thither whence he came
Is Man's next prize—and fast, Oh fast!²

Whether we do or do not agree with Sophocles in his pessimistic verdict on the predicament of being born into This World, we can hardly have arrived at the present point in our study of renaissances without feeling sure that at any rate it is best not wantonly to provoke the re-birth of something that has already been born once and that is now obligingly dead, buried, and in abeyance, and that, if on any occasion we have had the temerity to raise the dead, the least awkward denouement to which we can look forward in this ill-advised escapade is to see the *revenant's* disturbing presence laid again as hastily as Fate may allow; for our survey of the courses and consequences of renaissances in the histories of civilizations of the third generation has made it clear that the severity of the penalty that the necromancer will have to pay for having indulged a disembodied ghost's yearning to haunt the land of the living will be proportionate to the vehemence of the craving of the shade in Sheol to be reanimated by a draught of life-blood drawn from a living creature's veins.

The blessedness of immunity from renaissances was attested by the contrasts between the respective fortunes of the Visual Arts and Literature in the Chinese main body of a Far Eastern World, of Architecture and Literature in the main body of Orthodox Christendom, and of Music and Architecture in the West; for the Visual Arts in China, Architecture in Orthodox Christendom, and Music in the West had manifestly each been the master-art of its own culture; and in the history of each of them a renaissance of elements from the past life of an antecedent civilization was conspicuous by its absence. In China an Indo-Hellenic school of art that had been introduced into the Far Eastern World at a pre-natal stage by a Mahāyāna which had served as a chrysalis for the embryo of a Far Eastern Civilization was never disturbed by the re-emergence of a pre-Mahayanian Sinic art. In Orthodox Christendom a Syriac school of Architecture whose archetype was the church of the Ayía Sophía at Constantinople was never disturbed by a revival of the

¹ Sophocles: *Oedipus at Colonus*, ll. 1227-8.

² Gilbert Murray's translation (London 1948, Allen & Unwin), p. 93.

incompatible ideal embodied in the Parthenon at Athens. In the West a school of music that had discarded all but two of the numerous Hellenic 'modes', and, out of these two, had concentrated its efforts on one, was never disturbed by any resurgence of the Hellenic Babel that it had repressed. On the other hand a renaissance was, as we have seen, the dominating event in the histories of a Chinese Far Eastern and a Greek Orthodox Christian literature, as well as in the history of a Western architecture; and it was assuredly no accident that these activities that had been potentially haunted by reanimated ghosts were all convicted of having been dismal failures by confrontation with the brilliant success of contemporary activities in which a living society's native genius had not been blighted by the malign influence of a *revenant*.

The mercifulness of mortality, when the dead have been ill-advisedly brought back to life, is illustrated in the history of a Western Civilization that repeatedly escaped the due penalties for its own perverse feats of necromancy thanks to the premature dissipation of the haunting spectre either by the necromancer's own ruthless hand or by the indulgence of Fate. The Western Civilization earned by its own efforts the relief from an incubus that it won for itself by sending back to limbo, in a seventeenth-century victory of 'the Moderns' over 'the Ancients', the ghost of the Hellenic classics that had been raised in a fifteenth-century Italian renaissance, and by shattering, in the thirteenth-century victory of a Hildebrandine *Respublica Christiana* over a Frederician Holy Roman Empire, the simulacrum of an Hellenic universal state that had been imposed on Western Christendom for the second time at the hands of Otto I. On the other hand the West owed to Fate rather than to any Western foresight or forcefulness the fortunate premature collapse of the Holy Roman Empire after its original installation by Charlemagne, and likewise the fortunate premature expiry of the Carolingian renaissance of an Hellenic literature in its Latin version. Fate was equally kind to Western Christendom in making a fiasco of the Crusades and thereby liberating Western energies from an atavistic adventure in the blind alley of the Mediterranean Basin in order to set them free for encircling the Globe by mastering the Ocean. How much the Western Civilization did gain by the timely reinternment of these inopportune *revenants* in the Sheol from which they had been evoked can be measured by the extent of the damage which the same civilization suffered from a resuscitated Hellenic art and architecture that inopportunely escaped the guillotine, and from a resuscitated Hellenic parochial state that seemed to have an inexhaustible reserve of hydra-heads.¹

At the time of writing in the first century of a post-Modern Age of Western history, the Western Society's continuing failure to exorcize a demon that was as assiduous as it was insidious presented the most formidable of all the pending threats to the Western Civilization's future. Yet, even in this field of Politics, in which it had thus paid so heavy a penalty for having revived an Hellenic parochialism, the Western Society had at least been more fortunate than a sister Orthodox Christian Society in being saved by the successive collapses of the Carolingian and Otto-

¹ See VII. vii. 542-3.

nian resuscitations of an Hellenic universal state from the incubus which had been imposed on the Orthodox Christian Society at the dawn of its history by the disastrous efficacy of Leo Syrus's resuscitation of this oecumenical Hellenic political spectre. A similar comparison between the fortunes of two other sister societies likewise indicated that the Japanese offshoot of a Buddhistic Far Eastern Society had been more fortunate than the main body of the same society in China in being saved by the collapse of a pseudo-T'ang régime in Yamato from the doom which the disastrous efficacy of the T'ang régime itself had eventually brought upon China.

In this connexion we may also notice that even a quasi-immunity is rewarded by a modicum of beatitude. The partial successes of a Mahayanian Buddhist theology in foiling the renaissance of a Confucian Sinic philosophy in the Far East, and of a Syrian Dynasty's Christian legislation in foiling a Macedonian Dynasty's renaissance of a Justinianean Hellenic law in Orthodox Christendom, had, as we have seen, the auspicious effect of attenuating the untoward consequences of these two renaissances for the societies that had done their worst to evoke them.

The untowardness of precocity is likewise illustrated by synoptic views that have already come under our eyes.

For example, in the field of Language and Literature, where the negative or positive value of a renaissance of dead classics can be measured by the blight or stimulus of its influence on the creation of a literature in living vernacular languages, we can see that the effective renaissance of Hellenism in a Greek Orthodox Christendom as early as the ninth century of the Christian Era, less than two hundred years after the emergence of an infant Orthodox Christian Civilization out of a post-Hellenic interregnum, was far more noxious than the effective renaissance of the same Hellenism in the fifteenth century in a Western World which had enjoyed a six hundred years longer immunity from the haunting presence of this Hellenic ghost, thanks to a Carolingian renaissance's fortunate failure. We can also see that, when a Modern Greek people conjured up a ghost of the Attic Greek language at the very moment of its entry as a proselyte into a Western Society's gates, the chimaera of a 'purist' Greek language (*ἡ καθαρεύουσα*), with which it saddled itself in the act, was a still more grievous incubus than an Anna Comnena's Attic *κοινή* or even than a Nicholas Khalkokondhýlis' pseudo-Herodotean Ionic.

In the field of Religion, where the negative or positive value of a renaissance can be measured by its influence in hindering or helping the Soul in its perennial struggle with the sin of Idolatry, we can see that an effective renaissance of a Judaic Aniconism in a Greek Orthodox Christendom as early as the eighth century of the Christian Era partially cured an infant Orthodox Christian Church of image-worship at the cost of committing an Orthodox Christian Society to the likewise idolatrous worship of a ghost of an Hellenic universal state, whereas the renaissance of the same Judaic Aniconism in Western Christendom some eight hundred years later wholly cured a Protestant Western Church of image-worship—though this at the cost of helping to commit

a Modern Western World to the idolatrous worship of a ghost of an Hellenic parochial state.

In the field of political ideas and institutions we can see that the fortunate successive Western fiascos of a Carolingian resuscitation of the Hellenic universal state which collapsed in the ninth century, and of an Ottonian resuscitation of it which collapsed in the thirteenth century, gave the Western Christian Civilization at any rate a longer lease of life than was enjoyed by an Orthodox Christendom which had succumbed to the suicidal sin of state-worship in the eighth century when it had deified the East Roman Empire. The similarly suicidal self-commitment of the Western World to a state-worship in which the idol was a parochial one and in which the idolatry was polytheistic had not captivated the Western World as a whole until the turn of the fifteenth and sixteenth centuries, when this brand of idolatry, with which the Italians had marked their foreheads¹ as early as the eleventh century of the Christian Era, was painstakingly reproduced by all the other peoples of a *ci-devant* Christian Western World.

If we now go on to ask ourselves why the most prudent counsels for any living soul that is playing with the Black Art should be—as History shows them to be—‘That thou doest, do slowly [*sic*]² and ‘Better late, best never’, we may find an answer to our question in the principle ‘One man’s meat is another man’s poison’ which our foregoing study of encounters between contemporaries³ has brought to light; for this ‘law’ is also operative in encounters in which the parties are a necromancer and a ghost.

In an encounter of any kind, an invasion of the life of one of the *dramatis personae* by some element in the life of another of them which has been torn out of its original context and has been introduced in isolation into an alien social milieu can, indeed, hardly fail to be a highly disturbing event in the history of the invaded party. The effect of a twelfth-century Western renaissance of Aristotelianism in suspending the creative activity of Western Christian thought has been noticed by a distinguished Modern Western student of the Medieval Western Mind;⁴ and the consequences of a renaissance may be still more baneful when its influence is stimulating than when it is repressive. Great, for example, as was the havoc wrought in Hellenic history by the Hellenes’ sin of idolizing their parochial states, the havoc was still greater⁵ when this particular form of Hellenic idolatry was resuscitated in a Western Christendom where the vein of Judaic fanaticism inherent in Christianity was lying in wait, ready to inspire an Hellenic parochial state-worship imported from the shadow-realm of Hades with a demonic intensity which it had never attained in even the deadliest of its pristine manifestations on its native heath in a heathen Hellenic World whose life it had brought to a premature bad end.

The extent, however, of the ravages which a renaissance will thus, in

¹ Rev. xiii. 16; xiv. 9; xix. 20; xx. 4.

³ See IX. viii. 530-42.

⁴ Taylor, H. O.: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. i, p. 17.

⁵ See the passage on p. 194 of Guglielmo Ferrero’s *Peace and War*, English translation, London 1933, Macmillan, that has been quoted in VII. vii. 542-3.

the nature of the event, be apt to make in the psychic constitution of the necromancer will manifestly be apt to vary in accordance with the degree of the patient's powers of resistance at the time when he wantonly infects himself with the bacillus; and in the history of a healthily growing civilization, so long as the growth has not been cut short by a breakdown, we may presume that every further decade, generation, and century of growth will enhance the robustness of the growing body social's constitution and accordingly will, to that degree, increase its capacity for carrying Atlas' load without collapsing under the weight of the incubus, even if the patient's vitality, in the hour of crisis, does not prove lively enough to enable him to avoid falling into an Atlantean stance by responding to the challenge with an Antaeian rebound. The better the spiritual health of the victim of a renaissance at the time of his self-inflicted ordeal, the better his chance of metabolizing the uncanny treasure that he has wrested from the coffers of Hades, and, in metabolizing it, constraining it to serve his weal as an elixir instead of working his woe as a cancer. A subconscious awareness of these saving truths reveals itself in phenomena that have already come to our notice in the present Part of this Study. This is, in fact, the reason why divers elements in the culture of a dead antecedent civilization are apt to be resuscitated in a chronological order that is the inverse of their original sequence in the history of the civilization that has been their native milieu.¹ It is also the reason why a necromantically inclined society is apt to discriminate among the ghosts that are within range of its magician's wand by studiously ignoring shades whose psychic stature would dwarf the wizard's if he were so foolhardy as to reanimate them, while at the same time he may be eagerly courting other shades whose psychic stature is not thus unmanageably incommensurate with his own.²

(IV) THE STERILITY OF THE BLACK ART

Even, however, when a necromancer avoids or escapes the nemesis of being enslaved by a ghost that he has reanimated at his own expense by nurturing it with a transfusion of his own life-blood, the sterility to which even the least noxious achievements of the Black Art are condemned *ex officio originis* is exposed remorselessly when these are compared with the contemporary achievements of a necromantic society's native genius.

In the field of politics, for example, it is evident that, in the Medieval chapter of Western history, the master-institution was not an *Imperium Romanum Redivivum* but was a newly created Papal Roman *Respublica Christiana*,³ and that in Arabic Muslim history it was, not the Cairene ghost of an 'Abbasid Caliphate, but a novel self-recruiting Mamlūk corps, that endowed this society, in its infancy, with the strength to hold its own even against the world-conquering Mongols.⁴ In the modern chapter of Western history, again, the indigenous Western institution of parliamentary representative government eclipsed the resuscitated Hellenic

¹ See pp. 124-30, above.
² See IV. iv. 405.

² See pp. 130-7, above.
⁴ See IV. iv. 446-50.

institution of a demagogic Democracy that was apt—first in city-states in Italy after A.D. 1254 and then in a nation-state in France after A.D. 1789—to turn, as fast as milk turns in thundery weather, into the sour brew of a plebiscitary dictatorship. In the field of Law the genius of an Orthodox Christian Civilization revealed itself, not in a Macedonian Dynasty's revival of a dead Justinianean Hellenic law, but in an antecedent Syrian Dynasty's new creation of an East Roman law inspired by Christian principles. In the field of Philosophy, likewise, the genius of a Far Eastern Civilization revealed itself, not in the revival of a dead Confucianism, but in the foregoing new creation of indigenous Far Eastern philosophies inspired by Mahayanian Buddhist thought, while, in the intellectual history of a Medieval Western Christendom, the genius of Saint Thomas Aquinas revealed itself, in his *Summa Theologica*, not in the resuscitation of Aristotelian theses but in the construction of a system that was the Angelic Doctor's own.¹ In the field of Physical Science the Medieval Western Schoolmen's revival of the intellectually vicious Hellenic practice of arguing about the phenomena of Physical Nature *in vacuo*, as if Logic could do duty for verification, threatened to sterilize, and succeeded in retarding, the harvest that was to be garnered from the application of an experimental method of research in accordance with the Western Civilization's native bent.² In the field of Language and Literature the all but flawlessly Ciceronian Latinity of an Erasmus, who had taught himself to speak with the tongues of men and of angels, was become as sounding brass or a tinkling cymbal³ in a Modern Western house of many mansions⁴ that had been filled with a sound as of a rushing mighty wind⁵ by a vernacular poetry in a chorus of divers living Western languages, while, in a contemporary Far Eastern World, a creative art of the Drama and the Novel, conveyed in a living 'mandarin' *lingua franca*, had likewise eventually taken the light out of a pedantic reproduction of the style and themes of the Sinic classics. In the field of the Visual Arts an Orthodox Christian Civilization's miniature reminiscences in ivory of an Hellenic style of bas-relief carving in marble turn deathly pale, exquisite though they are, in the presence of mosaics glowing and vibrating with a veritable life engendered by the fruitful marriage of an indigenous Byzantine creativity with an indigenous Byzantine technique.

The last word on the comparative merits of the realm of Hades and the land of the living was spoken to Odysseus by the shade of Achilles:

'I would rather be a wretched peasant on the land, labouring as a serf with a poor portionless man for my master, than be sovereign lord of all the legions of the shades of the dead and departed.'⁶

¹ This point is made by Taylor, H. O.: *The Mediaeval Mind* (London 1911, Macmillan, 2 vols.), vol. i, p. 18, and vol. ii, p. 437.

XI

LAW AND FREEDOM IN HISTORY

A. THE PROBLEM

(I) THE STATE OF THE QUESTION

WHEN the writer was planning the present Study in the summer of A.D. 1927, he saw that he would have to grapple with the problem of the respective roles of Law and Freedom in human history before he could attempt to win a Pisgah sight of the prospects of the Western Civilization. Yet in the winter of A.D. 1928-9, when, with that ulterior objective in mind, he was drafting his notes for eventually writing the present Part, he was conscious that the fateful question then still seemed academic to most people in Western countries that had been either neutral or on the winning side in the World War of A.D. 1914-18. In the June of A.D. 1950, when, after a seven-years-long interruption extending over the years 1939-46, he at last reached this point in the writing of the book, he found himself working in a new atmosphere that was decidedly more congenial to his theme.

By the year A.D. 1950 the survivors of a generation of Westerners that had fought two fratricidal world wars in one lifetime had emerged from the second of these unprecedentedly destructive conflicts of a traditional military kind only to find itself engaged in a 'cold war' which was neither less arduous nor less critical for being less barbarous than a twice-played military overture in which the *encore* had surpassed the first performance; and these disillusioning and disquieting experiences had brought about, in most living Western souls, a revolutionary change of feeling and outlook. By this time, most Westerners had become aware that their own civilization was in danger of coming to grief; and reflection had then reminded them that this was, after all, no novel prospect in an historical arena in which most, if not all, other human societies of the same species had come to grief already. The living generation in the West was, in fact, beginning to look at the facts of History as these presented themselves to the naked eye, instead of continuing to peer at this formidable spectacle through smoked glasses inherited from its grandparents; and, in the light of luminous facts which they were at last allowing themselves to see, they were asking themselves questions that would have shocked their grandparents if these could ever have dreamed of formulating them.

The generation of *Homo Occidentalis* that had already been in its dotage in A.D. 1914 had been the latest generation to hold, with an unquestioning faith, a dogma which, by then, had been serving for a quarter of a millennium as the gist of a Late Modern Western Man's mechanically desiccated and peptonized religion. This fallaciously comfortable doctrine was that the Western Society could see ahead of it an unbroken vista of progress towards an Earthly Paradise, and that its

triumphant advance along this open avenue was inevitable, since the only 'law' binding upon a *Homo Sapiens* who was free to shape his own future in every other respect was 'a law of progress' rendering a wishful thinker's desires inevitable.

In A.D. 1950 the grandchildren of these Victorian Last of the Mohicans were asking themselves questions that had been formulated for Western inquirers on the morrow of the First World War by Oswald Spengler, a pontifical-minded man of genius thinking and writing in the psychological milieu of a country which had then just suffered what, by the still moderate standards of the day, had been a shattering military defeat. Some thirty years after the publication of the first edition of *Der Untergang des Abendlandes* in A.D. 1919, a chorus of Western voices was echoing Spengler's prescient questionnaire. Are the great tribulations that we have suffered, and the greater tribulations that we forebode, the products of 'laws', beyond our control, that turn out to be no 'laws of progress'? If such unpleasant laws are, in truth, in operation, do these govern the whole of Human Life, or are there some provinces or planes of Life in which Man is his own master—free, within those limits, to find remedies, through his own action, for evils that are of his own making? If human affairs should prove to be thus under dual control, then what affairs are under our own control and what are governed by 'Law'? And, if we do find that Man's stable contains a loose-box, can we use this islet of freedom as a *ὅπου στῶμεν* from which—by virtue, wisdom, and work—we may perhaps succeed in enlarging the borders of the province under Man's control at the expense of the province under the dominion of 'Law'?

The German philosopher who led the way in putting these disturbing new questions into once complacently sluggish Western minds went on to give to all of them one comprehensive dogmatic answer of his own. The true law of Human Social Life, he laid down, was not a law of inevitable progress; it was a law of inevitable breakdown, disintegration, and dissolution—and this within a Time-span which was perhaps even more inflexibly uniform than the life-spans of living organisms. Happily, the adoption of Spengler's fateful questions did not commit his fellow Westerners to endorsing, in advance, the German hierophant's oracular response to his own shrewd inquiry; and, since in other contexts we have already exposed the fallacy of Spengler's confusion of societies with organisms¹ and the groundlessness of his belief in the omnipotence of the savage goddess Necessity,² we can regard the questions asked and answered by Spengler as being, *pace Spengleri*, still open.

(II) DEFINITIONS OF TERMS

In venturing, without prejudice, to seek a fresh answer of our own to the question whether human affairs are governed by laws, our first step must be to define what we mean by 'laws' and by 'human affairs'.

In the context of our present Study, 'human affairs' manifestly mean, not Medicine, but the Humanities; not the organic chemistry, biology,

¹ See III. iii. 219-23.

² See IV. iv. 7-39.

and physiology of the human body, but the affairs of human beings in that spiritual aspect of Humanity in which Man is a person with a consciousness and a will moving on the face of the waters¹ of a subconscious psychic abyss, and not in the physical aspect in which Man is a body whose chemical constituents can be analysed, weighed, measured, and priced at their current value in the market for material commodities. If, for our purposes in this Study, we define the term 'human affairs' in the spiritual sense, we can see that our field of human affairs articulates itself into four provinces occupied respectively by the Soul's diverse relations with God, with its own self, with a relatively small circle of other human beings with whom it is in direct personal communion, and with a relatively large circle of people with whom it is in indirect impersonal contact through the mechanism of institutions.² We shall be reconnoitring all four provinces in this Part of our Study.

In this same context, 'law' manifestly does not mean the man-made legislation which is, of course, the only authentic 'law' in the literal sense of the word, and which is also the only law with which we have a direct acquaintance in our immediate day-to-day human experience. The 'law' with which we are concerned in this Study resembles this familiar man-made institution in being a set of rules governing human affairs; but the differentia of this so-called 'law' is that it is not made by Man; and, in using the term with this transference of meaning, we are attributing the characteristics of a known human institution to the enigmatic working of a mysterious Universe. In resorting to this linguistic expedient of metaphor we are flagrantly guilty of Anthropomorphism; and, if we cannot—as indeed we cannot—reach our goal without taking this flight of the imagination, we must recognize that, in transporting a word from the social to the metaphysical sphere, we cannot help transporting the word's connotations together with the label to which these notions adhere. The inherent threat to the accuracy, as well as to the clarity, of our thought is as evident as it is unavoidable; and the most effective safeguard against it will be to remind ourselves, in advance, what these *a priori* connotations of the word 'law' are.

The most striking characteristic of man-made law is that it is intended to apply consistently in uniform circumstances in all human situations that are deemed to fall within the scope of whatever the particular law may be. By implication the law is intended to be imposed impartially, and to be enforced effectively, upon all and sundry who come within its ambit. Furthermore, the law is intended, not only to be consistently formulated and applied and to be impartially and effectively administered, but also to be, and to be recognized by all concerned as being, morally right. Since, however, Human Nature is lamentably imperfect in morals, intelligence, and practice alike, and since this all-pervasive imperfection is ubiquitously reflected in the unsatisfactoriness of Man's conduct of his human affairs, even the best law known to History is never quite just, never quite effectively or impartially administered, and never quite consistently applied or formulated.³ A perfectly consistent

¹ Gen. i. 2.

² See I. i. 45-5 and III. iii. 223-30.

³ There were on record notorious cases in which a community's will or power, or

formulation of the law is indeed inherently impossible, since the most acute and supple intellectual operations of the most consummate legal genius would be unequal to coping with the subtlety and complexity of the concrete human affairs with which a lawyer's abstractions have to deal.

This intractability of Life to Law accounts for the moral ambivalence which is an ineradicable trait of Law and an irrefutable testimony to the power of Original Sin. The impersonal objectivity that is the Law's acknowledged ideal had been mocked, in every actual law that had ever been enacted since the dawn of legislation, by the unmistakable reflection in it of some personal bias unjustly favouring one 'interest' by unjustly penalizing another. The perfect justice of a God who 'is no respecter of persons',¹ and 'who, without respect of persons, judgeth according to every man's work',² had never been exhibited by any human legislator. Even the least unscrupulous and most disinterested human legislation had always perceptibly reflected in some degree the play of current religious, economic, political, military, and other social forces. Yet, even if we could imagine the advent of an omnipotent human legislator who was at the same time perfect in every faculty of the Human Spirit, the disinterested impersonality that would be the glory of this imaginary paragon's legislation and dispensation of justice would be concurrently the scandal of his work, since a law that can never be sufficiently impersonal in the sense of ignoring the personal interests of the legislator, the judge, and the administrator can also never be sufficiently personal in the sense of allowing sufficiently for the personal circumstances of each and every human soul who is subject to this law and whose case is *sub judice*. The inherent, and consequently inescapable, dilemma of all human legislation and legal proceedings is that, in so far as the Law succeeds in being impersonal, it necessarily achieves this at the odious price of treating human souls—which are individual and unique—as if they were mass-produced, standardized non-human objects like coins or bricks or pounds of butter or sacks of coal, while, in so far as it succeeds in making allowances for personal circumstances, it necessarily achieves this at a risk of grievously departing from an impartiality that is of the essence of human justice.

This was the historical human social context from which the name and notion of 'law' had been transferred to a metaphysical context by a resort to the perilous yet unavoidable expedient of Anthropomorphism. At an earlier point in this Study³ we have noticed that the social milieu in which this flight of the human imagination is apt to be made is the experience of a disintegrating society that has won a reprieve for itself by a political union within the framework of a universal state; and we have observed that, in these social circumstances, the idea of law is apt, in

both, to administer the law impartially and effectively had lagged far behind its will or power, or both, to formulate and apply the law consistently. One instance was the state of the municipal law of the Icelanders in the tenth century of the Christian Era; another was the state of the international law of the sovereign states of the Western Society in the twentieth century of the same era. The sequel in Iceland (see II. ii. 357, n. 2) suggests that an anarchy of this repulsively sophisticated type is apt to bring itself to a speedy end by inviting the intervention of some masterful alien hand.

¹ Acts x. 34.

² 1 Pet. i. 7.

³ In V. vi. 15-17.

the act of being translated from the social to the metaphysical plane, to become polarized into two apparently antithetical concepts. For minds in whose mental vision the personality of the human legislator, judge, and administrator looms larger than the law of which he is at once the master and the servant, the metaphysical 'law' governing the Universe is the law of a unique and omnipotent God pictured in the image of a human Caesar.¹ For other minds, in whose vision Caesar's figure is eclipsed by a human law that is impersonally formulated, applied, administered, and enforced—such as 'the Law of the Medes and Persians which altereth not',² that was the oecumenical law of the Achaemenian Empire—the metaphysical 'law' governing the Universe is the law of a uniform and inexorable Nature. In this diffracted vision, metaphysical 'law' in the guise of 'a Law of God' and metaphysical 'law' in the guise of 'laws of Nature' present between them the double-faced countenance of a Janus, and in either face there are—as in the human law of every-day life—both consoling and horrifying features.

The horrifying feature in 'the laws of Nature' is their inexorability; for, although, in theory, these 'laws' may be scheduled as being *de jure* mere 'by-laws' or 'secondary causes' subject to the fiat of a 'First Cause' that will then be identified with God, in practice they will be taken as being *de facto* autonomous. 'The laws of Nature', in fact, fulfil the Medes' and Persians' ideal of laws that cannot ever be repealed or ever even be revised in the light of experience.³ This inhuman quality of inexorability is horrifying indeed, yet its moral enormity carries with it an intellectual compensation; for laws in which there 'is no variableness, neither shadow of turning',⁴ will on that very account be ascertainable, both exactly and definitively, by a human intelligence; and, while no more than isolated fragments of these 'laws of Nature' may be thus ascertainable at any particular time and place by any particular human mind, their intrinsic stability and permanence render them accessible to a process of progressive exploration by a Collective Human Intellect.⁵ A knowledge of Nature thus appears to be within Man's mental grasp, and there is a sense in which this knowledge is power; for human beings who know Nature's unvarying laws and who can therefore predict with certainty which way she is going to jump will not only be able to dodge this inhuman monster's aimless blows; they will also be able to harness the energy generated, released, and expended in these undesigned operations, and so to turn this energy to account for serving human purposes (in so far, of course, as individual human wills can agree on what their common purposes shall be). And thus a Collective Human Intellect, which cannot divert the inexorable course of Nature by a hair's breadth, can nevertheless make a world of difference, for good or for evil, to the effect of the play of laws of Nature on human affairs by bringing into action technological devices that can effectively control, not the operation of these laws, but the incidence of their operation on Man's life.

² Dan. vi. 8 and 12.

³ 'Biological progress exists as a fact of Nature external to Man' (Julian Huxley, in his 'Conclusion' to T. H. and J. Huxley: *Evolution and Ethics, 1893-1943* (London 1947, Pilot Press), p. 182).

⁴ Jas. i. 17.

⁵ See pp. 697 and 701, below.

All the same, the limits within which even the most ingenious human technology can outmanœuvre a railbound Nature are narrowly circumscribed.

'Canst thou draw out Leviathan with an hook? Or his tongue with a cord which thou lettest down? Canst thou put an hook into his nose? Or bore his jaw through with a thorn? Will he make many supplications unto thee? Will he speak soft words unto thee? Will he make a covenant with thee? Wilt thou take him for a servant for ever? Wilt thou play with him as with a bird? Or wilt thou bind him for thy maidens? Shall the companions make a banquet of him? Shall they part him among the merchants?'¹

The Stellar Universe, which was the first field in which any exact and systematic discovery of 'laws of Nature' was ever made by the Collective Intellect of Man in Process of Civilization, had not yet been made amenable to technological manipulation at the time of writing; and a Late Modern Western Man's world-conquering intelligence had liberated him from the astrologer's mistaken belief that human affairs were at the mercy of malignant influences emanating from the inexorable courses of the stars, only to convince him of a truth that convicted him of sin. The successive discoveries of a 'know-how' for navigating the air and splitting the atom in a society that had not yet rid itself of the institution of War had made it manifest to a technologically triumphant generation that the malignity of Leviathan 'is not in our stars but in ourselves'.²

A human soul that has been convicted of sin, and been convinced that it cannot achieve its own reformation without the help of God's grace, will opt, like David, to fall into the hand of the Lord and not into the hand of Man.³ An inexorability in punishing, as well as in exposing, Man's sin, which is the Last Judgement of 'the laws of Nature', can be overcome only by accepting the jurisdiction of a 'Law of God'. The price of this transfer of spiritual allegiance is a forfeiture of that exact and definitive intellectual knowledge, with its attendant technological power, which is the material prize and the spiritual burden of human souls that are content to be Nature's masters at the cost of being her slaves. 'It is a fearful thing to fall into the hands of the living God';⁴ for, if God is a spirit,⁵ His dealings with human spirits will be unpredictable and inscrutable, as the acts of any personality always are for any other personality that has to meet its kind in an encounter. In appealing to the Law of God, a human soul has to abandon certainty in order to embrace Hope and Fear; for a law that is the expression of a will is animated by a spiritual freedom which is the very antithesis of the *saeva necessitas* of laws of Nature, and an arbitrary law may be inspired either by redemptive Love or by vindictive Hate, may be administered either by making a winning appeal or by exerting an overbearing compulsion, and may be designed to promote either good or evil. In casting itself upon the Law of God, a human soul is apt to find in this what it brings to it; for in the mirror of God's perfection it will see a reflection of itself, and hence Man's notions of the Law of God have run to irreconcilable extremes of

⁵ John iv. 24.

diversity, in which a *visio beatifica* of God the Father wars with a *visio malefica* of God the Tyrant. This conflict of incompatible visions will exercise us throughout this Part. At the present stage we have merely to take note of the indisputable truth that both visions alike are consonant with the image of God as a personality pictured in the anthropomorphic guise beyond which the human imagination seems to be impotent to penetrate even in its farthest flights of intuition.

(III) THE ANTINOMIANISM OF LATE MODERN WESTERN HISTORIANS

(a) THE REPUDIATION OF THE BELIEF IN A 'LAW OF GOD' BY LATE MODERN WESTERN MINDS

The idea of a 'Law of God' had been wrought out by the travail of the souls¹ of Israelite and Iranian prophets in intuitive responses to the challenges of Babylonian and Syriac history, while the classical expositions of the concept of 'laws of Nature' had been blue-printed by philosophic observers of the disintegration of an Indic and an Hellenic World. Yet, though these might be the illustrations of the two possible schools of metaphysics that would occur most readily to a twentieth-century Western mind, we have already observed² that one or other of the two concepts had been embraced in some form by the children of almost all civilizations that had met with the experiences of breakdown and disintegration.

Moreover, both concepts can be entertained by the same mind at the same time without any prohibitive inconsistency; for, even if they were incompatible in the theoretical sense of being logically irreducible to unity,³ this would not *ipso facto* make them incompatible in the practical sense of its being inconceivable that these two kinds of Law should be in force simultaneously side by side. We can, indeed, conceive of them as being co-regnant, not only without conflict, but in positive co-operation

¹ Isa. xliii. 11.

² In V. vi. 15-49.

³ Actually, the gulf between the repetitive recurrent regularity of 'a law of Nature' and the purposively, and therefore non-repetitively, persistent regularity of the Law of God appears to be unbridgeable only so long as we forget that, in thinking of the phenomena in which 'a law of Nature' manifests itself, the thinking human mind itself is a party to the situation.

There is a sense in which the mind's faculty of memory—reinforced and amplified in its range by the social technique of making and preserving records—converts every repetitive cyclic movement into a unique one-way movement (i.e. a movement of the same character, in this respect, as the movement manifested in the Law of God). When the repetitions of the phenomena are not unrealistically abstracted from their subjective setting, it is manifest that Repetition No. $x+1$ differs from Repetition No. x not merely quantitatively but also qualitatively, because the apprehension of it carries with it a memory of x previous instances, whereas the apprehension of No. x carries with it a memory of $x-1$ instances only.

'Let us take the most stable of all internal states: the visual perception of an exterior object at rest. It is in vain that the object remains the same, and that I look at it from the same side, from the same angle, in the same light: the vision that I have of it differs, none the less, from the vision that I had of it just now—if only because it has aged by the quantum of one instant. My memory is there, and my memory injects something from this past into this present. My mental state, as it advances along the track of Time, is constantly swelling its bulk with the duration that it is amassing; it is making, so to speak, a snowball of itself' (Bergson, H.: *L'Évolution Créatrice*, 24th ed. (Paris 1921, Alcan), p. 2).

with one another, in virtue of the very diversity between the two notions of regularity which they respectively embody. 'The Law of God' reveals the regularity of a single constant aim pursued unwaveringly, in the face of all obstacles and in response to all challenges, by the intelligence and will of a personality. 'Laws of Nature' display the regularity of a recurrent movement—for instance, the motion of a wheel revolving any number of times round its axis. If we could imagine a wheel coming into existence without owing its creation to a wheelwright, and then revolving *ad infinitum* without ever serving any purpose, these 'repetitions' would indeed seem 'vain';¹ and this was the pessimistic conclusion drawn by Indic and Hellenic philosophers from a *Weltanschauung* in which, by a *tour de force* of intellectual abstraction, they had set 'the sorrowful wheel of existence' turning 'for ever *in vacuo*'. In real life, of course, we find no wheels without wheelwrights, and no wheelwrights without drivers who commission these artificers to build wheels and fit them to carts in order that the wheels' repetitive revolutions may recur, not in vain, but for the practical and practicable purpose of conveying a cart towards the driver's intended goal. 'Laws of Nature' make sense when they are pictured as being the wheels that God has fitted to His own chariot;² and a truth that is true of the orbits of the stars in courses laid down for them by an act of God's power is no less manifestly true of recurrent spiritual responses to the challenges of God's love, such as a human soul's experience of sin, fall, penitence, and grace, or a human society's experience of breakdown, disintegration, and illumination by the spark of creativity that announces the epiphany of a higher religion.³

In fact, the apparent incompatibility between the two kinds of regularity is merely a mirage in the shadow-world of abstract logic; in real life they are not only compatible with one another but are inseparably complementary in a divinely inspired interplay in which, at divers levels of Reality, cyclic movements according to laws of Nature are successively transcended in experiences and endeavours that, in turn, are subject to cyclic movements at a higher level from which, in turn, still higher experiences and endeavours spring. The astronomical day-cycle and year-cycle are transcended in the cumulative experience and endeavour of a human being's life-time. A life-time is subject to the biological generation-cycle, and this in turn is transcended in the cumulative experience and endeavour of a human society in process of civilization. A civilization is subject to a menacing possibility (though not to an inexorably predetermined doom) of breaking down and disintegrating, and the breakdowns and disintegrations of civilizations in turn are transcended in the cumulative spiritual progress of Religion through learning by suffering. This cumulative progress of Religion—which is the spiritually highest kind of experience and endeavour within the range of Man on Earth—is a progress in the provision for Man, in his passage through This World, of means of illumination and grace for helping the pilgrim, while still engaged on his earthly pilgrimage, to attain a closer communion with God and to become less unlike Him.⁴

¹ Matt. vi. 7.

³ See I. i. 57 and VII. vii. 551-5.

² See IV. iv. 34-38.

⁴ See VII. vii. 563-4.

If our two concepts of the character of metaphysical 'law' can thus both be held simultaneously by the same mind, and if at any rate one or other of them has actually been held by the children of most of the civilizations known to History, it is not surprising to find that the Western Christian Civilization was originally no exception to this rule. A belief that the whole life of the Universe was governed by 'the Law of God' was the *qiblah* of a Judaic *Weltanschauung* that was the common heritage of the Orthodox Christian, the Western Christian, the Arabic Muslim, and the Iranic Muslim societies; and a theocentric philosophy of history derived from the intuitions or inspirations of the Prophets of Israel and Judah and the Iranian Prophet Zarathustra was bequeathed to Western Christendom in Saint Augustine's *De Civitate Dei* and to the Arab Muslim World in Ibn Khaldūn's *Prolegomena* to his *History of the Berbers*—two works of spiritual genius which unmistakably reflect one single common outlook and whose mutual affinity can only be accounted for by their indebtedness to a common source, since Ibn Khaldūn was as ignorant of his Christian predecessor and fellow Maghribī's theodicy as Augustine was of *Muqaddamāt* that did not see the light till more than nine hundred years after the Christian North African Father's death.

The Augustinian version of a Judaic view of history was taken for granted by Western Christian thinkers throughout the first millennium (circa A.D. 675–1675) of the Western Civilization's life and was reformulated—to incorporate the additions made to Western knowledge since the fifteenth century of the Christian Era by an Italian renaissance of Hellenism and an Iberian conquest of the Ocean—in a *Discours sur l'Histoire Universelle* published in A.D. 1681 by Jacques-Bénigne Bossuet (*vivebat* A.D. 1627–1704). The Eagle of Meaux's majestic variation on a traditional Judaic theme was, however, the last serious Western performance of this spiritual masterpiece; for, while Bossuet was in the act of writing his classic discourse, a spiritual revolution was taking place around him in his world. Within the brief span of the last few decades of the seventeenth century of the Christian Era, a Western World that was exorcizing a stalking ghost of Hellenism¹ was at the same time liquidating its own ancestral Judaic *Weltanschauung*.

This Late Modern Western act of apostasy has an explanation which is also an excuse. The Western exponents of the view that History was governed by a 'Law of God' had 'given great occasion to the enemies of the Lord to blaspheme'² by allowing themselves to fall into an anthropomorphic misconstruction and misrepresentation of the Prophets' and Evangelists' insight into the relation established between God and Man by God. The heart of the Judaic discovery—or revelation—had been an intuition of the truth that, in virtue of a love, forbearance, and self-abnegation (κένωσις)³ that were the stigmata of God's divine creativity, God's service is Man's perfect freedom⁴ and God's Law is a perfect law of liberty;⁵ but this revelation had become blurred in human hearts and

¹ See pp. 62–73, above.

² 2 Sam. xii. 14.

⁵ Jas. i. 25 and ii. 12.

minds because the mystical experience of the relation between Man and God was not, and could not be, reproduced in the practical experience of any relation between Man and Man in an exclusively human social milieu. A coercive justice that vindicated an imperfect freedom by usurping a perfect freedom's place was the best that Man, following his own devices, had found himself able to make of the bad business of trying to hold together a society of sinners who showed themselves humanly ungodlike in standing upon their own rights and in envying their neighbours' prosperity even when it was inoffensive and legitimate; and the Prophets' God-given vision of God had only to falter and fade for the bleared eyes of the Prophets' children to misread 'the Law of God' by interpreting the word 'law' literally in terms of a familiar human law in which the Prophets had found their inadequate but indispensable human symbol for speaking of divine thoughts and ways that, being God's, were ineffable.¹

This travesty of a Christian intuition of 'the Law of God' has been accurately described and erroneously identified with the reality in the following summary account of it by a post-Modern Western historian-philosopher.

'Any history written on Christian principles will be of necessity universal, providential, apocalyptic, and periodized. . . . If challenged to explain how he knew that there was in History any objective plan at all, the mediaeval historian would have replied that he knew it by revelation; it was part of what Christ had revealed to Man concerning God. And this revelation not only gave the key to what God had done in the past; it showed us what God was going to do in the future. The Christian revelation thus gave us a view of the entire history of the World, from its creation in the past to its end in the future, as seen in the timeless and eternal vision of God. Thus mediaeval historiography looked forward to the end of History as something fore-ordained by God and through revelation foreknown to Man. It thus contained in itself an eschatology.'²

While we may challenge our historian-philosopher's claim to have expounded the theology of the Bible, we must concede that his picture is a trenchant *exposé* of the misconception entertained by Bossuet; for the guileless bishop of Meaux has furnished us with inculpatory evidence against himself.

'Ce long enchaînement des causes particulières qui font et défont les empires dépend des ordres secrets de la divine Providence. Dieu tient du plus haut des cieux les rênes de tous les royaumes; il a tous les cœurs en sa main: tantôt il retient les passions, tantôt il leur lâche la bride, et par là il remue tout le genre humain. . . . Dieu exerce par ce moyen ses redoutables jugements, selon les règles de sa justice toujours infaillible. C'est lui qui prépare les effets dans les causes les plus éloignées et qui frappe ces grands coups dont le contre-coup porte si loin.'³

In Bossuet's picture a Medieval Western Christian imaginary portrait

¹ Is. lv. 8.

² Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), pp. 49 and 54.

³ Bossuet, J.-B.: *Discours sur l'Histoire Universelle*, 3rd ed. (Paris 1700), Troisième Partie, chap. viii.

of God the Tyrant has been brought up to date by painting over the naïve original the more sophisticated lineaments of a Louis XIV; and our historian-philosopher has good ground for asserting that

'In Mediaeval thought the complete opposition between the objective purpose of God and the subjective purpose of Man, so conceived that God's purpose appears as the imposition of a certain objective plan upon History quite irrespective of Man's subjective purposes, leads inevitably to the idea that Man's purposes make no difference to the course of History, and that the only force which determines it is the Divine Nature.'

This reading of a distorted Medieval Western Christian *Weltanschauung* is borne out by a scrutiny of Early Modern Western reproductions of it.

Bossuet, for example, delivers himself into his critics' hands when he seeks to justify his picture of God's plan by placing this under a magnifying glass.

'Vous voyez un ordre constant dans tous les desseins de Dieu, et une marque visible de sa puissance dans la durée perpétuelle de son peuple. . .

'Plus vous vous accoutumerez à suivre les grandes choses et à les rappeler à leurs principes, plus vous serez en admiration de ces conseils de la Providence. Il importe que vous en preniez de bonne heure les idées, qui s'éclairciront tous les jours de plus en plus dans votre esprit, et que vous appreniez à rapporter les choses humaines aux ordres de cette sagesse éternelle dont elles dépendent. . .

'Trois choses devaient . . . concourir ensemble: l'envoi du Fils de Dieu, la réprobation des Juifs, et la vocation des Gentils. . . L'Église, victorieuse des siècles et des erreurs, ne pourra-t-elle pas vaincre dans nos esprits les pitoyables raisonnements qu'on lui oppose; et les promesses divines, que nous voyons tous les jours s'y accomplir, ne pourront-elles nous élever au-dessus des sens? Et qu'on ne nous dise pas que ces promesses demeurent encore en suspens, et que, comme elles s'étendent jusqu'à la fin du Monde, ce ne sera qu'à la fin du Monde que nous pourrions nous vanter d'en avoir vu l'accomplissement. Car, au contraire, ce qui s'est passé nous assure de l'avenir: tant d'anciennes prédictions si visiblement accomplies nous font voir qu'il n'y aura rien qui ne s'accomplisse, et que l'Église, contre qui l'enfer, selon la promesse du Fils de Dieu, ne peut jamais prévaloir, sera toujours subsistante jusqu'à la consommation des siècles, puisque Jésus-Christ, véritable en tout, n'a point donné d'autres bornes à sa durée. . .

'Si on ne découvre pas ici un dessein toujours soutenu et toujours suivi; si on n'y voit pas un même ordre des conseils de Dieu qui prépare dès l'origine du Monde ce qu'il achève à la fin des temps, et qui, sous divers états, mais avec une succession toujours constante, perpétue aux yeux de tout l'univers la sainte société où il veut être servi, on mérite de ne rien voir, et d'être livré à son propre endurcissement comme au plus juste et au plus rigoureux de tous les supplices.'

The Eagle of Meaux is able to carry off this travesty of the authentic Christian revelation on the wings of a magnificent style; but, when

¹ Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), p. 55. Cp. p. 48.

² Bossuet, J.-B.: *Discours sur l'Histoire Universelle*, 3rd ed. (Paris 1700), Seconde Partie, chap. xxx; Troisième Partie, chap. i; Seconde Partie, chaps xxix and xxx.

Bossuet's theme is handled by pedestrian representatives of the same Medieval school of Early Modern Western historical thought, the ridiculous bathos to which a sublime Biblical doctrine has been reduced becomes prosaically apparent.¹ Archbishop Ussher² (*vivebat* A.D. 1581–1656) makes the Medieval Western Christian *Weltanschauung* chronologically ludicrous when he mobilizes the heavy artillery of Early Modern Western scholarship to demonstrate that the date of the Creation was 4004 (*sic*, not 4000) B.C.,³ Old Style, at 6 p.m. on the evening before the 23 October;⁴ and Dr. Hartmann Schedel, the learned compiler of the Nuremberg Chronicle,⁵ makes it visually ludicrous when, between a preview of the Last Things that are to bring History to its meticulously predetermined end and the colophon of a record of already accomplished events, that he has carried down to the moment at which the manuscript was sent to the printer, he inserts three blank folios in order to give an industrious owner of the tome the necessary space, if he is willing to write on both sides of each sheet, for completing the record between the year 1493 of the Christian Era and God's fore-appointed 'D-Day' for the sounding of the Last Trump.⁶ When all due allowance has been made

Ibid., p. r.

⁵ Schedel, Hartmann: *Liber Chronicarum* (Nuremberg, 12th July, 1493, Anton Koberger).

⁶ After bringing his narrative of the *Sexta Etas Mundi* down to the moment (ka'as Junias Anno ab incarnatione salvatoris xpi Millesimo quadringentesimo nonagesimo tercio) of going to press, Dr. Schedel addresses the reader as follows in his last paragraph on the reverse side of his folio cclviii:

'Cartas aliquas sine scriptura pro sexta etate deinceps relinquere convenit. indicio posteriori ꝛ. q̄ emēdare addere. atq; gesta principum ꝛ privatorum succedentium perscribere possunt. Non em̄ omnia possumus omnes. Et quando q̄ bonus dormitat homerus. In terra em̄ aurum queritur. ꝛ de fluviorum alveis splendens profertur gloria. pactolus q̄ ditior est ceno q̄ fluente. Varii quoq; mirabiles q̄ motus in orbe in dies exoriuntur. Qui novos requirunt libros. quibus ordine referantur. Pauca tamen de ultima etate ut perfectum opus relinquatur in fine operis adjiciemus.'

The three immediately following folios, Nos. cclviii, cclx, and cclxi, are duly blank on both sides except for the page number at the head of the recto side of each of them; and these blank folios are followed in turn by an illustrated account of the *Septima etas mūdi*. This occupies folios cclxii to cclxvi inclusive, and consists of four and a half pages of

for the margin of elasticity which the use of the pen instead of the press would confer on an owner-chronicler by permitting him to contract or expand his hand-writing to fit the chronological length of the lacuna, whatever this might turn out to be,¹ Dr. Schedel can hardly be acquitted, even so, of having come impiously near to playing Providence in venturing to cast up the number of pages that would be required for completing the record of 'the times before appointed'² on the same scale as the already past and printed portion of the story. What would an earthly autocrat have said to one of his subjects who had thus presumed to indulge in public speculation on the timing of a future act of state when the intended date had been expressly docketed 'top secret'? And had not Christ rebuffed the importunate curiosity of the Apostles with the chastening words 'It is not for you to know the times or the seasons, which the Father hath put in His own power'?³

In presenting a travesty of the Christian revelation in such quaintly ridiculous caricatures as these, the Medieval-minded Early Modern Western historians were inviting decimation by a cross-fire from a Late Modern scientific dogmatism on the one flank and from a Late Modern agnostic scepticism on the other; and they are defenceless against the strictures with which their 'abstract and one-sided theocentric view' has been castigated by a post-Modern Western historian-philosopher. The Medieval historians 'fell', according to this harsh but not unmerited verdict, 'into the error of thinking that they could forecast the future', and, 'in their anxiety to detect the general plan of History, and their belief that this plan was God's and not Man's, they tended to look for the essence of History outside History itself, by looking away from Man's actions in order to detect the plan of God.'

'Consequently the actual detail of human actions became for them

narrative *De Antichristo*, *De morte ac fine rerum*, and *De extremo iudicio ac fine mundi*; a commentary in Latin verse on a half-page woodcut of the Dance of Death; and two full-page woodcuts: one of the epiphany of Antichrist and the other of the Last Judgement.

The awe-inspiring effect of this *finale* is somewhat diminished by the addition of the supplement, occupying folios cclxvii to ccc inclusive, that is advertised in the last sentence of the last paragraph on folio cclviii, quoted above; but it is plain that the learned doctor could not restrain himself from providing this unseasonable receptacle for a windfall of information about Poland and for a map of Europe.

The writer of this Study had come across a copy of Dr. Schedel's *magnum opus* at Blellach House, Dinnet, Aberdeenshire, in July 1908, and the blank folio pages had made an indelible impression on his memory; but, being then still at an unmethodical age, he had neglected to take a note of what the book containing these blank pages had been. He identified the work as the Nuremberg Chronicle on the 23rd June, 1952, when he was allowed, by the courtesy of the keepers of the New York Public Library's rare books, to inspect the second of the copies in the Library's possession.

¹ 'Sometimes a copy comes to light in which an owner did accept the challenge. Usually written in sixteenth-century hands, they record all-but-forgotten wars which were bitterly important, no doubt, to the people who wrote them. The carelessness of later binders who could not read the text and saw no point to including blank leaves in a volume, or who had, perhaps, a desire for a few sheets of fine, old, handsome paper, has cost many a copy of the Chronicle its famed three blank leaves. But in perfect copies they still remain, their white, unblemished surfaces questioning a future which has already extended nearly half a millennium beyond the time when Hartmann Schedel arranged to put them there for the accommodation of his readers' (Shaffer, Ellen: *The Nuremberg Chronicle* (Los Angeles 1950, Plantin Press, for Dawson Book Shop, Los Angeles), pp. 31-32).

² Acts xvii. 26.

³ Acts i. 7.

relatively unimportant, and they neglected that prime duty of the historian, a willingness to bestow infinite pains on discovering what actually happened. This is why mediaeval historiography is so weak in critical method. That weakness was not an accident. It did not depend on the limitation of the sources and materials at the disposal of scholars. It depended on a limitation, not of what they could do, but of what they wanted to do. They did not want an accurate and scientific study of the actual facts of History; what they wanted was an accurate and scientific study of the divine attributes, a theology . . . which should enable them to determine *a priori* what must have happened and what must be going to happen in the historical process.

'The consequence of this is that, when Mediaeval historiography is looked at from the point of view of a merely scholarly historian, the kind of historian who cares for nothing except accuracy in facts, it seems not only unsatisfactory but deliberately and repulsively wrong-headed; and the nineteenth-century [Western] historians, who did in general take a merely scholarly view of the nature of History, regarded it with extreme lack of sympathy.'¹

This hostility towards a Medieval Western *Weltanschauung* was not peculiar to a generation of latter-day Western historians whose complacent agnosticism facilely reflected the pleasant tranquillity of the places in which the lines had happened to be fallen unto them;² at a higher temperature it also animated both their epigoni and their predecessors. A twentieth-century generation of Mankind, that was tasting the extremely unpleasant experience of being driven from pillar to post by the whips of human dictators bent on putting their subjects through four-years' and five-years' plans, would have revolted, as from a chastisement of scorpions,³ against any seriously intended suggestion that a six-thousand-years' plan was being imposed on them by a dictatorial Deity. The grotesque precision with which the term of this alleged sentence of penal servitude on Mankind had been dated by the pedantry of an archbishop, who had constituted himself the self-appointed clerk of God's court, would have been the last straw on a twentieth-century camel's back if this human beast of burden had any longer taken Ussher's calculations seriously. A seventeenth-century Western Man who had had to pay for his fidelity to a Medieval *Weltanschauung* by inflicting on himself the agony of the Wars of Religion could not afford either to dismiss Bossuet's thesis, in the biting twentieth-century manner, as a bad joke or to ignore it, in the conceited nineteenth-century manner, as the negligibly irrelevant error of a securely transcended ignorance. The seventeenth-century Western intellectual rebel was defiantly up in arms, and the unacceptable words of his mouth⁴ soared, instead of condescending, when he proclaimed his resolve

To wage by force or guile eternal war,
Irreconcilable to our grand foe,
Who now triumphs, and in th' excess of joy
Sole reigning holds the tyranny of Heaven.⁵

⁵ Milton: *Paradise Lost*, Book I, ll. 121-4.

Like the Satan in whose indomitable perversity the spirit of Late Modern Western Man had been prefigured by Milton's foreboding genius, the heralds of a mundane *Aufklärung* opened their campaign by fastening upon hostages that their adversary had given to Fortune. A Bossuet who had consciously followed the lead of his Christian and Jewish masters, and had unconsciously kept in step with his Muslim contemporaries, in taking for his metaphysical pole star a 'Law of God' governing the whole Life of the Universe, had at the same time found a place in the divine economy of human affairs for 'laws of Nature' which, in Bossuet's belief, were enacted by God as by-laws and were administered by the same divine legislator and potentate to suit the exigencies of His own paramount plan. According to this view the normal cyclically recurrent regularity of these 'by-laws of Nature' could be, and duly was on occasion, interrupted by 'miraculous' acts of personal intervention not unlike those performed by the human driver of a wheeled vehicle when he puts on the brake in descending a hill or even temporarily unships the wheels from the body of the coach in order to negotiate its passage through a strait gate or over a precipitous portage.¹ The first of the new departures made by Bossuet's revolutionary-minded contemporaries was to deny that the wheels of the Universe were ever unshipped, or even braked, in this unceremoniously purposeful fashion. Without prejudice to the questions whether God existed and whether, if He were deemed to exist, He might or might not be deemed to have the same mastery over His Universe as a human coachman has over his coach, the intellectual heralds of a Late Modern Age of Western history declared with one voice that in fact there was no evidence of any deity exercising any such divine prerogative.

There was no essential difference in outlook between Late Modern Western 'deists', who took their cue from 'the Glorious Revolution' of A.D. 1688 in England and Scotland by allowing the deity still to reign on the understanding that he should no longer aspire to govern, and Late Modern Western atheists, who, taking their cue from subsequent political revolutions in North America and in France, professed to have dethroned and perhaps even decapitated a Capetian God as the necessary preface to a declaration of Nature's independence. In thus banishing God from the cosmic scene and, in the act, eliminating miracles, Late Modern Western deists and atheists joined forces to release 'the laws of Nature' from their ancient servitude to arbitrary divine checks and balances. Henceforward these 'laws of Nature' were to be free to be entirely inexorable and were consequently to be subject to becoming completely intelligible to the Collective Intellect of Man.

'Avec l'éclat du génie, Newton marque ce passage du transcendant au positif qu'un Pufendorf essayait d'opérer dans le droit, un Richard Simon

¹ 'Ce même Dieu qui a fait l'enchaînement de l'univers, et qui, tout-puissant par lui-même, a voulu, pour établir l'ordre, que les parties d'un si grand tout dépendissent les unes des autres, ce même Dieu a voulu aussi que le cours des choses humaines eût sa suite et ses proportions . . . et qu'à la réserve de certains coups extraordinaires où Dieu voulait que sa main parût toute seule, il n'est point arrivé de grand changement qui n'ait eu ses causes dans les siècles précédents.'—Bossuet, J.-B.: *Discours sur l'Histoire Universelle*, 3rd ed. (Paris 1700), Troisième Partie, chap. ii.

dans l'exégèse, un Locke dans la philosophie, un Shaftesbury dans la morale. Avec assurance, il écarte les craintes qu'on pouvait concevoir au sujet des excès d'une raison qui, pendant un temps, se concevait comme destructive. Il réalise l'union, si difficile qu'on pouvait la croire impossible, entre les exigences critiques et les faits d'expérience. L'homme repart à la conquête de l'univers.¹

(b) THE CONTEST BETWEEN SCIENCE AND ANTINOMIANISM FOR
THE POSSESSION OF AN INTELLECTUALLY DERELICT REALM
OF HUMAN AFFAIRS

The realm of Nature which a Late Modern Western Man thus claimed to call 'mine' embraced, in his acquisitive vision, the whole range of non-human phenomena, including the physical composition, structure, and working of the human body—which, in our own definitions of terms,² we have duly excluded from the domain of human affairs in adopting a usage in which the word 'human' has the connotation of meaning something spiritual. At this point, however, on his light-hearted aerial voyage, Late Modern Western Man dashed his foot against a stony paradox from which he could not be steered clear by the absent hands of evicted angels.³ The human priests of Reason, who had divested God of His divine privilege of arbitrary intervention in order to assert the counter-omnipotence of their own rival goddess, had no sooner subjected the formerly recalcitrant province of Non-Human Nature to Reason's rule than they made a second revolutionary new departure by paradoxically proclaiming another province which had hitherto been submissive to Reason's sway to be, after all, outside the bounds of her jurisdiction.

Late Modern Western minds that had risen in rebellion against the alleged arbitrariness of God now found Man usurping a prerogative that the Deity was deemed to have forfeited; for, if this was Reason's hour, it was also the power of Darkness.⁴ Even these ingeniously rational minds had not the wit to make the sovereignty of Nature effective in every nook and corner of a Universe throughout which they had now abrogated the sovereignty of God; and one of these newly created residual Alsatias which eighteenth-century Western philosophers ruefully found themselves compelled to abandon to the anarchy of Chaos and Ancient Night⁵ was the field of human history in the conventionally restricted sense of the history of those human societies that had been in process of civilization for the past few thousand years. In the vision bequeathed by Amos, Hosea, and Isaiah to Augustine, Ibn Khaldūn, and Bossuet, this episode of history had raised no insuperable moral or intellectual stumbling-block, since a faith that had been 'the evidence of things not seen'⁶ had not doubted that 'all things work together for good to them that love God, to them who are the called according to His purpose';⁷ but the Late Modern Western philosophers had now swept off the altar of Destiny a living cloth⁸ woven on a divine pattern; and, in

hastily setting themselves to cover a shockingly denuded surface with their own blue-print of 'the laws of Nature', they were disconcerted to find that this paper substitute could not be stretched, however mercilessly they might rack the scientific imagination, to extend over the particular field of events that concerned Man more than any other in virtue of its being the field in which Man's own life was at stake.

'In the eighteenth century, scientific inquiry concerned itself with what was "natural", to the exclusion of what was judged to be "unnatural", "monstrous", "accidental" and "unusual". . . . The humanists of the eighteenth century . . . assumed that the scientific study of change must have for its aim the determination of the "natural" or normal course of development of social groups, abstraction being made from the "accidental" interferences or hindrances occasioned by historical "events". . . . If we adopt this point of view . . . historical events will be conceived [of] merely as interferences with the "natural order". . . . What this mode of approach entailed was that the investigator should ignore, or rather eliminate from consideration, the intrusive influences which had interfered with the operations of the "natural order" in the course of Time. The point of view was thus arrived at which regarded historical "events" as unimportant and irrelevant for the purposes of scientific inquiry in the investigation of "progress" and of "evolution".'

The stand thus taken by eighteenth-century Western philosophers was a logical corollary of their metaphysical policy; for, when once they had placarded on the door of Nature's power-house the notice 'No admittance except on Nature's business', they had left themselves no excuse for putting up with interferences by Man in precincts where they had shut the door in the face of an interfering God. Logic constrained rational minds to give to 'historic events' the short shrift given by them to 'miracles'. Yet, logical though this eighteenth-century Western attitude might be, it was not on that account at all less quaint, and its nineteenth-century sequel was quaint; for the subsequent evolution of the film of a Late Modern Western *Weltanschauung* brought on to the screen the spectacle of nineteenth-century and twentieth-century Western historians still clinging, in the name of Science, to the eighteenth-century philosophers' tenet that History does not make sense.² The quaintness of this self-stultifying eighteenth-century-mindedness of latter-day Western historians³ lay in their apparently weather-proof imperviousness to the influences of a number of radical nineteenth-century and twentieth-

¹ Teggart, F. J.: *Theory of History* (New Haven, Conn. 1925, Yale University Press), pp. 84-87.

² The statement of this tenet had been reduced from five words to three in an epigram—'History is bunk'—that had been maliciously attributed to Mr. Henry Ford the First.

³ General statements, such as this and those that follow, about the tenets, views, and attitudes of Late Modern and post-Modern Western historians are, of course, merely descriptions of what, as the present writer saw it, was the *predominant* school of thought among them; and therefore these statements, even if they were found to be correct in the main, would never be more than approximately accurate in the sense of being all-embracing. In every generation in this age, it would be possible to point to distinguished individuals of whom these statements were not true. The purpose of the present part of this Study is to trace, analyse, and appraise the prevailing line of historical thought in a Late Modern and a post-Modern Western World, at the risk of perhaps doing some injustice to a perennially dissident minority.

century changes in the climate of thought in their own Western intellectual milieu.

The first of these changes was a revolutionary improvement in the intellectual status of the historians' own mental activity. In the eighteenth century the depreciation of History in theory for the metaphysical reasons expounded by the latter-day student of History whom we have just cited had been accompanied, as was to be expected, by a contempt for, and neglect of, the pursuit of History in practice; and the acclamation with which Gibbon's work of genius (*edebatur* A.D. 1776-88) was greeted by that great eighteenth-century historian's contemporaries was the exception that proved the eighteenth-century rule. Gibbon's contemporary fame and vogue were, however, also portents of an approaching avalanche into a new geological age; for, within twenty-five years of the publication of the last instalment of *The History of the Decline and Fall of The Roman Empire* in A.D. 1788, the valuation of History had begun to appreciate on the Western intellectual stock exchange, and thereafter the boom had been buoyed up progressively to ever higher levels until, at the time of writing mid-way through the twentieth century of the Christian Era, a school of post-Modern Western scientists, whose own prestige was then perhaps only just passing its zenith, had paid their tribute of sincere flattery to the still rising prestige of the history of human affairs by condescending to take observations of their non-human objects of study in an historical perspective.

The latter-day Western physical scientists who were thus courteously dipping their flag to latter-day Western historians of human affairs, as their ships glided past one another, were, however, at the same time slyly committing against their fellow mariners a series of acts of piracy on high seas that had been left lawless through having been released from the jurisdiction of God without having been brought within the three-mile limit of any human intellectual discipline's territorial waters.

Eighteenth-century metaphysical cartographers had partitioned the Universe on the one side into an orderly province of non-human affairs in which 'the laws of Nature' were believed to be in force, and which was therefore held to be accessible to progressive exploration by the cumulative enterprise of a Collective Human Intellect, and on the other side into a chaotic province of human history which was dogmatically declared to be intrinsically unchartable. This arbitrary division of the Apple of Life was as pretentious a gesture as the disreputable Early Modern Western Pope Alexander VI's pretension to divide the surface of one planet between the Borgia's Castilian fellow-countrymen and their Portuguese competitors; and the eighteenth-century metaphysical operation also suffered from two incurable flaws which had made Pope Alexander's cartographical bulls a dead letter. Like these, it was influenced by a human bias and, like these again, it failed to allow for the extent and configuration of still undiscovered seas and lands. The eighteenth-century Western partition of the Universe did not, in fact, account for all that therein is.¹ It did not cover the whole area of even the single province of human affairs. There were branches or aspects of

¹ Ps. cxlvi. 6.

human affairs that were left by this imperfect partition in a no-man's-land; and, in the course of a quarter of a millennium running from the date of Bossuet's death to the time of writing, stretches of this post-Bossuetan Western intellectual no-man's-land had been occupied, polder by polder, by predatory pioneers of a Late Modern Western Science and had been progressively annexed by these intellectual pirates to the domain of 'the laws of Nature'.

In embarking on these empire-building intellectual enterprises, these aggressive-minded Western civil engineers had found a base of operations long since prepared for them, and invitingly awaiting their installation, in one science of human affairs that had been inherited by these post-Christian scientists from Christian predecessors to whom this property had been bequeathed by Hellenic philosophers. In the seventeenth and eighteenth centuries, Western minds had continued, on the strength of an acquiescence in tradition which was as uncritical as it was unacknowledged, to believe that the conscious human mind was effectively governed by 'laws of thought'; Descartes himself had never dreamed of retreating from this venerably green polder on to the forbiddingly bleak metaphysical *terra firma* in its rear; and, since the Hellenes had remained unaware of their Indic contemporaries' discovery of the Subconscious, while the Franks did not begin to make their own independent discovery of this until they had been enlightened by shell-shock after their catastrophe in A.D. 1914, Science's Modern Western empire-builders in the domain of human affairs were able to benefit for more than two hundred years by a mental illusion which made the science of 'Logic' and 'the Theory of Knowledge' loom decidedly larger than Life.

From this antique base, between the opening of the nineteenth century of the Christian Era and the middle of the twentieth, Western *conquistadores* whose war-cry was the vindication of Nature's legitimate rights had already reclaimed and annexed at least four further polders from the Modern Western no-man's-land of human affairs without being challenged, or perhaps even observed, by contemporary Western historians. These newly staked-out sciences in the field of human affairs, which a Late Modern Western embodiment of the Collective Human Intellect had succeeded in adding to the orthodoxly ancient science of Logic, were Psychology, Anthropology, Political Economy, and Sociology.

In the field of Psychology—the youngest of these four new sciences of human affairs and, on a superficial view, also the least obviously open, among the four, to the charge of encroaching on the traditional domain of History—the post-Modern Western scientific mind was verifying by observation Pascal's intuition that 'the Heart has its reasons, of which the Reason has no knowledge'.¹ In the twentieth century of the Christian Era a post-Christian Western science of Psychology was beginning to explore the subconscious abyss of the Human Psyche and to discover 'laws of Nature', reigning there, which were not the laws of Logic but were laws of Poetry and Mythology.

¹ 'Le cœur a ses raisons, que la raison ne connaît point' (Pascal, B.: *Pensées*, No. 277, in the text as arranged by L. Brunschvicg). In Pascal's vocabulary, 'the Heart' includes 'intuition' as well as 'feeling'.

In the field of Anthropology, Western Science had begun, before the close of the eighteenth century,¹ to bring to light 'laws of Nature' governing the social, cultural, and spiritual life of surviving representatives of Primitive Man who were still lying torpid—after an arduous climb from a sub-human to a human level which it had taken their ancestors hundreds of thousands of years to accomplish—on a ledge from which Man in Process of Civilization had begun, within the last five to six thousand years, to make a number of attempts to climb the cliff-face above.²

The label 'Anthropology', that had been assigned to this science of human affairs in the Yin-state into which the primitive societies had latterly subsided, bore on its face the unintended yet psychologically none the less significant implication that Man could only vindicate his title to call himself human so long as he remained torpid, and that Man in Process of Civilization had divested himself of his humanity in the act of crying 'excelsior' and resuming Mankind's temporarily interrupted ascent. In reality, however, it was impracticable for the science of Anthropology to boycott the study of the civilizations, even if that had been its intention, since, long before the enterprise of Civilization had entered on its fifth or sixth millennium, the radiation of one or other of the historical civilizations that had come and gone by that time had penetrated, affected, and modified the social fabric and life of all primitive societies that had survived the impact of this formidable *parvenue* social force.³

As a consequence of these encounters with civilizations, to which the primitive societies had been exposed in the course of their latter-day sabbath rest, and through which an epilogue that was not of these primitives' own making or choosing had been added to the closed dynamic chapter of their history, it was impossible for latter-day Western anthropologists to lay hands on any pure specimens of the primitive species of human society that could be certified to be free from all social contamination by the radioactivity of some civilization or other; and the presence of this tincture of Civilization in all the primitive social fabric that was accessible to the anthropologists signified that, if the new science of Anthropology had really been successful—as, admittedly, it had been⁴—in discovering 'laws of Nature' governing the surviving semi-primitive or ex-primitive societies in the contaminated state in which these now presented themselves, a scientific method of ascertaining laws of human affairs that had thus justified itself empirically by proving to be valid in this field of ex-primitive culture would also be, to say the least, a promising line of scientific attack upon the study of societies of the species, known as civilizations, by which all the surviving primitive societies studied by the anthropologists had been contaminated in some degree. In a lull between two world wars, a pair of experienced students of surviving primitive societies had deliberately applied the technique of Anthropology to the study of contemporary life in a typical city in one

¹ The classical pioneer work in the literature of the science of Anthropology was Martin Dobritzhofer's (Dobrizhoffer's) *Historia de Abiponibus, Equestri Bellicosâque Paraquariae Natione* (Vienna 1784, de Kurzbeek, 3 vols.).

² See II. i. 192-5.

³ See II. i. 187.

⁴ See I. i. 179.

section of the North American province of a Western World;¹ but these anthropologists' dashing reconnaissance into the domain of the civilizations had been anticipated by two other expeditions organized by latter-day Western intellectual *conquistadores* who had never deigned to concern themselves with the conquest of primitive Caribs and Comanches, but had concentrated from the start, with the vaulting ambition of a Cortés or a Pizarro, on the conquest of the Mexicos and Perus.

The first of these scientific attacks on the life of Man in Process of Civilization had been made by what, at the time of writing, it had become fashionable to describe as a 'functional' approach. The eruption of Industrialism out of a social crater in Great Britain in the latter decades of the eighteenth century of the Christian Era, and the wide-spread devastation inflicted by the cataclysmic lava-flow, had produced enormities of material power, social injustice, and spiritual suffering² that had caught a horrified Frankenstein's imagination and, in moving his feelings, had spurred his collective intellect to work on the problem of ascertaining what 'laws of Nature' these might be that had thus suddenly asserted their tyrannical rule over Late Modern Western affairs. It was true that, within the century and three-quarters that had elapsed, by the time of writing, since Adam Smith's publication of *The Wealth of Nations* in A.D. 1776, the new Western science of Political Economy had hardly begun to extend its horizon beyond the spatial limits of the Western World or the chronological limits of the industrial phase of the Western Civilization's history; and this was, of course, an almost derisorily small fragment of the total history, already running to five or six millennia, of a species of society of which the Western Civilization was merely one of more than twenty known specimens. The intellectual importance of this new Modern Western science of human affairs was not, however, to be measured by the narrowness of the range of the data that it had brought within its purview so far. In a Late Modern Western World the establishment of a science of Economics had been an intellectually revolutionary event because, on one plane of social³ activity, within the limits of one society in one chapter of its history, Political Economy had translated into an accomplished reality the eighteenth-century Western philosophers' dream of bringing to light the laws governing 'the natural order'⁴ in the affairs of Man in Process of Civilization.

Moreover, the 'classical' nineteenth-century Scottish and English political economists had not been content merely to report the discovery of 'laws of Nature' in their newly reclaimed polder; they had gone on to proclaim to an awe-struck British Israel that these commandments which they had adventurously brought down from the goddess Science's holy mount were 'iron laws' of an adamantine severity; and this timely psychological substitute for the terrors of Hell had been swallowed with

² See IV. iv. 137-92.

³ In the eighteenth-century term 'Political Economy', the word 'political' had been employed to convey the meaning expressed by the word 'social' in twentieth-century Western usage.

⁴ See the passages quoted from Teggart's work on p. 183, above.

a ravenous credulity by an ex-Christian people that was suffering the discomfort of a spiritual vacuum as a consequence of the decay of its ancestral Christian religious beliefs. In the year 1952 of the Christian Era, few Western children were being kept awake at night by a fear of suddenly hearing the blast of the Last Trump, but many chronologically adult Western men and women were living in terror, night and day, of seeing 'the iron laws of Economics' inexorably ordain a catastrophic slump in which the wretched votaries of Free Enterprise would be carried off by the gleefully pouncing demons of Communism to suffer torments, predestined for the economically damned, against which there were no known means of insurance or moral rights of appeal.

After the invading Myrmidons of Science had thus triumphantly established an apparently impregnable strong-point, at the economic level, in the hitherto inviolately irrational domain of Civilization, it would have been surprising if they had not followed up this signal first success in a virgin field by breaking into a general advance at every level and all along the line. This ambitious attempt to assert the sovereignty of 'the laws of Nature' over the life of Man in Process of Civilization in all its aspects and all its dimensions had been initiated by the pioneers of a new human science that had been labelled 'Sociology', though the cause of intellectual clarity might have been served better if this department of the science of Man had been explicitly distinguished from the sociology of Primitive Man by being designated 'the Anthropology of Man in Process of Civilization'. The truth was that the two latter-day Western sciences which had come to be known by the conventional names 'Anthropology' and 'Sociology' were distinguishable from one another, not by any intrinsic difference between their respective methods and aims, but merely by a fortuitous difference between their respective objects of study. They were at one with one another in being endeavours to discover 'laws of Nature' governing Human Life.

This affinity between the sciences of Primitive Human Life and of Human Life in Process of Civilization had been tacitly but eloquently recognized in the practice of research and teaching, and this practical rapprochement between the two academic disciplines had gone so far by A.D. 1948 that in that year the opening sentences of a paper by a sociologist on 'the limitations of anthropological methods in Sociology'¹ could be conceived as follows:

'One of the more interesting of contemporary developments in the

¹ This discussion of 'the Limitations of Anthropological Methods in Sociology' by Robert Bierstedt, with a comment on Bierstedt's paper by Clyde Kluckhohn, will be found in *The American Journal of Sociology*, vol. liv, No. 1, July 1948 (Chicago 1948, University of Chicago Press), pp. 22-30. Bierstedt's thesis is summarized as follows in his own abstract of it:

'Profound differences between primitive and civilised societies restrict the efficacy of anthropological methods when applied to the latter. Among the more important of these differences are the following: (1) civilised societies are literate; (2) they have histories; (3) they are susceptible to comprehensive causal analysis in historical terms; (4) their cultural diversity and variety are incomparably great; (5) their relations with other societies are constant and pervasive in both Time and Space. Anthropological methods in general are designed to answer questions whose sociological significance is limited when the subject of inquiry is a civilised society.'

The present writer's comment on Bierstedt's thesis would be: (1) the antithesis

social sciences is the increasingly intimate relationship between Sociology and Anthropology. The influence of anthropological methods, concepts, and even theories has become so powerful in recent years that for many purposes and in many areas of investigation the two sciences have become indistinguishable. In a number of academic departments the personnel is the same; and, in the universities where separate departments are maintained, research and teaching in Social Anthropology and Sociology are characterised by ever closer cooperation.'

It might be added that, in all Western universities mid-way through the twentieth century of the Christian Era, officially established chairs of Logic, Psychology, Anthropology, Political Economy, and Sociology were to be seen 'parked' side by side with no less officially established chairs of History, without any apparent recognition of the academically awkward fact that, if the intellectual creeds of either the professors of History on the one side or the professors of the sciences of human affairs on the other side were to be taken at all seriously by the academic authorities, a decent regard for intellectual integrity would constrain them to rase from the parquet of their aula either one or the other of these two rows of professorial cathedrae. In other periods of Western history than an intellectually anarchic Late Modern and post-Modern Age, Western opinion would indeed have revolted against an intellectual inconsistency and a moral laxity of this cynical enormity; for the intellectual creeds respectively professed by the historians and by the mental and social scientists were irreconcilably contradictory; and, if either creed were ever to be canonized as a sacrosanct orthodoxy, the contrary creed would have to be anathematized in the same breath as a damnable heresy.

'literate' versus 'non-literate' is not a valid differentia between societies in process of civilization and primitive societies: we have at least one instance of a non-literate civilization, i.e. the Andean Society; (2) and (3) the 'historylessness' of primitive societies is not a valid differentia either, for they must have had a lively history once upon a time, though the record of this had been lost and though the surviving primitive societies had become static by the time when the civilizations made their first impacts on them (see the present Study, I. i. 179-80 and II. i. 192-5); (4) the cultural diversity and variety of the civilizations is not incomparably, but only comparatively, greater than that of the primitive societies; (5) the surviving primitive societies had *ex hypothesi* had relations with those civilizations that had made the records of the histories of their encounters with them, and these relations had actually been constant and pervasive in both Time and Space since an early date in the histories of the civilizations of the first generation.

In short, the likenesses between the two sciences of Sociology and Anthropology seemed to the present writer to cut deeper than the differences. On the other hand, in the present Study, in I. i. 148, 455, and 458-61, we have come across what looks like a pertinent point of difference that is not discussed in Bierstedt's paper, and that is the difference in the respective numbers of the specimens of the two species of human society that happened to be at the disposal of Western scientists in the twentieth century of the Christian Era. The sociologists had at their command perhaps no more than twenty-one specimens of their object of investigation, whereas the anthropologists had more than six hundred specimens of theirs. This numerical point of difference was not a difference between the respective methods and aims of the two sciences, and was not a difference, either, between the intrinsic natures of the two species of society that the two sciences were respectively investigating. It was a difference in the extent of the respective current facilities for studying the two species of society scientifically. In practice, this difference was assuredly an important one—even in a generation in which Archaeology had at last brought the civilizations just within the range of scientific investigation by raising the number of specimens to the still meagre figure of twenty-one.

In truth the two schools of latter-day Western scholars held quite incompatible views about the methods and aims that were necessary for intellectual salvation in the study of the affairs of Man in Process of Civilization during the last five or six thousand years; and, since in the twentieth-century phase of their long and hitherto inconclusive controversy the word 'scientific', like the word 'democratic', was a fig-leaf which no Western *savant* could discard without falling foul of a cultural watch committee, the ideological argument between Western scientists and Western historians had to be conducted, like the argument between Russian Communists and Western Old Believers, in the form of a dispute about the meaning to be attached to a word whose sacrosanctity neither party dared impugn. In the political forum the word 'democratic' meant in Russian parlance 'egalitarian' at the expense of liberty, while in Western parlance it meant 'libertarian' at the expense of equality. Neither usage ventured to discard completely either of the two explosive ideas—Equality and Liberty—which the word 'democratic' held together at high tension, but the difference in relative emphasis was a difference of degree that went so far as to be tantamount to a difference of kind for practical purposes. The no less blessed word 'scientific', which was the football in the intellectual arena, likewise held together two ideas—the idea of ascertaining the facts of Nature and the idea of inferring the laws of Nature from an unprejudiced, accurate, and exhaustive study of the facts—and here the difference of doctrine was uncompromisingly sharp.

In this twentieth-century Western intellectual disputation, the writer of this Study was aware that he himself was a combatant and not a neutral spectator; and therefore, in order to neutralize as far as possible the effect of any personal bias that might have influenced his own convictions on the subject, he preferred to refrain from attempting to expound in his own words the doctrinal point at issue, and to lay before his readers, instead, a pair of expositions—the one more favourable and the other less favourable to the thesis which was orthodox for contemporary Western historians—from the pens of two contemporary Western scholars, one of whom was an historian as well as a philosopher, while the other was an historian who had made a special study of the history of Western science.

The philosopher-champion of the historians' thesis sums up and gives judgement as follows:

'Every natural science, said the Positivists, began by ascertaining facts and then went on to discover their causal connexions. Accepting this assertion, Comte proposed that there should be a new science called Sociology, which was to begin by discovering the facts about Human Life (this being the work of the historians) and then go on to discover the causal connexions between these facts. The sociologist would thus be a kind of super-historian, raising History to the rank of a science by thinking scientifically about the same facts about which the historian thought only empirically. . . . The claims of Comtian Sociology were quietly set aside by the abler and more conscientious historians, who came to regard it as sufficient for them to discover and state the facts themselves: in the famous

words of Ranke, *wie es eigentlich gewesen*.¹ History as the knowledge of individual facts was gradually detaching itself as an autonomous study from Science as the knowledge of general laws.²

The contemporary historian-critic of the historians' thesis presents an identical picture in a different light:

'In historical science, and particularly in the upper regions of the study, a . . . policy of abstraction has become customary. Historians, limited by the kind of apparatus they use and the concrete evidence on which they must rely, restrict their realm to what we might almost call the mechanism of historical processes: the tangible factors involved in an episode, the displacements produced in human affairs by an observed event or a specific influence, even the kind of movements that can be recorded in statistics.'³

The difference, brought out in this pair of passages, between the twentieth-century Western historians' and the contemporary Western scientists' respective usages of the word 'scientific' is driven home by our historian-philosopher in the following hammer-strokes with which he batters the devoted heads of 'positivistic historians . . . who have conceived the true or highest task of History as the discovery of causal laws connecting certain constant types of historical phenomena':

'Perversions of History on these lines all share one characteristic in common, namely a distinction between two kinds of History: empirical history which merely discharges the humble office of ascertaining the facts, and philosophical or scientific history, which has the nobler task of discovering the laws connecting the facts. . . .'

At this point the philosopher-historian deals the unphilosophic historians a blow in the face with his left fist, and the scientists a blow in the face with his right:

'There is no such thing as empirical history, for the facts are not empirically present to the historian's mind: They are past events, to be apprehended not empirically but by a process of inference according to rational principles from data given or rather discovered in the light of these principles; and there is no such thing as the supposed further stage of philosophical or scientific history which discovers their causes or laws or in general explains them, because an historical fact, once genuinely ascertained, grasped by the historian's re-enactment of the agent's thought in his own mind, is already explained. For the historian there is no difference between discovering what happened and discovering why it happened.'⁴

It will be seen that this philosopher-historian's exposition of the twentieth-century Western historians' creed comes near to asserting that

⁴ Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), pp. 176-7. Cp. pp. 263-6.

the genius of History lies, not simply in 'not trying', but actually in 'trying not', to make sense of historical facts. Ignoring the consensus of sociologists, economists, psychologists, epistemologists, and logicians, whose scientific activities all alike presupposed the feasibility of studying scientifically the affairs of Man in Process of Civilization, as well as those of a *Homo Sapiens Pristinus* who was the anthropologists' target, most twentieth-century Western historians were in truth still maintaining that anyone who might venture to profess any such science of Man in Process of Civilization would be at best a heretic and at worst a charlatan.

For an interested spectator of this contest, it might be a delicate operation to declare which of the two parties was in the right, but it was not a difficult forecast to foretell which of the two, rightly or wrongly, would be approved as orthodox, and which condemned as heretical, if the case were ever to be brought before the bar of an oecumenical council of the Western Republic of Letters by some controversialist who had the courage of his convictions. It could be predicted with confidence that in that event the anathema would fall upon the historians, for it was manifest that the main line of Western thought was represented, not by them, but by the believers in the possibility of a scientific study of the affairs of Man in Process of Civilization in the sense of an attempt, in this province of Reality as in others, to discover 'laws of Nature' by inference from ascertained facts.

The fundamental faith of Western Man had always been a belief that the Universe was subject to Law and was not given over to Chaos, and a deist or atheist Late Modern Western Man's version of this Western faith was (as we have seen) that the Law of the Universe was a system of 'laws of Nature' which were accessible to progressive investigation, discovery, and formulation by a Collective Human Intellect. Grand discoveries of hitherto latent 'laws of Nature' had been the essential triumphs of a Late Modern Western Civilization's intellectual heroes: Galileo, Newton, Lavoisier, Buffon, Lamarck, Cuvier,¹ Darwin, Einstein—to cite eight of the more famous names. Who would presume to draw a line beyond which these intellectual *conquistadores* must not extend their operations, or, in other words, presume to confine the jurisdiction of 'the laws of Nature' within some conventional limit? A proclamation that one province of the Universe—and this the metropolitan province occupied by Man in Process of Civilization—had been reserved once for all, by some undesignated higher authority, as a sanctuary for Chaos which was to be for ever immune from the jurisdiction of all law, natural or divine, would be odious treason and horrible blasphemy in the judgement of all scientifically *bien pensants* twentieth-century minds; and, if

¹ Any reader of Herbert Butterfield's *The Origins of Modern Science, 1300-1800* (London 1949, Bell) will observe that, in the notices of the work of these first six heroes on pp. 61, 125, 186, 203, 207, and 208-9, there is a common feature which in every case is the hero's essential feat. In every case his life-work is the vindication of the reign of 'laws of Nature' in provinces of Reality in which the evidences of Nature's jurisdiction had hitherto been invisible to Mankind's mental vision. While some of these six men of scientific genius did also distinguish themselves by ascertaining or verifying facts, they were famous, not for this, but for 'the discovery of causal laws, connecting certain constant types of . . . phenomena', which, in the province of historical phenomena, was, as we have seen, an illegitimate activity in the eyes of twentieth-century Western historians.

ever the antinomian historians were to be 'put on the spot', an explicit public confession of their shocking atavistic eighteenth-century belief that the life of Man in Process of Civilization was 'a tale told by an idiot, signifying nothing',¹ would inevitably provoke a conviction on the charge of heresy and a sentence to whatever punishment might await a convicted heretic in a post-Modern Western World in which the Late Modern Western virtue of tolerance had fallen back several degrees below an eighteenth-century standard of 'politeness'.

It could be predicted with no less confidence that, if, in our imaginary oecumenical council, some trick of oratory or freak of fortune were to win a majority of the votes for the antinomian historians, the sociologists on whom the tables would then be turned would be no less rightly combustible heretics according to the verdict of an historian-inquisitor. Indeed, if the historians had not yet asked for trouble by taking the offensive against the social scientists and denouncing them on the very charge of heresy that was hanging over the historians' own heads, this tactful tolerance of theirs seemed to be the genial product of an infinite capacity, not for holding their own passions in check, but for ignoring their aggressive adversaries' existence. Mid-way through the twentieth century of the Christian Era, most Western historians seemed still to be contriving to turn as blind an eye to the social scientists' successive trespasses on the historians' pointedly placarded preserve as a Neville Chamberlain had turned in A.D. 1938 to the Third Reich's successive aggressions in the Western World's political arena. In an era of appeasement the historians were allowing the economists to rob the Antinomian World of an Austria, and the sociologists to rob it of a Czechoslovakia, from under the Antinomians' very eyes, without betraying, by even the flicker of an eyelid, any consciousness of these impudent depredations that were being committed at the historians' expense.

One day in the winter of A.D. 1949-50, when the writer of this Study, with the present chapter in mind, was meditating in his native city of London on this strange comedy that was being played within his sight on a contemporary human stage, his legs carried him to the brink of the Round Pond in Kensington Gardens to enjoy a spectacle of which he had never grown tired since the abnormally severe weather in the early months of the year A.D. 1894 had taught the sea-gulls bred in the provinces and abroad to spend their winters in the London parks as the uninvited but pampered guests of the human inhabitants of the metropolis. While he was listening, on this particular afternoon, to the familiar screaming of the excited gulls, as they wheeled and dived, like fighter planes, and jostled with one another to catch in the air the morsels of bread that their human benefactors were, as usual, tossing to them, his eye was caught by the comically 'know-nothing' air of the domesticated ducks, officially domiciled in the Royal Parks and Gardens, who were placidly riding on the water just below the scene of the gulls' frantic aerial manœuvres. 'Too proud to fight',² these lawful denizens of the

¹ Shakspeare: *Macbeth*, Act. V, scene v.

² 'There is such a thing as a man being too proud to fight' (President Woodrow Wilson at Philadelphia on the 10th May, 1915).

pond were saving their face by pretending not to notice how aggressively the boisterous trespassers were behaving. Even when one of the rare crusts that fell into the water without having been intercepted by a gull's beak in its short aerial trajectory was snatched from right under the beak of a lazily floating duck by one of the swooping screeching marauders, the insulted duck, as it bobbed up and down on the wavelets that the gull's swoop had rudely raised, betrayed no sign of awareness that any irregularity was being committed. When the writer heard his wife's voice asking him, in a tone of amused surprise, why he had suddenly burst out laughing, he realized that this comic encounter between ducks and gulls on the Round Pond in Kensington Gardens had moved him to mirth by presenting itself to his imagination as an animated allegory of a drolly similar encounter between historians and social scientists.

(c) THE UNCONSCIOUS CREDULITY OF PROFESSED AGNOSTICS

Did those historians who, duck-like, ignored the gull-like scientists' predatory descents on the historians' preserve live up, in real life, to their own antinomial interpretation of the sacred word 'scientific'? The answers to this question would appear to be that they did not translate their profession of faith into practice and that they failed because the ideal which they had set themselves was impracticable *a priori*; but, in finding the answers to one question, we shall have confronted ourselves with another; and that is the deeper question why a majority of this particular generation of historians in this particular social milieu should ever have taken their antinomial stand at all.

An ironic feature of the latter-day Western historians' failure to honour their own antinomial principles was their unawareness that they were refuting their professions by their practice.

'The men of a given generation are generally unaware of the degree to which they envisage their contemporary history within an assumed framework, ranging events into certain shapes or running them into certain moulds which are sometimes adopted almost as in a day-dream. They may be sublimely unconscious of the way their minds are constricted by their routine formulation of the story; and only when the World is different, and there emerges a new generation not locked from birth in the accepted framework, does the narrowness of that framework become apparent to everybody. . . . It is a mistake for writers of history and other teachers to imagine that if they are not Christian they are refraining from committing themselves, or working without any doctrine at all, discussing History without any presuppositions. Amongst historians, as in other fields, the blindest of all the blind are those who are unable to examine their own presuppositions, and blithely imagine therefore that they do not possess any.'¹

This tragi-comic figure of the prisoner who pronounces himself free because he is unconscious of his chains has crossed our path once already. In an earlier context we have quoted a profession of unbelief

¹ Butterfield, Herbert: *Christianity and History* (London 1949, Bell), pp. 140 and 46.

which its distinguished author manifestly felt to be an effective declaration of intellectual independence:

'One intellectual excitement has . . . been denied me. Men wiser and more learned than I have discerned in History a plot, a rhythm, a pre-determined pattern. These harmonies are concealed from me. I can see only one emergency following upon another as wave follows upon wave; only one great fact with respect to which, since it is unique, there can be no generalisations; only one safe rule for the historian: that he should recognise in the development of human destinies the play of the contingent and the unforeseen.'¹

This declaration had become a *locus classicus* within seventeen years of the date of its publication;² yet, before it was published, it had already been put out of court by its author's choice of his title for the book in which this prefatory passage was intended to strike the key-note. An historian who had thus publicly declared his allegiance to the dogma that 'Life is just one damned thing after another' might have been expected to give his work some such conformably non-committal title as 'A History of Some Emergencies in Some Human Affairs'; but, in calling it, as he did, 'A History of Europe', he was recanting in his title his own denial in his preface that he had 'discerned in History a plot, a rhythm, a pre-determined pattern'; for the portmanteau word³ 'Europe' is a whole *Corpus Juris Naturae* in itself.

In writing into his title this one word 'Europe', the historian was compromising himself inextricably by subscribing implicitly to at least thirty-nine articles of a submerged Western *religio historici*.

Article One of this traditional Act of Faith is an endorsement of a glaring pattern of cultural geography in which the *Oikoumenê* is dismembered, by a Procrustean operation, into fragments labelled 'Europe' and the rest of 'the continents'.⁴ Article Two is an act of homage to an egocentric illusion which was shared by the children of a Western Society with the children of all other societies known to History, and which had misled them all into the identical, and therefore in every case incongruous, assumption that each society's own culture was 'Civilization' with a capital 'C'.⁵ Article Three is the detection of a plot in which the emergencies that follow 'upon one another as wave follows upon

¹ Fisher, H. A. L.: *A History of Europe* (London 1935, Eyre & Spottiswoode, 3 vols.), vol. i, p. vii, quoted in the present Study, V. v. 414.

² The brilliance with which, in this passage, the *Weltanschauung* of an antinomian school of Late Modern Western historians is propounded by a master of the art of History, and the force of the impression made on the minds of contemporaries by so challenging an exposition of a sharply controversial thesis by an eminent authority, were the considerations that moved the present writer at this point in his argument to illustrate his theme by citing an historian of an older generation for whom he felt an abiding professional respect and personal regard. Herbert Fisher's kindness to him as a young man had been one of the happy circumstances in his life, and one of the milestones in his education had been *Napoleonic Statesmanship in Germany*. His *History of Europe* was a masterpiece in the practice of the delicate art of . . .

³ 'You see, it's like a portmanteau—there are two meanings packed up into one word' (Humpty Dumpty in *Alice Through the Looking Glass*, by Lewis Carroll).

⁴ A critique of this traditional pattern of cultural geography will be found in IX. viii. 708–29. For the purposes of the present argument, it makes no difference whether this pattern is, or is not, a reflection of historical realities.

⁵ This egocentric illusion had been examined in I. i. 157–64.

wave' wash up the historian's own culture, country, and clan on to a pinnacle on which History finds its denouement and its consummation.¹ Article Four is a no longer avowed, yet none the less patently implied, ascription of this plot of Human Destiny to a divine playwright and stage-manager who, by a sovereign act of predetermination, has selected the historian's tribe to be God's own Chosen People. Article Five is the Christian doctrine that God's choice has been transferred from Israel to the Christian Church. Article Six is the Medieval Western Christian dogma that the truly orthodox Christian Church is not the canonically Orthodox Church but the Western (notwithstanding any play that a Photius may make with the *filiouque*). Article Seven is the Late Modern Western postulate that the mantle of a Medieval Western Christendom has fallen upon the shoulders of an ex-Christian Modern Western Society by the divine oversight of a God who has now ceased to govern and perhaps even ceased to reign. Article Eight is the equation of this de-consecrated shadow of a defunct Western Christendom with the imaginary cultural continent already labelled 'Europe'. Article Nine is a parrot cry that was being refuted by fresh strokes of the anthropologist's pencil and the orientalist's pen and the archaeologist's spade as often as it was being repeated by the tongues of Western historians. Its burden was that 'Europe' was distinguished alike from an 'Unchanging East'² and from primitive 'peoples that have no history'³ by being History's only possible subject; and it will be seen that this slogan was an assertion that the only possible history was the history of Europe because European affairs alone had a rhythm.

A citation of the remaining thirty articles of religion that still lie packed in an expanding Pandora's Box labelled 'Europe' might tax the reader's patience without being strictly necessary for clinching the present argument. On the strength of Articles I-IX, as these have been recited above, we may perhaps take it as having been already demonstrated that an historian's professed inability to discern in History any plot, rhythm, or predetermined pattern is no evidence that blind Samson has actually won his boasted freedom from the bondage of 'laws of Nature'. The presumption is, indeed, the opposite; for, when bonds are imperceptible to the wearer of them, they are likely to prove more difficult to shake off than when they betray their presence and reveal something of their shape and texture by clanking and galling.

It is, no doubt, also true that, even when a thinker is salutarily aware of an intellectual pattern in his mind, this awareness is not in itself any guarantee that he will be able to get rid even of the particular pattern that is obsessing him, not to speak of his finding himself able to dispense with intellectual pattern-making altogether. Yet, short of that, Man's consciousness is likely to prove itself Man's guardian angel in this pass as in others; for, in so far as he manages to bring one of these patterns within

¹ This misconception of the process of growth as being a movement in a straight line culminating in the historian's own time and place has been examined in I. i. 168-71.

² The catchword of 'the Unchanging East' has been dissected in this Study in I. i. 164-8.

³ The grounds for rejecting this opprobrious label as a misnomer have been examined in I. i. 179-80.

the focus of consciousness, he is winning for himself at least a chance of managing to discern whether this image in his mind is a reflection of Reality or a baseless hallucination; and, even if he finds that he cannot think at all except on the lines of some pattern or other, he will at any rate have an opportunity, in the light of consciousness, of sorting his intellectual stock, comparing one pattern with another, discarding the patterns that seem to him counterfeit, and retaining those that seem to him true copies of 'laws of Nature'. By contrast, when a thinker can boast that, whether wilfully or by act of God (in an insurance company's usage of that phrase), he is unconscious of any plot, rhythm, or pattern in his panorama of the Universe, he is telling us in effect that he is at the mercy of whatever pattern, rhythm, or plot may be in invisible occupation of his professedly empty, swept, and garnished¹ mental house. This occupying pattern may be so archaic, infantile, crude, and far-fetched that, if the occupied mind ever could or would look its masked master-ideology in the face, it would be horrified to see itself in bondage to an ape, child, Caliban, or Chimaera.² Yet, so long as this master is able to rule the blind soul by an invisible *acte de présence*, just so long will the soul—like 'a horseman borne afar, who never sees the horse beneath his thigh'³—remain impotent either to exchange this unworthy pattern for a better or to redeem it by refining it in the crucibles of reflection and self-criticism.

The figure of the typical antinomian latter-day Western historian, caught fast in bondage to an invisible pattern whose dominion over him was secure just because he believed himself to be proof against ever entertaining any such idea, was, of course, a living witness to a relativity of historical thought that was the looking-glass through which we forced our entry into the vista of our present Study.⁴ This captive mammoth was a unique twentieth-century relic of a now old-fashioned-looking Western intellectual fauna which, save for this single surviving representative, had become extinct because its *habitus* had been too nicely adapted by the goddess Natural Selection to the temporary exigencies of an eighteenth-century Western intellectual environment. The eighteenth-century dogma, still cherished by so many twentieth-century Western historians, that no sense was to be made of human affairs, had been gradually whittled away, as we have seen, by the progressive encroachments of Science during the intervening quarter of a millennium. Yet Science's overt conquests at the expense of a would-be antinomian school of historians were not so damaging to this school's thesis as its own subconscious thralldom to mental patterns that displayed the tell-tale imprint of a particular time and place.

This relativity of an unacknowledged pattern of thought, which was so conspicuous, and so crippling, an infirmity of eighteenth-century-

¹ Matt. xii. 44; Luke xi. 25.

² 'The danger of subconscious and primitive theorising should not require further argument. Our choice is not between theory and no theory but between workmanlike theory and theory that is not workmanlike' (Schumpeter, J. A.: *Business Cycles* (New York 1939, McGraw-Hill, 2 vols.), vol. i, p. 32, n. 1).

³ Jalāl-ad-Dīn Rūmī: *Mathnawī*, Book I, ll. 1109 seqq., translated by Nicholson, R. A., in *Rūmī, Poet and Mystic* (London 1950, Allen & Unwin), p. 106.

⁴ See I. i. 1-16.

minded twentieth-century historians had been adroitly turned to account by a spirited historian-philosopher in an attempt to vindicate the historians' antediluvian Antinomianism by casting discredit on their *bête noire* in the shape of 'laws of Nature' in the affairs of Man in Process of Civilization.

'So-called sciences of the Human Mind, whether total or partial (I refer to such studies as those on the Theory of Knowledge, of Morals, of Politics, of Economics, and so forth). . . are designed as accounts of one unchanging subject-matter, the Mind of Man as it always has been and always will be. . . .

'This assumption is present . . . in Montesquieu, but it also lies at the back of all the philosophical work of the eighteenth century, not to mention earlier periods. The Cartesian innate ideas are the ways of thinking which are natural to the Human Mind as such, everywhere and always. The Lockian human understanding is something assumed to be everywhere the same, though imperfectly developed in children, idiots, and savages. The Kantian mind which, as Intuition, is the source of Space and Time, as Understanding the source of the Categories, and as Reason the source of the ideas of God, Freedom, and Immortality, is a purely human mind, but Kant unquestioningly assumes it to be the only kind of human mind that exists or ever has existed. Even so sceptical a thinker as Hume accepts this assumption. . . . Hume never shows the slightest suspicion that the Human Nature [which] he is analysing in his philosophical work is the nature of a Western European in the early eighteenth century, and that the very same enterprise, if undertaken at a widely different time or place, might have yielded widely different results. He always assumes that *our* reasoning faculty, *our* tastes and sentiments, and so forth, are something perfectly uniform and invariable, underlying and conditioning all historical changes. . . .

'A positive science of Mind will, no doubt, be able to establish uniformities and recurrences, but it can have no guarantee that the laws [which] it establishes will hold good beyond the historical period from which its facts are drawn. Such a science (as we have lately been taught with regard to what is called Classical Economics) can do no more than describe in a general way certain characteristics of the historical age in which it is constructed. If it tries to overcome this limitation by drawing on a wider field, relying on Ancient History, Modern Anthropology, and so on, for a larger basis of facts, it will still never be more than a generalised description of certain phases in Human History. It will never be a non-historical Science of Mind. . . .

'Little acquaintance with [so-called sciences of the Human Mind] is demanded in order to see that they are nothing of the sort, but only inventories of the wealth achieved by the Human Mind at a certain stage in its history. The *Republic* of Plato is an account, not of the unchanging ideal of political life, but of the Greek ideal as Plato received it and re-interpreted it. The *Ethics* of Aristotle describes, not an eternal morality, but the morality of the Greek gentleman. Hobbes's *Leviathan* expounds the political ideas of seventeenth-century absolutism in their English form. Kant's ethical theory expresses the moral convictions of German pietism; his *Critique of Pure Reason* analyses the conceptions and principles of Newtonian science in their relation to the philosophical problems of the day.'¹

¹ Collingwood, R. G.: *The Idea of History* (Oxford 1946, Clarendon Press), pp. 229, 82-83, 223-4, 229.

All this is both true and well said, and we may observe in parenthesis that it is as pertinent a critique of the work of professedly antinomian historians as it is of attempts to discern 'laws of Nature' governing human affairs. A Chinese antinomian confrère and contemporary of the Western antinomian historian Herbert Fisher would have labelled his book, not 'A History of Europe', but 'A History of the Middle Kingdom'.¹ Yet a diversity of inscriptions on title-pages, which would thus illustrate the relativity of antinomian historians' outlooks to their own social milieux, would also testify, in the same breath, to the uniformity of antinomian historians' delusions about the workings of their own minds; for these two diverse titles are, both alike, specifications of patterns in the affairs of Man in Process of Civilization, and, in thus committing himself on his title-page to a pattern, whatever the pattern may be, either historian will have 'escaped his own notice' (to enlist an Ancient Greek turn of phrase) in making a public recantation of his boasted inability to discern in History any pattern, rhythm, or plot. Nor could our Chinese or Western historian-sceptic succeed in salvaging his scepticism by describing his work expressly as being 'A History without a Pattern'; for, supposing that this vaunted 'patternlessness' could be genuinely conceived of and that the idea could then be successfully put into execution, the result could be nothing but just one pattern the more. In this light we can see that Collingwood's act of sceptical faith in taking the shimmer of relativity in the foreground of historical thought² at its face value cannot be the last word; and indeed every sceptic who has the honesty to be thoroughgoing brings his negations tumbling to the ground by sawing clean through the branch on which the sceptic-sawyer is perching.

Overrunning the combative philosopher's échelon of advanced positions in the successive zones of Economics, Politics, and Morals without lingering, at this stage, to mop them up, let us now press our counter-offensive home into the zone of the Theory of Knowledge, which is Scepticism's last ditch where it will decisively stand or fall; and, in conducting this operation, let us take a leaf out of the tactical note-book of a nameless genius who, according to an amusing legend, once initiated his mates into the secret of how to win 'hands down' in a contest over some long since forgotten issue between the employees on the Italian State Railways and the Ministry of Communications at Rome.

When the leaders of the aggrieved *ferrovii* were nervously debating whether they should take the risk of depleting their trade-union funds, and perhaps even falling foul of the law, by instructing their followers to strike work, one ingenious mind suggested an alternative course of action that would be certain to bring the railwaymen's adversaries to their knees without putting the workers in the wrong or even costing them a penny. 'Instead of going on strike', he suggested, 'let us simply carry out the official regulations'; and this elegant solution of the railwaymen's problem had only to be propounded in order to be accepted, *nemine contradicente*, as the unquestionably advantageous line

¹ See the rescript, cited in I. i. 161, which was addressed in A.D. 1793 by the Oecumenical Emperor Ch'ien Lung to the parochial princeling *in partibus barbaricis*, George III of Britain.

² See I. i. 16.

of tactics to pursue. Its elegance lay in the fact—too familiar to have registered itself in any ordinary railwayman's consciousness—that the continued operation of the Italian State Railways was dependent on the continued observance of a tacit 'gentleman's agreement' between the employees and the authorities that the regulations officially in force were to be tactfully ignored. So, by simply carrying out their legal duties for once in a way, the railwaymen could instantaneously bring the traffic on the railways to a standstill without either forfeiting their pay or rendering themselves liable to prosecution. No sooner said than done. When the moment arrived for the morning express train to leave Milan for Rome, and the guard duly blew his whistle, the driver correctly waited to hear the same blast twice repeated at intervals of fifteen minutes; and, when the train then did get under way, the driver, correctly again, accommodated the train's speed to the walking-pace of a colleague who was likewise correctly carrying out the regulations by advancing, ten paces ahead of the buffers of the locomotive, waving a red flag held in his right hand to ensure the safety of the public while he was tapping the rails with a hammer held in his left hand to ensure the safety of the passengers. This sly 'cold war' could have only one outcome, and the end came quickly. On receipt of a telegraphic report from the station-master at Milan, the Ministry at Rome announced its unconditional surrender.

Translating the Italian railwaymen's tactics from an economic to an intellectual arena, let us now try the effect of taking Fisher's dictum 'There can be no generalizations'¹ *au pied de la lettre*. We can perhaps now still legitimately utter the word 'battle' in recording the battle of Megiddo (*commisum circa* 1468 B.C.); but, now that we are conscientiously abiding by the regulation that 'History never repeats itself', we must, of course, find some other word to describe what happened at Marathon, and some other again to describe what happened at Waterloo; and, when we have shot all the bolts in our most copious dictionary of synonyms (though, strictly speaking, we shall be guilty of 'not playing the game' if we stoop to any such verbal subterfuge), we shall find ourselves constrained to keep silence for ever after on the subject of the affairs of *Homo Belligerans*. We can also perhaps now still legitimately pronounce the words 'Pope John I'; yet all the known synonyms of that ilk—'pontiff', 'prelate', 'primate', 'hierophant', 'Grand Lama', 'Möbadh-ân Möbadh', and what-not—will hardly legitimize for us the twenty-two (or is it twenty-three?) repetitions that are obstinately demanded of us *sub rosa* by a History that officially declines to repeat itself. But our plight is perhaps more serious than we have yet realized, for, if 'History never repeats itself', one single 'John' is the only 'John' whom it is permissible for us to name; and, though we may dishonestly eke out this iron ration by buying 'Jack', 'Jean', 'Euan', 'Evan', 'Ivan', 'Johann', and 'Yohanan' in a philological black market, famine will still be lying in wait for us round the corner when we are left with no unappropriated homonym for affixing to the next man in the queue. But what are we saying? For Adam, now that we think of it, was a man, and, since 'His-

¹ See the passage quoted on p. 195, above.

tory does not repeat itself', our common father must have been the last man as well as the first, without prejudice to the question of how we are to refer to Adam's children. At this point speech and thought alike fail us. We have effectively inhibited ourselves from thinking or writing either about History or about anything else; and, if the philosopher-historian who has ruled out 'uniformities and recurrences' from the realm of Reality¹ wishes to be given quarter, he had better now make up his mind to capitulate with the promptness that, according to the legend, was once the only salvation of the Italian Ministry of Communications.

The truth which confounds an honestly consistent sceptic is that the Human Intellect is so constituted as to be intrinsically incapable of ever thinking about anything at all except in terms of uniformities, recurrences, regularities, laws, rhythms, plots, and patterns of other kinds, while, conversely, of course, none of these patterns is conceivable as being anything but an arrangement of facts.

'The theories with which Science works cannot be conceived as existing apart from the facts of human experience, and men can apprehend facts only in terms of the notions with which their minds are furnished. . . . In scientific work these two blends, knowledge of fact and theoretical conceptions, keep stimulating, extending, and enriching each other. An investigator who starts with what purports to be an exposition of theory is tacitly using the facts by which the ideas have been moulded; and one who starts with what purports to be an exposition of facts is tacitly using the theoretical conceptions by which facts have been apprehended.'²

Thus *Homo Sapiens* is confined *a priori* to a choice between two alternative conclusions, and these two only, when he is confronted with the ultimately inescapable necessity of making up his mind about the credentials of his own mental patterns. Either we must conclude that, in so far as we do apparently manage to think about something, the pattern that we register in performing any act of thought is a pattern that is genuinely present in Reality, or else we must conclude that the pattern registered in our minds is an illusion and that, in other words, our thoughts are not reflections of 'things' but are mental figments without counterparts in any reality distinguishable from our consciousness. In this dilemma a sceptic who has the courage of his convictions must either retire from the field or else change sides; and, when it comes to the point, he will find that, for a philosopher, desertion, not withdrawal, is the honourable course because it is the only logical one; for, in acknowledging that he is a sceptic, our adversary has proclaimed that he is a thinker and has committed himself in the act, by an involuntary re-affirmation of a celebrated proposition of Descartes', to a declaration of faith in the archetype-pattern, 'I am'.³

(d) THE GROUNDS OF THE LATE MODERN WESTERN HISTORIANS' AGNOSTICISM

The antinomian latter-day Western historians' dogma that the history of Man in Process of Civilization is an unintelligibly chaotic congeries of brute facts thus proves to be a heresy from the standpoint, not merely of Western science, but of Human Thought itself; and this spectacle of 'the laws of Nature' standing entrenched and embedded in the very structure of Man's intellect forces us to ask ourselves what can have possessed any—even antediluvian—breed of Man to make him nail these heretical colours to his mast. The antinomian historians' response to the challenge of a decisive change of intellectual climate in their cultural environment was not merely reactionary but truculent. So far from seeking to earn an erasure of the stigma with which they had been branded by eighteenth-century Western philosophers,¹ they retorted by telling the world that 'their glory' was 'in their shame'.² Their response to the challenge of outlawry was to proclaim themselves to be the Antinomians that they were. Constituting themselves the grand jury in their own case, they found that the charge indicting them of making nonsense of History was a true bill, and then, proceeding to constitute themselves, in turn, the jury, they acquitted themselves with a self-indulgent verdict of 'not guilty', on the plea that to be convicted of making nonsense was as good as to be warranted 'scientific'.

On this point our comparison of the historians with the ducks in the Round Pond will hardly help us out; for the ducks, as we have seen, were not truculent; they were supine; and, in proudly refraining from fighting with the vagrant gulls for the crusts that were tossed to the birds by the general public, the ducks were rationally discounting in advance a never yet disappointed expectation that the subsistence allowance, annually voted to them by a benevolent Parliament, would continue to be issued to them by a dutiful Ministry of Works. By contrast, the historians had no such comfortable assurance that, if they allowed the affairs of Man in Process of Civilization to be snatched from under their noses, morsel by morsel, by their predatory rivals the social scientists, any providence, human or divine, was going to dish out to them any alternative means of subsistence. Indeed, on any rational calculation the chances were that, on the contrary, the historians' policy of non-violent non-co-operation with the social scientists' depredations at their expense would result in leaving them destitute. Thus for the historians, unlike the ducks, the attitude of being 'too proud to fight' was a luxury that they could not afford; yet, nevertheless, they were indulging in it. Like the ducks, they were refusing to scramble for bread falling like manna from Heaven. They were declining to defend their own birthright by taking a leaf out of their rivals' book. What had prompted these latter-day Western historians to play this foolhardily dangerous game of challenging the validity of the ineluctable laws of thought by refusing to entertain the contemporary Western scientists' hypothesis that there were 'laws of Nature' governing the history of Man in Process of Civilization? They

¹ See Teggart, in the passages quoted on p. 183, above.

² Phil. iii. 19.

would hardly thus have followed the Pharisees' forbidding example of passing sentence of ostracism on themselves¹ if they, in their turn, had not been moved by Pharisaically compulsive motives. Can we account for the idiosyncrasy of these antinomian historians by laying bare its intellectual grounds?

One argument that was sometimes propounded by latter-day Western historians to prove the impracticability of applying to human affairs those methods by which non-human affairs had been successfully brought under the jurisdiction of laws of Nature was to point out that, in the study of human affairs, hypotheses could not be verified by mounting 'controlled' experiments, since in real life, in sharp contrast to the utopian conditions of an Huxleian *Brave New World*, Man had never yet been conditioned to the amenability of a guinea-pig, but was still exhibiting all the contrariness of a most recalcitrantly wild animal.² This observation was, of course, correct, but the agnostic conclusion drawn from it was put out of court by the following considerations. In the first place a human wild animal that was fiercely refractory to the personal wills of other representatives of its kind might at the same time turn out to be tamely submissive to the impersonal yoke of custom and impressionably amenable to spells cast upon the conscious personality by both a personal and an impersonal layer of a subconscious psychic underworld. The second weakness of the argument was the postulate that a 'law of Nature' could never properly be certified as having been duly ascertained unless it had been verified by experiments arranged and executed so as to insulate the particular phenomena in which the regularities and recurrences constituting this hypothetical pattern, rhythm, plot, or law were alleged to reveal themselves. The acceptance of this postulate would have entailed the disfranchisement of a number of sciences which had been recognized, by the general consensus of a Collective Human Intellect, to have won a legitimate title to the name by having put their finger on systems of 'laws of Nature' that were generally admitted to be valid.

Since Primitive Man was no more amenable to being made a victim of controlled experiments than was Man in Process of Civilization, the science of Anthropology would have been the first to lose its franchise on the postulated test; and no doubt the historians would not have been sorry to find this opportunity of disallowing retrospectively a title to which they had implicitly given a grudging recognition by maintaining a disapprobatory silence. Fortunately, however, for the vulnerably human science of Anthropology, the impeccably inhuman science of Astronomy happened to be in the same boat. The courses of the stars³ were no more amenable to the test of controlled experiments⁴ than were the tides in the affairs of men;⁵ and Astronomy and Anthropology must therefore either sink or swim together—sharing the same watery grave if an ability to insist on registering its subjects' finger-prints was to be taken as the

¹ For the common use of the word 'Pharisees', see V. v. 73, with n. 4.

⁵ Shakespeare: *Julius Caesar*, Act IV, scene iii, l. 217.

crucial test of a science's respectability, and riding the storm hand in hand if this proposed test was to be dismissed as an imposition that was invidious and unnecessary. In these circumstances it was manifest that Astronomy and Anthropology alike would retain, and not forfeit, their titles to being recognized as full-blooded sciences, since it was manifest that, if common sense were confronted with the choice of having to throw overboard either Astronomy's claim to be a science or the historians' forensic insistence on the indispensability of controlled experiments, then common sense would salvage Astronomy at the price of jettisoning the requirement that *soi-disants* 'laws of Nature' must have been verified by controlled experiments in order to qualify for being promulgated as the findings of a science. Astronomy was not only perhaps the oldest of all the sciences; she had also continued to retain her place of honour even in an age that had seen the sinister rise of a parvenu Atomic Physics; and this persistent and unabated brilliance of a venerable science in which the method of controlled experiment was inapplicable in the nature of the case was a practical vindication of the thesis that, in the study of phenomena, non-human and human alike, observation, unverified by experiment, was after all capable of effectively ascertaining 'laws of Nature'.

This question of principle, however, probably counted for much less among the considerations inclining a latter-day school of Western historians towards Antinomianism than the question whether the ascertainment of 'laws of Nature' in the affairs of Man in Process of Civilization was feasible in practice under the conditions with which these historians were confronted by the quantity of the data with which they had to deal. It was arguable that this quantity was too great, and also arguable that it was too small; and both these mutually exclusive arguments were used by different sects of contemporary Western historians who were all of the antinomian persuasion. Since those who argued that the data on the table were too numerous to be made to make sense appeared to be in a large majority over their confrères who arrived at an equally agnostic conclusion for the opposite reason, it will be convenient to examine this plea that the quantity of data was disablingly abundant before considering the alternative plea that it was disablingly scanty.

Since the eighteenth century of the Christian Era, when the Modern Western historians had incurred the censure of the Modern Western philosophers, the historians had in truth vastly increased the quantity of data within their purview by raking in enormous masses of them from two previously unexploited rubbish-heaps. On the one hand they had opened up the archives of Western public institutions such as the Papal Curia and the governments, central and local, of the Western World's parochial states; and on the other hand they had brought within their horizon the ordinary affairs of private people who had left their trails in the archives of firms and families. If the historians had been concerned to erase the stigma with which the philosophers had branded them, they would have noticed that, for the purpose of an apologia, their two simultaneous paper-chases were not equally promising.

The gravamen of the philosophers' indictment had been that the

historians neglected what was susceptible of scientific study in order to attend exclusively to events that interfered with 'the natural order' by being 'unnatural', 'monstrous', 'accidental', and 'unusual';¹ and the sting of truth in this charge had been retrospectively pressed home under the historians' thin skin by the witty authors of *1066 and All That*² in their parody of a presentation of History which had actually once held the field. In dissociating themselves from History as it was being written by Western historians in the eighteenth century, the Western philosophers of that age had in effect been praying to be delivered 'from battle and murder and from sudden death' (in the words of the Litany in *The Book of Common Prayer* according to the use of the Church of England). Sudden death, murder, and battle, however, were the dominant theme not only of a pre-Rankean Western historiography but likewise of the documents that the nineteenth-century Western historians had been extracting from Western public archives; and the 'unnaturalness' and 'monstrousness' of this 'penny dreadful', 'Sunday paper' streak in human affairs were not mitigated by bringing the stuff out of the wholesalers' warehouses in bulk and retailing it to the public in an infinite number of infinitesimally small samples.

On the other hand the nineteenth-century historians were genuinely breaking new ground—and thereby effectively converting their shame into glory—when they broke their way out of the madhouse of sensational public events, in which their predecessors had been 'cabined, cribbed, confined, bound in'³ by a conventional limitation of the usage of the word 'historic', and thereby won for themselves the freedom of the great open spaces of private life, in which ordinary people demonstrated daily to intellectual sight-seers that, when the human animal was given the run of a Yellowstone Park, he could wear a less repulsive countenance than he was condemned to exhibit in his public life, where he had to live under the pathological slum conditions of the zoological gardens in a metropolis. In claiming for History this wholesomely spacious parkland of private life, the historians were legitimately appropriating for their own purposes a field of human affairs which the economists and the sociologists were cultivating contemporaneously with fruitful results. It was a pity, as well as a paradox, that the historians should feel themselves inhibited from joining in the search for a 'natural order' by their acquisition of the very data that were enabling the sociologists and the economists to make some sense out of a human chaos by establishing two new sciences through the discovery of 'laws of Nature' reigning over virgin soil.

The historians' inhibition was paradoxical because, in all fields of study, both human and non-human, it had been the experience of a Collective Human Intellect that, the greater the quantity of the data, the greater was the precision with which 'laws of Nature' were ascertainable.⁴ This finding holds good, as we have seen, wherever the quantity of the data is not either so small that nothing can be made of them beyond the

⁴ See I. i. 452-7.

establishment of the facts, or else so great that the only practicable way of coping with the data is the method, not of Science, but of Fiction. Western historians might perhaps be forgiven for having failed to find any rhyme or reason in fifteen decisive battles, twelve imāms, seven sages, four Georges, three ages,¹ and other casts in which the dramatis personae had been brought on to the stage in these exiguous numbers;² but, in contrast to the quantity of data yielded by public events, the quantity yielded by ordinary affairs of private people was of just that intermediate order of magnitude that permits 'laws of Nature' governing data to reveal themselves to the human eye. The number of annual harvests, for example, that had been reaped by Man in Process of Civilization between the date of the invention of Agriculture and the time of writing, midway through the twentieth century of the Christian Era, was probably something between 6,000 and 12,000. The number of 'middletowns' that had come and gone from the *floruit* of Heliopolis and Ur and Harappa to the *floruit* of Chicago and Magnitogorsk and Shanghai must have run, all told, into some scores of thousands. The economists and sociologists had been showing what could be done with data presenting themselves in these quantities. Why was it that the historians were not taking the same advantage of the same opportunity?

The historians seem to have missed this opportunity by falling into a snare and a delusion. The snare was an obsession with their own professional technique;³ the delusion was a mistaken impression that the panorama of History was incomprehensibly complex.

'For students of modern history it was an important moment when the young German historian Ranke, looking at the Age of the Renaissance, took various authors of that period, who had written the chronicles of their own times, and by various forms of detective-work undermined their credibility. The novelty of his technique was perhaps exaggerated in the nineteenth-century,⁴ but it established the fact that you were foolish

¹ A critique of the Late Modern Western historians' conventional periodization of the history of Man in Process of Civilization into an 'ancient', a 'medieval', and a 'modern' age will be found in I. i. 168-71.

² It was noteworthy, however, that, of the five numbers here cited, the last two only would be decidedly too small to reveal underlying regularities and uniformities by giving the play of Chance on the surface a sufficient scope for it to neutralize itself.

³ 'The number usually need not be at all large for the chances to average out. With the typical example of spinning a coin, even a quite small number like ten will almost count as a large number in the sense that, if the coin is spun ten times, the number of heads will rarely be more than two away from five, which is the average number of heads. In most matters concerned with probability, three or four count as small numbers, ten as a fairly large number, and a hundred as a very large number' (Darwin, C. G.: *The Next Million Years* (London 1952, Hart-Davis), p. 90).

⁴ By the time when this authoritative pronouncement by one of the most eminent mathematical physicists of the present writer's generation was published, the writer had been spending some twenty-five years of his working life on mental operations with twenty-one specimens of the species 'civilizations' without having any assurance that this number was, in truth, large enough for his requirements. He was proportionately elated when he came to this passage in Sir Charles Darwin's book.

⁵ See I. i. 1-8.

⁶ Ranke had certainly been anticipated by a school of Chinese philologists and textual critics in the Far Eastern World in the age of the Han (see pp. 58-59, above) and by a school of Greek documentarists in the Hellenistic-Aristotelian age of Hellenic history. If Ranke and his disciples had taken to heart the two historical facts that Aristotle had organized the manufacture of a digest of the constitutions of 158 parochial states, and that Craterus had assembled a corpus of Athenian official

to depend on the contemporary chroniclers and narrative-writers of the sixteenth century if you wished to know what really happened in that period—you must go to official documents.¹ . . . The intensity of criticism

documents recorded in inscriptions, there might have been little more spirit left in them than was left in the Queen of Sheba after she had made her inventory of King Solomon's apparatus (1 Kings x. 5).—A.J.T.

¹ Scholars go to official documents at their peril if they have not previously trained themselves for interpreting them by having taken a hand in the manufacture of them; and Modern Western documentarians who had neglected this precaution would have been well advised to take warning by the cautionary tale of Aristotle's anonymous research assistant who, in the compilation of the narrative section of *The Constitution of Athens*, had the temerity to discard Thucydides' account of the *coup d'état* in 411 B.C. that had brought into power the ephemeral régime of 'the Four Hundred'. In our post-Rankean Age of Western intellectual history we can recapture the conscientious young woman's thrill when her patient exploration of the papyrus in the Record Office at Athens, or of the stelae on the Acropolis, was rewarded by her discovery of the series of official documents manufactured in the official year within which the episode of 'the Four Hundred' had occurred. 'Who could have dreamed', she must have cried, as she was excitedly announcing her discovery to her august master, 'that our documentary technique would vindicate itself as sensationally as this? By going to the official documents we have now demonstrated how foolish it is to depend on Thucydides if one wants to know what really happened in that period.' Here indeed, as Horace was one day to write, *bonus dormitat Homerus* (*Epistulae*, Book II, Ep. iii, l. 359); but a latter-day historian's detective-work would not be complete until he had established the identity of the 'napping Homer' in the case, and here the last laugh turns against, not Thucydides, but Aristotle; for it was Aristotle . . . when he condescendingly put his own name to his ingenuous . . . The discrepancy between Thucydides' chronicle and the contemporary official documents which the young woman had pointed out to Aristotle was indeed just as glaring as she had reported it to be; but, unfortunately for Aristotle's reputation, the explanation that he had allowed his pupil to impose upon him was a mare's nest.

The true story of the *coup d'état* of 'the Four Hundred' *wie es eigentlich gewesen* ('in the famous words of Ranke') turned out after all to have been the tale told by Thucydides on the authority of participants and witnesses whose evidence he had sagaciously followed though he tactfully withheld their names. The discrepant documents in the Athenian public records were (if the young blue-stocking was not in error in assigning the date of their manufacture to the time when the Four Hundred were in power) untruthful and, by the same token, authentic. They were untruthful because they had been manufactured (if manufactured at that time), on instructions from 'the Four Hundred', for the serious practical purpose of covering their politician-fabricators' tracks by throwing dust in academically innocent eyes. Thucydides, of course, was not taken in; he had once been in politics himself, and he was alive to the disreputable tricks of the trade; but 'the Four Hundred' did score a notable posthumous success when their documentary dust-cloud (if the credit for having raised it could truly be claimed by them) put Aristotle off the scent—and this after the location of the truth had been revealed to any sharp-eyed huntsman by the good dog Thucydides' shrewdly pointing tail. This re-vindication of Thucydides' veracity was a feat of Modern Western detective-work to the credit of M. O. B. Cary (see *The Journal of Hellenic Studies*, vol. xxxiii (London 1913, Society for the Promotion of Hellenic Studies), pp. 1-18; vol. lxxii (1952), pp. 56-61).

This posthumous success of 'the Four Hundred's' documentary imposture fully recouped these politicians for an expenditure of time and thought which, if they did spend them, they could ill afford to spare for the luxury of whitewashing themselves in the midst of a crisis in which they were struggling for power and life. A documentary misrepresentation of the truth that took in Aristotle had certainly not been labour lost. All the same, the Four Hundred, being men of action, were, no doubt, acting on shorter views, and working for quicker returns, than this in any documentary hoax that they may have committed. The normal motive for manufacturing an official document is to produce some immediate practical effect in current politics. The intention may be to prevent something from happening, to make something happen, or to create a false impression about something that has happened, or not happened, already; there are divers practical purposes which the manufacture of official documents can be made to serve; but there is one purpose—one which, though theoretically possible, would hardly occur to anyone but an historian—which the historian would be wise to leave out of his reckoning: the manufacturer of official documents is never inspired by an academic concern to record the truth for the benefit of future historians; for, from the man of action's standpoint, the briefing of future historians is, at best, unprofitable and, at worst, imprudent.

This is a cardinal consideration which historians seldom bear in mind, though

and the awareness of the possible pitfalls increased in a remarkable manner as time went on. . . . The development of the scientific method in nineteenth-century historiography did not merely mean that this or that fact could be corrected, or the story told in greater detail, or the narrative amended at marginal points. It meant that total reconstructions proved to be necessary, as in the detective stories, where a single new fact might turn out to be a pivotal one; and what had been thought to be an accident might transform itself into an entirely different story of murder. In these circumstances, evidence which had seemed to mean one thing might prove to be capable of an entirely different construction.¹

This nineteenth-century experience had two psychological effects. The Modern Western historians' discovery for themselves of the classic technique of 'detective-work' gave them an unwarranted sense of masterly power; the dissolution of once hard-looking facts under corrosively acid documentary tests gave the same historians an undue sense of helpless impotence. The more confident they became of their technical ability to handle the facts, the less confident they remained of their intellectual ability to apprehend these facts, not to speak of making any sense out of them; and these two conflicting psychological forces found their resolution in a concentration on professional technique both as an end in itself and as a mental city of refuge;² for here were sands in which an ostrich could reassuringly bury his head when the sight of a pursuing Hound of Heaven had got upon the fugitive's nerves.

The snare of historical technique has been exposed by the Western Christian historian whom we have just quoted:

'We fall into certain habits of mind and easily become the slaves of them, when in reality we only adopted them for the purpose of a particular technique. It is as though people could be so long occupied in tearing flowers to pieces and studying their mechanism that they forget ever to stand back again and see the buttercup whole. It is possible that in the transition to the modern outlook the World was guided much less by any deliberated philosophy than is often assumed, and I think that few people could be said to have come to that modern outlook by an authentic process of thinking things out. Men are often the semi-conscious victims of habits of mind and processes of abstraction like those involved in technical historical study or in physical science. They decide that for purposes of analysis they will only take notice of things that can be weighed and measured, and then they forget the number they first started from and come to think that these are the only things that exist. . . .'³

politicians seldom fail to act on it. Among the official documents with which the writer of this Study happened to be acquainted, the Hossbach Memorandum of the 10th November, 1937, recording the minutes of a conference held in the Reichskanzlei, Berlin, on the 5th November, was perhaps the only one that, by any stretch of the imagination, could be supposed to have been manufactured out of deference to an academic ideal. At any rate, the writer of this Study could not think of any credible motive for putting this incriminating record on paper except a concern to facilitate the future task of the Nazi war-criminals' historian-prosecutors. This one academically exemplary official document was, however, a joker in a pack in which most other cards were severely practical in their design. It was not Hitler's Colonel Hossbach, but the Four Hundred's anonymous secretary, who was the typical representative of the official document manufacturers' profession, and it was surely significant that an ingenious Hossbach should have been an ingenious Ranke's fellow-countryman.—A.J.T.

¹ Butterfield, Herbert: *Christianity and History* (London 1949, Bell), pp. 12, 13, and 14-15.

² See the passage of Butterfield's work quoted on p. 191, above.

³ Butterfield, op. cit., p. 21.

Yet, even so, insidious though these toils of technique might thus prove to be, the example of the social scientists suggests that the captivated historians need not have remained prisoners if a failure of nerve had not scared them into hugging their technological chains. After having been intimidated by an ever more sensitive 'awareness of the possible pitfalls' in a mental landscape in which a once solid Earth was melting into a dreamlike kaleidoscope of 'total reconstructions', these distracted latter-day Western historians were appalled by a nightmare in which they saw this Protean chaos solidifying again, only to confront the tormented observer with a novel universe of an incomprehensible complexity; and this prospect made the sheltering sands of technique look like the only practicable refuge from the mental hell of being compelled to play an eternal game of croquet with the unmanageable implements prescribed for the luckless players of the game in Lewis Carroll's fantasy *Alice through the Looking-glass*.

If the latter-day Western historians' own appreciation of their plight had been correct, this plight would have been desperate indeed; but fortunately their attempt to distinguish between Appearance and Reality happened to be an outright inversion of the truth. The nightmare vision of Reality from which they were seeking shelter in the sand-heap of technique was an illusion generated by this obscurantist technique itself. The apparent dissolution of a once stable world into a Protean chaos of infinitesimally small vagrant electrons, which would re-form into an infinitely complex universe if they were ever to re-form at all, was not the apocalypse of an appalling Reality; it was the illusory optical effect of a distortingly diffractive lens; and the nightmare could be dispelled in an instant by the simple salutary act of dropping this delusively sophisticated apparatus and reverting to the effective use of the naked eye.

The physical eye itself presents a living allegory of this tragi-comedy of an intellectual *malade imaginaire*:

'In an organ like the eye there are two points that are equally striking: the complexity of the structure and the simplicity of the way in which it works. . . . The eye is a machine composed of an infinite number of machines which are all extremely complex, yet eyesight is a simple fact. The eye has merely to open for eyesight to come into action. . . . It is this contrast between the complexity of the organ and the unity of its operation that is intellectually disconcerting. . . .

'As a general rule, when an object looks simple from one side and infinitely composite from the other side, the two aspects are far from being of equal importance or—to put it more precisely—far from being on a par with one another in degree of reality. In such cases the simplicity is intrinsic to the object itself, while the infinite complexity is an effect of views that we take of it as we reconnoitre it, of disparate symbols through which our senses or our intelligence represent the object to us, and, in a more general way, of elements of a different order with which we try to imitate the object artificially, but with which nevertheless it remains incommensurable because its nature is different from theirs.

'An artist of genius has painted a figure on his canvas. We can imitate his picture in mosaic, in pieces of many colours, and, the smaller and the more numerous these pieces are, and the greater the variety of their shades

of colour, the better we shall be able to reproduce the curves and nuances of our model. But we should require an infinite number of infinitesimally minute components, presenting an infinite number of nuances, in order to obtain the exact equivalent of a figure which the artist has conceived as a simple thing, which he has sought to transfer to his canvas *en bloc*, and which approaches perfection in its presentation in the measure in which it reveals itself as being the projection of an intuition which is indivisible . . . because [in the artist's own work] there has really been no such thing as an assemblage of pieces in a mosaic. What has happened is that the picture—by which I mean the simple act projected on to the canvas—has spontaneously decomposed in our eyes, through the mere fact of having come within our perception, into thousands and thousands of little pieces which, in their re-composition, present the spectacle of a wonderful arrangement.

'In the same way the eye, with its marvellously complex structure, might be nothing more than the simple act of sight, in spite of its splitting up, as it does, for us into a mosaic of cells, whose order appears marvellous to us when once we have represented this totality to ourselves as being an assemblage.

'If I raise my hand from Point A to Point B, this movement presents itself to me in two aspects simultaneously. Felt from within, it is an act that is simple and indivisible; perceived from outside it is the course of a particular curve AB. In this line I can distinguish as many distinct positions as I choose, and the line itself can be defined as a particular co-ordination of these positions among themselves. But this innumerable host of positions and the order linking one position with another are automatic products of the indivisible act in which my hand has moved from A to B. . . .

'It is the same with the relation of the eye to the eyesight. . . . [So far from Nature's having] produced the simple act of seeing by performing a Herculean *tour de force* with an infinite number of infinitely complicated elements, it has cost her no more trouble to make an eye than it costs me to raise my hand. Nature's simple act has split up automatically into an infinite number of elements which will all be found co-ordinated with a single idea, as the movement of my hand has precipitated an infinite number of points which all prove to answer to a single equation.'¹

In the light of Bergson's intuitions, we can see that the latter-day Western historians' nightmare was the illusory visual effect of an intoxicating technique. The Saint Vitus's dance of an infinite number of infinitesimally small data which these self-confounded intellectual technicians saw through their perversely granulated lens was a shadow play substituted by this distorting medium for the simplicity and integrity of real life. The previously unpublished data which Western researchers had been eliciting from Western archives, private and public, in apparently overwhelming quantities were, in truth, not so many integral facts, but merely so many artificial fragments into which the integral facts had been arbitrarily pulverized by a nihilistic technique. While the shivered splinters had become unmanageably numerous and complicated, the intact bones remained intelligibly few and simple. The true crux of History, in fact, was that the significant known integral events in the history of Man in Process of Civilization were, not awkwardly abun-

¹ Bergson, H.: *L'Évolution Créatrice*, 24th ed. (Paris 1921, Alcan), pp. 96-100.

dant, but awkwardly scarce;¹ and the question on which the possibility of ascertaining 'laws of Nature' in this episode of history turned was the question whether the significant known integral events were actually numerous enough to provide a basis for generalizations.

This experience is described in the following testimony from the pen of a practised investigator of the working of 'laws of Nature' on the economic plane of latter-day Western social life:

'The volume of economic statistics is certainly imposing—it is even intimidating at first sight. But on closer inspection the mass proves to consist less of a multiplication of independent observations upon particular phenomena than of observations upon a vast variety of phenomena, and of the infinite detail in which certain processes must be observed. . . . As an investigator gets deeper into a quantitative analysis of business cycles, his first impression that the statistical data to be dealt with are embarrassingly abundant turns into a conviction that they are painfully inadequate.'²

The agnostics who put their finger on the scarcity of significant known events as their ground for denying the possibility of discerning 'laws of Nature' in the history of Man in Process of Civilization were thus at any rate nearer the mark—mistaken though they too might be—than their fellow agnostics whose identical denial was based on the contradictory thesis that the hoppers in their factory had been choked by a plethora of overproduction.

This case for agnosticism on the ground, not of a redundancy in the data, but of an insufficiency, is judiciously presented in the following passage from the pen of a distinguished twentieth-century Western historian:

'The reading public asks for a final interpretation of History, and for an answer to the question why civilisations rise and fall. Is there, as Hume thought, a tidal movement in human affairs and nothing more than this tidal ebb and flow? Is there no hope of stability or of unmixed achievement in the temporal sphere? Or can it be said that, in spite of ages of regression towards barbarism, historians are able to bring evidence of progress towards a desirable end?

'To these questions British historians are not very ready to give an answer, and, in general, the answers which are given are not put forward by the most learned or the most profound scholars. In the preface to his *History of Europe*, H. A. L. Fisher wrote that he had no ultimate philosophy of history. Such a view does not imply scepticism, or even lack of belief in the possibility of a final synthesis. The difficulty at present is that the *data* are insufficient.³ To a historian the history of the World of Man is a very short history. The years of the astronomers and the geologists reach beyond a historian's reckoning; a small fraction only of these vast epochs is covered by the period during which Man, with knowledge

¹ See I. i. 455–6.

² Mitchell, W. C.: *Business Cycles: The Problem and Its Setting* (New York 1927, National Bureau of Economic Research, Inc.), pp. 203 and 205.

³ 'It is not—to my mind—altogether paradoxical to say *also* that we know too much. I mean, we know so many facts which lend themselves to arrangement in patterns that we can make any number of such patterns; but we do not know enough to judge between these patterns or to be sure that we are doing more than pick out chance or superficial resemblances' (Sir Llewellyn Woodward in a letter of the 25th July, 1952, to the writer of this Study).

of the wheel, of fire, of pottery, and of edged tools, has set out to be master of his environment. Within this fragment of Time, the history of Lettered and Civilised Man fills an even smaller space. It is therefore not remarkable that a satisfactory clue has yet to be found to the meaning of the strange acts of the strangest of living creatures. Bede tells the story of the Northumbrian thane who compared the life of Man on Earth, in relation to the unknown immensity of Time, to a moment in which a bird might fly into the warmth of a hall in winter, and then be lost to sight again in the storm—*de hieme in hiemem regrediens*. Of this short space of Time men had knowledge; they knew nothing of what had gone before, nothing of what might follow after.¹

British historians are not necessarily without "care of knowing causes" if they refuse to commit themselves to any more definite judgment upon the pattern of History and the meaning of human existence.²

¹ In the famous passage (Baeda: *Historia Ecclesiastica Gentis Anglorum*, Book II, chap. 13) that Sir Llewellyn Woodward has cited here so aptly to illustrate his own thesis, the actual terms in the comparison are, of course, not the brevity of the civilizations' Time-span up to date by contrast with the immensity of the Time-span posited by Anthropology, Geology, and Astronomy, but the brevity of a soul's visible life on Earth by comparison with the immeasurable magnitude of this same soul's mysterious non-terrestrial history. The relevant words are *vita hominum in terris, ad comparationem eius, quod incertum est, temporis* and *ita haec vita hominum ad modicum apparet; quid autem sequatur, quidve praecesserit, prorsus ignoramus*. The meaning of these words seems clear, and it is clinched by the context; for the debate in which these words are reported by Bede to have been spoken was a discussion in the *witenagemot* of the Kingdom of Northumbria, and the question at issue was whether to abide by a traditional Paganism or to be converted to Christianity; it was not the question whether the data for studying the history of Man in Process of Civilization were at present to be deemed insufficient—on a criterion to be found in the estimated scale of Anthropological, Geological, and Astronomical Time—for attempting to make sense of this post-primitive current episode of human affairs.

The subject of the Northumbrian notables' debate was, in short, not History, but Religion and Politics. If, however, we could imagine the debate raised by Sir Llewellyn Woodward before or after their historic debate, the question raised by Sir Llewellyn Woodward, we can be sure, *a priori*, that, whether they had been converted pagans or been speaking as recent converts to the Christian faith, the Northumbrian notables have been as confident of their ability to read the riddle of the terrestrial history of Mankind as they were shy of trying to read the riddle of the eternal destiny of a soul. On the lips of Bede's seventh-century Northumbrian thane, 'the unknown immensity of Time' did not mean the chronological aeons with which the twentieth-century Western geologists and astronomers credited the duration of a Physical Universe; it meant an Eternity that was not commensurate with Time in the astronomer's or the annalist's sense of that word. In the seventh-century *Weltanschauung* of a Northumbrian thane or a Christian Roman missionary, the Time-span of the history of Man on Earth was not dwarfed by the Time-span of the age of the Earth and the far greater age of the Stellar Cosmos, since these seventh-century Western minds had no idea that chronological periods of these latter orders of magnitude might have elapsed already and might be due to go on rolling into the future. In their cosier vista, as presented in both the Christian and the pagan myth, the Cosmos, the Earth, Terrestrial Life, Human Life, and Civilization had all come into existence and entered on their careers in the self-same week; and this imaginary date lay a shorter time back than the estimated date at which the twentieth-century Western historian placed the rise of the earliest civilizations at the culmination of a geological Time-span of almost unspeakably greater length. In this seventh-century *Weltanschauung*, the history of the World of Man nor the, on this estimate, coeval history of the Stellar Cosmos presented a puzzle to which a satisfactory clue had not yet been found; and neither the pagan seventh-century Northumbrian nor the Christian seventh-century Roman inquirer would have hesitated to commit himself to a definite judgement upon a pattern of history whose meaning, so he devoutly believed, had been revealed to Man by God.

Thus, in citing Bede, Sir Llewellyn Woodward is taking a pre-Christian or Christian antithesis between Time and Eternity, not as a precise equivalent, but as a suggestive allegory, of a post-Christian antithesis between one Time-span of one order of chronological magnitude and another Time-span of a different order of magnitude in the same chronological dimension.—A.J.T.

² Woodward, E. L.: *British Historians* (London 1932, Collins, produced by Adprint

The prudent answer to this challenge, at the date at which it was delivered, was King Agrippa's 'Almost thou persuadest me'.¹ It is indisputable that the discovery of 'laws of Nature' by induction cannot be attempted with any prospect of success unless the investigator has at his command a minimum quantity of data to serve as instances for testing hypotheses by the empirical method of trial and error. When the number is less than the minimum—whatever this indispensable minimum may be held to be in the particular field that happens to be under investigation—the margin of possible error in the findings of tentative inductions becomes prohibitively wide; and, on this account, an importunately scientific-minded student of history might have found himself constrained to admit that an unconditional surrender was the only honest response to an agnostic-minded historian's challenge if this had been delivered, not in the first century of a post-Modern Age of Western history, but, let us say, some four hundred years earlier.

If in A.D. 1532, instead of in A.D. 1932 (the year in which Woodward's book was actually published), a seeker after 'laws of Nature' governing the history of Man in Process of Civilization had been taxed to declare the number of the data of the highest order of magnitude in his chosen field of study about which he could claim to possess effective knowledge, a Western scholar at that earlier date would have had to confess an inability to muster more than three data on the requisite scale; and this insufficient figure of three² could not have been bettered at the time by the intellectual heirs to the cultural heritages of any of the other living civilizations. A Western scholar's effective knowledge of civilizations other than his own would have been confined in A.D. 1532 to the Hellenic Civilization, to which the Western was affiliated, and the Syriac Civilization, from which the spark of creativity in Christianity had been derived. A knowledge of the same two extinct civilizations of the second generation would likewise have constituted the entire intellectual stock-in-trade of a contemporary scholar in Orthodox Christendom, in its Ottoman and its Russian provinces alike, and in the Islamic World of the day. A contemporary Far Eastern scholar's knowledge of civilizations other than his own would similarly have been limited to the Sinic and the Indic, while a contemporary Hindu scholar would have had no knowledge of any civilizations except his own and its Indic predecessor. As for the living civilizations of the New World, they were at that moment losing consciousness through being brutally knocked on the head by Castilian *conquistadores*.

On this showing, it is manifest that in A.D. 1532 an agnostic would have been justified in submitting that the data were at present not sufficient to warrant an attempt to discover 'laws of Nature' governing the history of Man in Process of Civilization; and at that date this agnostic argument would have been unanswerable, not only in Western

Christendom, but in the contemporary academies of all the other living civilizations. By A.D. 1932, on the other hand—and that was the year in which the passage quoted above was, in fact, published—the facilities at the disposal of a scientific-minded student of History had been improved and enlarged, out of all recognition, by three achievements that the Western Civilization had accomplished in the course of its intervening Modern Age.

In the first place the explosive aggressiveness of the Western peoples in this age had—for the first time in recorded history—rounded up the whole of Mankind, over a literally world-wide range, into a single oecumenical society; and, while in the first chapter of this gradually unfolding story the unification had been carried out within a frankly Western framework and on the superficial planes of Economics and Politics, it was evident by A.D. 1932 that the heaven was then working its way down to the cultural and spiritual depths of life and that, on these deeper levels, the receptivity of the living non-Western societies to the radiation of Western techniques, institutions, and ideas was preparing the way for a cultural counter-offensive.¹ A culturally servile non-Western intelligentsia, that had originally been called into being, like Frankenstein's monster, to further its callous manufacturer's step-fatherly purposes,² had begun, by the twentieth century, to beget a happier and more fruitful freedmen-class of 'occidentalists' who were making it their mission to serve the need of the hour in the lives of their own societies by interpreting the intrusive Western culture in their own cultural terms and thereby giving the great non-Western majority of Mankind the means of exercising some discrimination in a retaliatory spoiling of the Egyptians. The 'occidentalists' were already beginning to appropriate, for the common use and benefit of Humanity at large, the cultural wealth that had been amassed by an acquisitive-minded West; and in the meanwhile this internationalized stock of honey had been notably increased by the labours of busy Western bees.

If the Modern Western historians had been the sole representatives of Modern Western intellectual enterprise, a robbery of the Western hive in A.D. 1932 would have proved disappointingly unrewarding for the 'occidentalists'; for, in those imaginary circumstances, the occidentalists' plunder in A.D. 1932 would still have been as exiguous as it would have been four hundred years earlier. As we have already noticed, the Late Modern and post-Modern Western historians had done nothing to increase the number of the data of a significantly high order of magnitude that the Modern Western student of the history of Man in Process of Civilization had inherited from his Medieval predecessors. Though the latter-day Western historians had been no less restlessly industrious than the contemporary Western apprentices in other intellectual trades, they had been spending their energies on grinding the already known significant data into details, to the exclusion of any attempt to make significant additions to knowledge by discovering new data on an illuminatingly large scale. While, however, the Western historians had thus been leaving undone those things which they ought

¹ See IX. viii. 64-80.

² See V. v. 154-9.

to have done, their proper study had been magnificently advanced by their proxies the contemporary Western orientalists¹ and archaeologists.²

Since the days of the pioneer Western Sinologist Matteo Ricci (*vivebat* A.D. 1552–1610) and the pioneer Western Arabist Edward Pococke I (*vivebat* A.D. 1604–91), Western orientalists had been making accessible to contemporary Western scholars,³ and hence also to future non-Western occidentals, an effective knowledge of all the living non-Western civilizations and all those extinct civilizations of the preceding generation to which one or other of the living non-Western civilizations happened to be affiliated. Meanwhile, since the 2nd July, 1798, which was the day on which Napoleon had landed in Egypt, a new-model army of Western archaeologists had gone into action shoulder to shoulder with the Western orientalists in an intellectual crusade against a parochial-minded native Western ignorance; and within the next 134 years they had not only brought into clear visibility, out of the twilight, a number of extinct civilizations—the Egyptian, Babylonian, Mexican, Yucatec, and Andean—which had already lain just within the ken of Western scholarship thanks to a few monuments still standing above ground and a few fragmentary and garbled references in the known literary records of other civilizations; the archaeologists had also brought to light—and this was the crowning glory of their rapid series of sensational successes—a number of other extinct civilizations—the Sumerian, Hittite, Minoan, and Mayan, not to speak of an Indus Culture and a Shang Culture—whose oblivion had been so complete that, on the eve of the moment when they were thus brought back within the ken of the living by ringing strokes of pick and spade that simulated in real life the mythical music of a Last Trump, there was no human scholar alive who was aware that these miraculously resurgent forgotten civilizations had ever risen and fallen.

By these veritable miracles of intellectual faith and works, the Western archaeologists and the Western orientalists, between them, had increased the number of civilizations known to Western scholars sevenfold, from a trio to more than a score;⁴ and this immense enlargement of the West's historical horizon which had been thus achieved by Western intellectual pioneers had been won by them, not merely for the West itself, but for an oecumenical Republic of Letters which was a twentieth-century offspring of the West's assault upon the World. How did this revolutionary transformation of a traditional intellectual situation affect the issue between the seeker after 'laws of Nature' in the history of Man

¹ See I. i. 345–6.

² See I. i. 129, n. 1, and 157.

³ The alertness shown by both Voltaire and Gibbon in recognizing, mastering, and turning to account the new datum that had been brought to the West by the scholarship of seventeenth-century and eighteenth-century Jesuit Western Sinologists has been noticed in I. i. 346. Gibbon also made good use of the work of the pioneer Modern Western Arabists.

⁴ In virtue of the archaeologists' contribution to Western knowledge of historical data of a significantly high order of magnitude, twentieth-century Western scholars enjoyed a still greater advantage over Gibbon and Voltaire than Voltaire and Gibbon, in their day, had enjoyed over Bossuet or over Hartmann Schedel, the compiler of the Nuremberg Chronicle (see p. 178, n. 5, above).

in Process of Civilization and the agnostic who argued that the quest was foredoomed to failure because the number of the effectively known significant data was insufficient?

The multiplication of the mustered number by seven was not, of course, in itself any guarantee that the social scientist's case had been won for him by the orientalist's and archaeologist's achievements; for the social scientist's original fund of significant knowledge had been so grotesquely incommensurate with his ambitious purpose that, even when the figure of significant data had been raised from three to twenty-one, it might still perhaps be contended that, for serving as a basis for induction, this seven times larger number was still not large enough. In the present writer's personal judgement, a stock of twenty-one significant data was just sufficient to warrant a search for 'laws of Nature' in the history of Man in Process of Civilization; and, twenty years after the publication of Sir Llewellyn Woodward's book, this judgement had been fortified by the authority of Sir Charles Darwin.¹ But the present writer would not have denied that the margin of practicability provided by a stock standing at this twentieth-century figure—twenty-one—was a narrow one, and, notwithstanding Sir Charles Darwin's comforting assurance that a number no higher than ten would prove sufficient for a comparative study and for the induction of 'laws of Nature', he would have gone so far as to concede that an agnostic who could not have failed to win his case in A.D. 1532 might still—even in spite of the orientalist's achievements during the ensuing two centuries and three-quarters—have had a chance of winning it as late as A.D. 1798, if his book had been out of the printer's hands before the 2nd July of that intellectually momentous year.

Thereafter, in the present writer's view, the intellectual battle on this field had been won for Science by the intervention of the archaeologists in the long-since-combatant orientalist's support. As he saw it, the archaeologists had played here the decisive part that the Prussians had once played on a military battlefield on which their British allies had been bearing the heat and burden of the day. At Waterloo an Anglo-Prussian conjunction of military forces had proved irresistible; and the united intellectual forces of the orientalist and the archaeologist had similarly put the historians to rout. Under a twentieth-century spectator's eyes, these picturesque antinomian warriors had gone down to as ignominious a defeat at the hands of the disciplined champions of Science as their prototypes the Egyptian Mamlûks had suffered on the 21st July, 1798, in the Battle of the Pyramids, when they had been mowed down by the well-timed fire of Napoleon's efficiently manœuvring Janissaries.² The impression made on the writer by the spectacle of this decisive intellectual battle was the experience that had moved him to attempt a study of History; and his answer to the challenge of the agnostics is presented, not solely in the present passage, but throughout the present work.³

¹ See p. 206, n. 2, above.

² Jabarti's graphic account of this battle has been quoted in IV. iv. 458–60.

³ See I. i. 458–9.

(IV) THE OPENNESS OF THE QUESTION

Without prejudice to the eventual findings of our present inquiry into the relation between the respective roles of Law and Freedom in History, we may conclude, from the results at which we have arrived up to this point, that, in repudiating a belief in the reign of Law, Late Modern Western Man (*florebat circa* A.D. 1675–1875) had been guilty of hybris, and that, in divers variations on his antinomian theme, the sinner had carried it to divers degrees of enormity. In their unanimous repudiation of a belief in a 'Law of God', all Late Modern Western minds alike had been making the unwarrantably overweening assumption that they had a deeper insight into the secret of the Universe than the Prophets of Israel, Judah, and Iran and these seers' Christian and Muslim epigoni from Amos through Augustine to Ibn Khaldūn and Bossuet. In their sectarian repudiation of a belief in 'laws of Nature' as well, the antinomian school of Late Modern Western historians had been making a still more overweening assumption that was even more unwarrantable—so unwarrantable and so overweening that it had laid this school of historians open to conviction on a charge of heresy by a jury of scientists who had been the historians' fellow-travellers on the first stage of Western Man's spiritual exodus from the Kingdom of God. The Late Modern Western scientists who had kept the historians company in going the length of throwing over 'the Law of God' had still clung to the skirts of Indic and Hellenic philosophers who had promulgated 'laws of Nature' in the name of the goddess Reason; and the Late Modern Western historians had taken a solitary way¹ when they had defiantly made a virtue of their former fellow-travellers' charge against them that they had denied the validity of 'laws of Nature', as well as the validity of 'the Law of God', in the realm of the affairs of Man in Process of Civilization.

Hybris of any degree in any circumstances is everywhere and always wrong and dangerous; but it was at least comprehensible, though not on that account necessarily excusable, that the Late Modern and post-Modern generations of Western Man should have succumbed to the hybriatic fancy of imagining themselves to be above the Law in the halcyon days that had dawned upon the Western World after the close of the Wars of Religion and the repulse of the second Ottoman assault upon Vienna. In that hour, Western Man had just seen the two giant figures of an Almighty God and a Grand Signor disappear simultaneously from a mental horizon above which both of them had once loomed so formidably large; and he had not paused to recollect the Hellenic poet Menander's admonition that 'all that injures issues from within'.² But the twentieth-century epigoni of the Bayles and Fontenelles had no case at all for retaining their late-seventeenth-century predecessors' complacency in an age which had seen the destructiveness of the Wars of Religion matched, and their atrociousness exceeded, in Wars of Nationality and Ideology that had once again rent the Western Society asunder and, in the act, had conjured up against her an accuser

¹ Milton: *Paradise Lost*, Book XII, l. 649.

² Menander, fragment 540, quoted in IV. iv. 120, n. 3.

more damaging than Islam and an adversary more puissant than the 'Osmanli. Communism was more damaging than Islam because it spoke to the West with the voice of the West's own conscience, and the Soviet Power was more puissant than the Ottoman because it made war on the West with Western material and spiritual weapons. These harrowing and terrifying new Western experiences had demonstrated unanswerably that a century of low tension which had opened for the Western Society with an Ottoman 'cease fire' under the walls of Vienna in A.D. 1683, and had closed for it in A.D. 1775 with the firing, at Concord, Massachusetts, of 'the shot heard round the World',¹ had, after all, been nothing more than a deceptive lull; and, after the successive warnings served on Western Man by History in A.D. 1775, 1792, 1914, 1917, 1933, and 1939, the rake had come to a point in his progress at which his ears ought to have been open to Menandrian saws that certain of his own poets had been saying.² Volney's 'La source de ses calamités . . . réside dans l'homme même' had anticipated Meredith's 'We are betrayed by what is false within';³ and in these sentences a Late Modern Western Antinomianism had written its own self-indictment.

The moral question whether these experiences and admonitions would move Western Man to repent of his hybris was one that could be answered by nobody except the tragic hero himself; but, on the intellectual point at issue between latter-day Western historians and latter-day Western scientists, it seemed reasonable, in the circumstances of A.D. 1952, to ask the historians to meet the scientists to the extent of admitting that it might, after all, at least be an open question whether 'laws of Nature' were or were not to be found governing the affairs of Man in Process of Civilization. Indeed, the openness of the question was actually so patent, the need to look into it so pressing, and the aphasia afflicting the historians so invincible, that it seemed warrantable at this point for a student of History to make the requisite declaration on the historians' behalf.

If we do thus take the liberty taken by godparents in the ministration of the Christian Church's rite of baptism by declaring open for discussion the question whether 'laws of Nature' have any currency in the domain of History, we immediately find a string of supplementary questions unrolling itself.

What (if any) instances of 'laws of Nature' governing the affairs of Man in Process of Civilization are brought to light in fact by an empirical survey of the data? If 'laws of Nature' operative in the realm of History do emerge from our study, what are the possible explanations of their currency? Do such 'laws of Nature' governing human affairs turn out, when we understand them, to be inexorable? Or can their incidence on Human Life be brought under human control at least in some measure? Are there any tracts in the realm of History in which human affairs appear, on the evidence of the data, to be, not amenable to 'laws of Nature', but recalcitrant to them? And, if this, too, is one of the findings

¹ Emerson, R. W., in his quatrain inscribed on the spot where the first shot was fired in the American Revolutionary War. The historical significance of this war has been discussed in IV. iv. 165.

² Acts xvii. 28.

³ See IV. iv. 120.

of an empirical survey, what are the possible explanations of Man's apparent freedom from the rule of 'laws of Nature' in certain circumstances? Is the appearance simply an illusion that arises because our data are insufficient or because our interpretation of them is inadequate? Or have we grounds for surmising that, however great our knowledge and our insight might be, we should never find 'laws of Nature' operative here, because these tracts of human affairs are genuinely exempt from Nature's jurisdiction? If, however, certain tracts of human affairs are genuinely exempt from 'laws of Nature', what are the powers that do reign over these Alsatias? Are they spiritually waste lands swept by wayward winds of Chance? Or are they spiritual arenas for the interplay of Challenge and Response in encounters between personalities?

It will be seen that these last two supplementary questions carry us beyond the bounds of 'laws of Nature' and bring us back face to face with 'the Law of God'. The riddle of the relation between God's Law and a human soul's freedom is the last, the most difficult, and the most crucial of all questions on our present agenda.

B. THE AMENABILITY OF HUMAN AFFAIRS TO 'LAWS OF NATURE'

(I) A SURVEY OF INSTANCES

(a) 'LAWS OF NATURE' IN THE ORDINARY AFFAIRS OF PRIVATE PEOPLE IN AN INDUSTRIAL WESTERN SOCIETY

OUR exploration of the problem of Law and Freedom in History has brought us to the point of assuming that the question whether 'laws of Nature' have or have not any footing in the history of Man in Process of Civilization may legitimately be treated as open for the purpose of making headway in our inquiry. In allowing ourselves to make this postulate, we have bound ourselves to put it to an empirical test. Let us start by making a survey of affairs of Man in Process of Civilization in which 'laws of Nature' do appear to be operative, and then—when we have looked into possible explanations of such phenomena, and into the subsequent question whether 'laws of Nature' are inexorable or controllable in the domain of human affairs, if they do have any currency there—let us go on to make a corresponding survey of affairs of Man in Process of Civilization in which 'laws of Nature' appear not to be operative, and let us look into possible explanations of such phenomena in turn.

In embarking on our survey of apparent evidences of an amenability of human affairs to 'laws of Nature', it might be convenient to take our first soundings in the ordinary affairs of private people, since in this tract, in which fishing rights had been venturesomely claimed and profitably exercised by latter-day Western historians, the number of the data was apt, as we have noticed,¹ to run into comparatively high figures, rising from thousands to hundreds of millions, and figures of these orders of magnitude are high enough, and at the same time not too high, to allow of accurate and subtle statistics. Statistically established uniformities and recurrences are capable, not only of being visualized in mathematical curves, but also of being verified by being put to the test of being taken as bases for prediction; and, in the Western World at a date some two hundred years after the outbreak of the Industrial Revolution in Great Britain in the latter part of the eighteenth century of the Christian Era, the possibility of accurately working out statistical expectations in the light of the statistical patterns presented by arrays of relevant accomplished facts had been amply demonstrated by the magnitude of the financial profits earned by entrepreneurs who had staked their capital on a faith that, in their social milieu, the ordinary affairs of private people were governed by 'laws of Nature' that were at least sufficiently regular to be both ascertainable and trustworthy.

There were two principal departments in the province of private people's ordinary affairs in which commercially profitable predictions, made on the basis of statistical patterns detected in the data of past his-

¹ See pp. 205-6, above.

tory, had come to be commonplaces of latter-day Western business activity. One of these two sources of profit from predictions based on past statistics was the business of catering for divers markets for goods and services; the other was the insurance business. Catering was, no doubt, coeval with Civilization itself, though the scale on which it had come to be practised in the Western World, and the narrowness to which the margins of error and profit had been reduced *pari passu*, in this Western social milieu, by the competitiveness of Western capitalistic enterprise in its adolescence, may have been without precedent in other civilizations' histories. As for the insurance business, the insurance of commercially valuable commodities other than merchant ships and their cargoes seems to have been a Late Modern Western innovation; and, when we glance at the divers ramifications of a latter-day Western insurance business, we find in them as many demonstrations that 'laws of Nature', operating regularly enough to afford possibilities of making financial profits from statistical predictions with narrow margins, were in force, not only in the realm of Non-Human Nature in which the risks of damage or destruction by the blind fury of storm or tempest were run by sailors in ships at sea, but also in fields in which a waywardly purposeful human intelligence and human will had some power arbitrarily to interfere with a Non-Human Nature's course.¹

The proven profitability of the insurance business in quoting premiums for accepting risks on storm-damage to ships and crops, lightning-damage to ricks and buildings, frost-damage to waterpipes, and pest-damage to fruit-trees and livestock was neither so remarkable nor so significant as the likewise proven profitability of insurance policies into which the human factors of intelligence and will did enter in divers measures. The death, for example, that was the subject of the wager in a life policy² was an event which the human intelligence and will were

¹ This latter-day Western insurance business was conducted on the assumption that God, if He existed, was the god of the eighteenth-century deists, who could be counted upon to be content to reign, while leaving it to Nature to govern and leaving it to Man to harness Nature by exerting his intellectual ingenuity upon her. In the technical terminology of this business, 'an act of God' was an event which, in the business relations between the two parties to an insurance policy, was the counterpart of a miracle in the Jewish, Christian, and Muslim meaning of that term, because it was something that had not been foreseen or provided for in the policy, as a miracle was something incongruous with what had come to be taken as being the normal course of Nature. An earthquake, for example, would be 'an act of God' in the construing of a policy on the structure of a building which gave cover only against the risk of damage or destruction by fire; but it would not be 'an act of God' in the construing of a policy which did cover the risk of damage or destruction by earthquake as well. It will be seen that the sphere of God's operation, in the meaning of this quaint professional jargon, would be perpetually expanding or contracting in accordance with the variations in the terms of the contracts negotiated between underwriters and their clients.

² The latter-day Western life insurance business could never have been launched if the pioneer entrepreneurs in this field had not been able to lay hands on data for statistics that were both abundant enough and accurate enough to enable them, from the outset, to quote rates of premium in which the margin of allowance for the element of statistical uncertainty would be narrow enough to make it possible for the transaction to fulfil simultaneously the two commercially requisite conditions of being neither prohibitively expensive for the party seeking to be insured nor prohibitively hazardous for the party proposing to invest capital in covering the acceptance of risks.

This statistical stock-in-trade with which the pioneer Western life insurance companies started business consisted of the statistical patterns discernible in three sets of data: 'the Breslau Table' (*editum* A.D. 1693) compiled by Dr. Edmund Halley from records of deaths in the Silesian city of Breslau in the years A.D. 1687-91; 'the Northampton Table'

able in some cases to postpone, though they were powerless to avert it in the long run, while, in an age in which Western preventive medicine was making sensational advances, will and intelligence were showing themselves able to mitigate, and even to avert, sickness on the grand scale, without, of course, being able to prevent death through sickness from supervening in the last resort. When it came to accepting risks of accidents, the insurance business was venturing into a field on the borderline between the domain of a physical and a subconscious psychic life, that were both governed by ascertainably, and therefore predictably, working 'laws of Nature', and the domain of a personal intelligence and will that were free to pursue their own purposes. The risk of accidents being caused by personal carelessness and recklessness was manifestly far less easy to calculate than the risk of automatic physical and subconscious psychic responses proving inadequate to cope with an emergency occurring too suddenly to give the party's will and intelligence the time to come into action. Nevertheless, the insurance business had found it profitable to cover risks not only of accidents but of burglaries, which were conscious, deliberate, and often carefully planned personal acts.

The fact that commercial profits could be made out of insuring against risks of burglaries demonstrated that individual acts of human will might be subject to 'laws of Nature' that would be statistically ascertainable if the instances could be mustered in sufficient numbers; and this commercially successful establishment of a burglary branch of the insurance business in the history of a Late Modern Western Society was also an indication that the dominion of 'laws of Nature' over individual acts of will might prove not to be confined to the ordinary affairs of private people but to extend to those extraordinary public affairs which had been the conventional theme of History in all societies in process of civilization¹ until the nineteenth-century Western historians had expanded their horizon to include the ordinary affairs of private people in their panorama. The latter-day Western phenomenon of burglary insurance had this historical significance in the field of public affairs because burglaries were the counterparts in private life of acts of military aggression and diplomatic chicanery in public life—as a captured Tyrrhenian pirate

(*editum* A.D. 1783) compiled from records of deaths, recording the ages at death, in a parish comprising the greater part of the English city of Northampton in the years A.D. 1735-80; and 'the Carlisle Table' (*editum* A.D. 1815) compiled from censuses taken in A.D. 1780 and 1787 and from records of deaths in the years A.D. 1779-87 in two parishes of the English city of Carlisle.

When once the life insurance companies had begun to transact the business which this original fund of statistical information had enabled them to start, their own records began to provide them with a great and ever growing volume of data to serve them for the elaboration and refinement of their statistics with an eye to increasing their aggregate profits by transacting business on ever narrower margins. The first table to be constructed entirely from life insurance records was 'Morgan's Equitable Table' (*editum* A.D. 1834), which was based on the experience of the Equitable Life Assurance Society.

Accounts of these primordial foundations on which the Modern Western life insurance business's indispensable statistical apparatus was originally based will be found in Farren, E. J.: 'The History of Assurance', in *The Assurance Magazine*, vol. i (London 1851, Layton), pp. 42-46; Raynes, H. E.: *A History of British Assurance* (London 1948, Pitman), pp. 125-30; Anderson, J. L., and Dow, J. B.: *Actuarial Statistics* (Cambridge 1948, University Press, 2 vols.), vol. ii, pp. 158-60. The writer of this Study was directed to these authorities by the kindness of Mr. Thomas Wallas, the General Manager of the London and Lancashire Insurance Company, Ltd.

¹ See pp. 182-4, above.

once pointed out to a self-righteous Alexander the Great, if we are to give credence to a celebrated anecdote.¹ Meanwhile, in the field of private affairs, the recognition that individual acts of will had only to occur in sufficiently large numbers in order to become amenable to commercially lucrative statistical calculations was a discovery that had not had to wait for a latter-day Western insurance business to bring it to light. The economic demand that had been profitably catered for by the Egyptian potter, the Nomad conductor of caravans, and the Syriac innkeeper, long before any Western manufacturing concern, omnibus, railway, or airways company, or hotel or restaurant proprietor had put in an appearance, was, of course, for the purpose of our present inquiry, a statistical quantum of the same quality as the insurance risk of burglary, inasmuch as it was a collectively regular, and therefore predictable, statistical pattern emerging from an aggregate of individually wayward, and therefore unpredictable, acts of personal will.

(b) 'LAWS OF NATURE' IN THE ECONOMIC AFFAIRS OF AN INDUSTRIAL WESTERN SOCIETY

The statistical patterns discernible in the fluctuations of demand and supply in the dealings between caterers and their customers were woven, in the social woof and weft of an Industrial Western Society, into a wider network of economic regularities, uniformities, and recurrences revealing themselves statistically in the aggregate effects of numerous personal acts which, individually, were too wayward to be predictable. At the time of writing, half way through the twentieth century of the Christian Era, the state of knowledge and the range of activities in this particular field were illuminating for the study of the questions whether the affairs of Man in Process of Civilization were or were not governed by any 'laws of Nature', and, if they were, then to what extent and degree. By this date the man in the street in an Occidental Babylon had already long since come to take for granted the reality of 'booms' and 'slumps' whose alternations had made or marred his private fortunes perhaps more than once in his own personal experience; but the pattern of these popularly recognized 'business cycles' had not yet been worked out in statistical terms with sufficient clarity or precision to have emboldened the in-

¹ 'If justice is eliminated, what are states but gangs of robbers writ large (*quid sunt regna nisi magna latrocinia*)? For, after all, what are gangs of robbers but states writ small? . . . The captured pirate's retort to Alexander the Great was as neat as it was true. When the king asked the man what he meant by infesting the sea, he gave the frank and truculent answer: "What do you mean, pray, by infesting the globe? The only difference is that, because I do it with one small ship, I am called a robber, while you are called an emperor because you do it with a great fleet."—Saint Augustine: *De Civitate Dei*, Book IV, chap. 4, already quoted in VI. vii. 210, n. 1.

This truth had, of course, always been unpalatable to heads of states. Early in the year A.D. 1936, one of Hitler's subjects who had invited the writer of this Study to give a lecture in Berlin found himself constrained to translate orally to his Führer a passage in one of this prospective visitor's published works in which the Englishman had written that 'it was shocking to see the head of a state—even when he was the leader of a recently victorious revolutionary movement—shooting down his own former henchmen in the style of an American "gangster"'. On the 29th–30th June, 1934 (*Survey of International Affairs, 1934* (London 1935, Milford), p. 325). Hitler's comment on this was: 'That is not fair, because the gangsters do it for money, and I did not do it for that.' The naïveté of this line of defence was engaging, but it did not impugn the justice of the Tyrrhenian pirate's point.

surance companies to open up a new branch of their business by quoting premiums for insurance against the formidable risks arising from economic fluctuations.¹ On the other hand, scientific investigators had rushed in where business men were still fearing to tread; and, in Modern Western history, disinterested scientific research had been apt to be followed by a profitable industrial application of the results as surely as, in the field of contemporary Western colonial enterprise, the advent of the missionary had been followed by that of the trader and the soldier.

The still disinterestedly academic students of latter-day Western 'business cycles' seemed, *circa* A.D. 1952, to be agreed that these particular economic patterns were peculiar to a social milieu in which a monetary economy had driven a barter economy off the field, in which Agriculture had become socially subordinate to Commerce and Industry, and in which the process of manufacture (in defiance of the etymology of the word) had come to be performed by power supplied, not by the muscles of men and non-human animals, but by inanimate forces of Nature ranging from winds caught in the sails of ships and windmills to electrons liberated in plant capable of splitting atoms.

'Business cycles which affect the fortunes of the mass of people in a country, which succeed each other continuously, and which attain a semblance of regularity, do not become prominent in the economic history of a country until a large proportion of its people are living mainly by making and spending money incomes.'²

'The "cause", if we wish to use that term, of business cycles . . . is to be found in the habits and customs (institutions) of men which make up the money economy, with its money and credit, prices, private property, buying and selling, and so on—all loaded, so to speak, on the industrial process.'³

In the history of the Western Civilization, business cycles had made their epiphany *pari passu* with the prevalence of a money economy in which the incentive to economic action was a desire to earn profits reckoned in monetary values;⁴ and this cyclic rhythm in the flow of economic activity was a phenomenon that appeared to be peculiar to Modern Western business organization.⁵

'Presumably this contention that business cycles arise from that peculiar form of economic organisation which has come to prevail in England within the last two centuries, and over much of the World in more recent times, would be admitted by most theorists.'⁶

'The conception of business cycles obtained from a survey of contemporary reports starts with the fundamental fact of rhythmical fluctua-

¹ The unwillingness of the insurance companies to do business in economic fluctuations up to date was probably due to an excessive uncertainty in the relevant statistics rather than to an excessive timidity or conservatism on the part of business men who had recently ventured no less spiritedly than profitably into the new field opened up for insurance by the mechanization of road traffic.

⁵ See *ibid.*, p. 61.

⁴ See Mitchell, *op. cit.*, pp. 62 and 63.

⁶ *Ibid.*, p. 56.

tions in activity, and adds that these fluctuations are peculiar to countries organised on a business basis, that they appear in all such countries, that they tend to develop the same phase at nearly the same time in different countries, that they follow each other without intermissions, that they are affected by all sorts of non-business factors, that they represent predominant rather than universal changes in trend, and that, while they vary in intensity and duration, the variations are not so wide as to prevent our identifying different cases as belonging to a single class of phenomena.¹

In the intellectual history of an industrial Western Society the phenomenon of trade cycles had been discovered empirically from direct social observation before it had been confirmed statistically from patterns discernible in collections of data.² The earliest known description of it had been given in A.D. 1837 by a British observer, S. J. Loyd, *alias* Lord Overstone (*vivebat* A.D. 1796–1883), in the light of experience in Great Britain since the time of the Napoleonic Wars;³ and there was nothing to suggest that this empirically demonstrated relativity of the phenomenon to the social milieu in which it presented itself was not one of its intrinsic features. In a book first published in A.D. 1927 an American student of business cycles declared his belief that 'the characteristics of business cycles may be expected to change as economic organisation develops'.⁴ On the basis of 'business annals' compiled by another American scholar, W. L. Thorp,⁵ from non-statistical evidence for the economic history of the West in its Industrial Age, a third American scholar⁶ had descried, within the longer Time-span illuminated by this less precise but more widely ranging kind of information, a secular tendency towards a prolongation of the wave-length of 'business cycles' of the shortest kind. In the light of these data, F. C. Mills had calculated that the mean wave-length of a short cycle was 5.86 years in the early stages of industrialization, 4.09 years in a subsequent stage of rapid economic transition, and 6.39 years in a succeeding state of relative economic stability; and, in the judgement of the first of the three American scholars just cited, expressed in a book first published in A.D. 1927,⁷ 'there can be little doubt that the average duration of business cycles has undergone secular changes in the countries for which Thorp has compiled the longest records'. In a book published in A.D. 1939 a German economist, in whose belief 'innovation' was 'the outstanding fact in the economic history of Capitalist Society'⁸ and was at the same time the cause of the cyclic fluctuations in

⁷ Mitchell, W. C.: *Business Cycles, the Problem and its Setting* (New York 1930, National Bureau of Economic Research, Inc.), p. 415.

⁸ Schumpeter, *op. cit.*, vol. i, p. 86. The same authority, in *op. cit.*, vol. i, p. 223, defines Capitalism as 'that form of private property economy in which innovations are

this society's economic life, made it clear that this thesis of his was restricted in its application to the social milieu of the Western World in its Industrial Age,¹ and hazarded the guess that this particular social milieu in this particular society might already be passing away by the time at which he was writing.² In a book published in A.D. 1947 a Belgian economist had expressed the view that

'l'expansion contemporaine . . . ne peut être qu'un épisode de l'histoire de l'humanité et doit se terminer un jour, soit devant des impossibilités matérielles de continuer, soit parce que le complexe économique et social provoque la désagrégation de l'effort, soit enfin parce que les aspirations collectives se donnent un autre bout'.³

Yet, ephemeral though the social milieu of these pulsations in the flow of economic activity might prove to be, and brief though the experience of these peculiar phenomena, occurring in these peculiar circumstances, had actually been up to date, the fathers of a Western economic science had succeeded, within less than two hundred years of the outbreak of the Industrial Revolution in Great Britain,⁴ in describing economic cycles of divers wave-lengths in latter-day Western history, without allowing themselves to be inhibited by an age-old conundrum of Formal Logic that was paralysing contemporary non-economic Western historians. The Western economists satisfied the non-economic historians' most exacting Rankean requirements in studying the course of history *wie es eigentlich gewesen* and in taking due account of the element of uniqueness in each single historical datum; but, unlike the non-economic historians, they did not fail to grasp the not very novel or abstruse logical points that there was also an element of uniformity common to one datum and another and that this element of uniformity, so far from being proved illusory by the coexistence of the element of uniqueness, was the background against which the element of uniqueness showed up, and without which it would have been invisible.⁵

This difference-in-likeness and likeness-in-difference was noted, for example, by an investigator who had described a series of seven cycles in the fluctuations of the incidence of unemployment in the economic history of the United Kingdom during the years A.D. 1850-1914:

"The general movement is . . . rhythmic, both in respect of wave-lengths and of amplitude. . . . The rhythm is rough and imperfect.⁶ All

carried out by means of borrowed money, which in general, though not by logical necessity, implies credit creation'.¹ See Schumpeter, *op. cit.*, vol. i, pp. 144 and 223.

² See *ibid.*, p. 145.

³ Dupriez, L. H.: *Les Mouvements Économiques Généraux* (Louvain 1947, Institut de Recherches Économiques et Sociales, 2 vols.), vol. ii, p. 280.

⁴ In Schumpeter's opinion, the minimum span of known history that was required for a study of cycles in Modern Western economic life was of the order of 250 years (*op. cit.*, vol. i, p. 220).

⁵ The truth is, of course, as has been pointed out by W. C. Mitchell in *Business Cycles, the Problem and its Setting* (New York 1930, National Bureau of Economic Research, Inc.), p. 382, that the problem presented by the simultaneous uniqueness and uniformity of the specimens of a species is a general problem of thought, not a special problem peculiar to thought about business cycles.

⁶ According to Mitchell, *ibid.*, pp. 377 and 453-4, the statistical and the annalistic evidence concurred in indicating that business cycles were 'cyclic' in the sense of being measurable recurrences, but were not 'periodic' in the sense of being measurable recurrences with a uniformly regular wave-length.—A.J.T.

the recorded cycles are members of the same family, but among them there are no twins.¹

The same finding was reported by a student of the general economic history of Great Britain during the years A.D. 1790-1914:

'A reading of the evidence, statistical and qualitative, on the movements within the British economy in modern times, taken year by year, month by month, or week by week, leaves two enduring impressions. First, one is impressed with the uniqueness and variety of the story of economic life. The combinations of forces within the moving economy are, like those in political life, in an important sense always new and fresh. No year is quite like another year;² and after a time one gets to know them like old friends. . . . Second, one is impressed with the solid reality of the cyclical pattern which steadily recurs, in Britain and then—gradually widening—throughout the World,³ from the end of the American Revolution to the outbreak of the First World War. No two cycles, of course, are quite the same; and one can trace, as well, certain long-period changes in the character of cycles. But it is evident that the whole evolution of Modern Society in the West occurred in a rhythmic pattern, which had consequences for social and political, as well as for economic, events.⁴

This finding that the spectacle of likeness-in-difference is no peculiar feature of British nineteenth-century economic history, but is discernible in contemporary Western economic history as a whole, is endorsed by an impressive consensus of authoritative opinions. For instance, the authors of an essay in measuring business cycles find that

'Two conclusions emerge from this analysis. In the first place our tests, so far as they go, bear out the concept of business cycles as units of roughly concurrent fluctuations in many activities.⁵ In the second place they demonstrate that, although cyclical measures of individual series usually vary greatly from one cycle to the next, there is a pronounced tendency towards repetition in the relations among the movements of different activities in successive business cycles. Our analysis of hundreds of time series is sufficiently advanced to give us full confidence in these conclusions. Later monographs will demonstrate . . . that business-cycle phenomena are far more regular than many historical-minded students believe.'⁶

'Strictly speaking, every business cycle is a unique historical episode. . . . Business cycles differ in their duration as wholes and in the relative

¹ Pigou, A. C.: *Industrial Fluctuations*, 2nd ed. (London 1929, Macmillan), pp. 12-13.

² 'Each one [instance in any series of instances of a phenomenon: 'fluctuations, crises, booms, depressions'] is a historic individual and never like any other, either in the way it comes about or in the picture it presents' (Schumpeter, op. cit., vol. i, p. 34).—A.J.T.

³ According to Pigou, op. cit., p. 11, industrial fluctuations became oecumenical in their range from about A.D. 1872 onwards. 'Bare as they are and short their span, the annals reveal a secular trend towards territorial expansion of business relations and a concomitant trend towards economic unity', and this both within the United States and in the World at large, according to Mitchell, *ibid.*, p. 446. Cp. p. 456.—A.J.T.

⁴ Rostow, W. W.: *British Economy of the Nineteenth Century* (Oxford 1948, Clarendon Press), pp. 31-32.

⁵ 'The swings of the different industries are not independent. . . . They are concordant in direction. We may fairly speak of common swings of expansion and contraction in the main body of industries taken separately, and not merely in the aggregate or average of industries. But . . . the amplitudes of the swings in different occupations are very far from concordant; some are much larger than others' (Pigou, A. C.: *Industrial Fluctuations*, 2nd ed. (London 1929, Macmillan), p. 13).—A.J.T.

⁶ Burns, A. F., and Mitchell, W. C.: *Measuring Business Cycles* (New York 1946, National Bureau of Economic Research, Inc.), p. 488-91.

duration of their component phases; they differ in industrial and geographical scope; they differ in intensity; they differ in the features which attain prominence; they differ in the quickness and the uniformity with which they sweep from one country to another. . . . [But] differences among business cycles . . . afford no reason for doubting that these cycles constitute a valid species of phenomena.¹

'A tendency toward alternations of prosperity and depression must have considerable constancy and energy to stamp its pattern upon economic history in a world where other factors of most unequal power are constantly present. . . .² The quiet business forces working towards uniformity of fortunes must be powerful indeed to impress a common pattern upon the course of business cycles in many countries.'³

These findings reappear in a judicious surveyor's panoramic view:

'Each cycle, each period of prosperity or depression, has its special features which are not present in any, or not in many, others. In a sense, each cycle is an historical individual: each is embedded in a social-economic structure of its own. Technological knowledge, methods of production, degree of capital-intensity, number, quality, and age-distribution of the population, habits and preferences of consumers, social institutions in the widest sense including the legal framework of Society, practice in the matter of interventions of the State and other public bodies in the economic sphere, habits of payment, banking practices and so forth—all these factors change continuously and are not exactly the same in any two cases. . . .

'This . . . raises the question whether it is possible to make any general statements at all as to the causes and conditions of cycles—in other words, whether the same theory holds for the cycles in the first half of the nineteenth century and for those in the second quarter of the twentieth century, for the cycles in the industrial countries of Western Europe and the United States and for those in the agricultural countries of Eastern Europe and overseas. . . .

'We believe . . . that a very general theory of the most important aspects of the Cycle can be evolved, which will not on the one hand be so formal as to be useless for practical purposes, while, on the other hand, it will have a very wide field of application. . . . The mere fact that each cycle is an historical individual is not a sufficient argument against a general theory. Are there two men who are in all respects alike? Does this dissimilarity in many respects destroy the possibility and practical usefulness of Anatomy, Physiology, etc.? That each cycle is unique in many respects does not prevent all cycles from being similar in other respects, over and above those similarities which constitute the fundamental elements of the Cycle.'⁴

In this summing up, certain salient features emerge. Three points are picked out by A. C. Pigou:⁵ 'the first general characteristic of industrial fluctuations is their wide international range; the second, the rough similarity among successive cycles; the third, the general concordance in timing and direction between the wave movements of different occupations.' W. C. Mitchell's first and last word is that 'business history repeats

itself, but always with a difference', which does not, however, make the search for uniformities either impracticable or useless.¹ Considering the paucity of the data at the inquirers' disposal so far, it was not surprising to find that some of the four or five different kinds of cycles which different investigators had claimed to have discovered should have been less widely accepted than others as being proven historical realities, or that there should have been still undecided controversies over many points concerning even those kinds of cycles that had won recognition by a general consensus of authoritative scholars; the remarkable and significant features in the history of a still adolescent Modern Western economic science had been the boldness with which a band of intellectual pioneers had made use of the still scanty data at their disposal for hazarding generalizations, and the extent of the fundamental agreement underlying their superficial domestic quarrels. The attitude prevalent among economists mid-way through the twentieth century is made clear in the following passage of a letter, dated the 2nd December, 1949, from Professor T. S. Ashton to the writer of this Study in answer to inquiries on these points:

'There is no doubt whatsoever of the existence of what may reasonably be called a trade or business cycle in the nineteenth century: all are agreed on that. It is equally clear that the booms and slumps occurred at the same time, or almost the same time, in all industrialised countries and in the less developed areas connected with these by trade. The only dispute is as to the periodicity.'

Of the four or five kinds of cycles in view, the best established at the time of writing seemed to be one with a wave-length of something between 11 and 7 years² or something between 10 and 7 years;³ of 9.4 years reckoning from peak to peak (between the dates A.D. 1792 and A.D. 1913), and 9 years reckoning from trough to trough (between the dates A.D. 1788 and A.D. 1914), in a series discernible in the economic history of Great Britain;⁴ and of 9.2 years on the average.⁵

A cycle with a wave-length of about four years on the average had been described, by at least one observer, alternating with the nine-year cycle in Great Britain during the first phase of her Industrial Age; but, in this observer's view, these four-years cycles 'tend virtually to disappear from the array of trade cycles [in the history of Great Britain] after 1860', except for a special case in A.D. 1907;⁶ and he accounts for this progressive submergence of four-years cycles by nine-years cycles in Great Britain

¹ See Mitchell, W. C.: *Business Cycles and their Causes*, being a new edition of the author's *Business Cycles, Part III* (Berkeley, Cal. 1941, University of California Press), pp. ix-xi.

² See Hawtrey, op. cit., p. 476.

³ Professor T. S. Ashton in a personal letter of the 2nd December, 1949, to the writer of this Study. In this letter, Professor Ashton draws attention to 'clearly marked booms in England in 1818, 1825, 1836, 1845, 1856, 1866, 1873, 1882, 1889/90, 1899/1900, 1906, 1913, and so on'. According to Mitchell, *Business Cycles, The Problem and its Setting*, p. 334, 'the memorable cycles which culminated in 1882, in 1893, in 1907, in 1917 and in 1920 stand out clearly in all our curves'.

⁴ See Rostow, op. cit., p. 38, n. 1.

⁵ See Huntington, E.: *Mainsprings of Civilisation* (New York 1945, Wiley), p. 477. The cycle of this wave-length had been first brought to light by Clément Juglar in *Des Crises Commerciales et de leur Retour Périodique* (Paris 1892, Guillaumin, et aux États-Unis 1st ed.: Paris 1862, Guillaumin; 2nd ed.: Paris 1882, Guillaumin).

⁶ Rostow, op. cit., pp. 38-39.

by interpreting the four-years cycle as an 'inventory cycle' whose 'character stems from the nature of the merchant's trade', and 'which one could, almost certainly, trace back into the eighteenth century, and perhaps even back to mediaeval times'.¹ He points out 'that, until about the [eighteen-] fifties, the principal British exports were consumers' rather than capital goods',² but that, 'from the late 1780's at least, . . . this rhythm is woven into the longer and deeper rhythm of fluctuations in long-term investment',³ and that the sixth decade of the nineteenth century marks the date at which, in the economic life of Great Britain, long-term investment in capital goods supplanted the production of consumers' goods as the country's major economic activity.⁴ 'The two types of fluctuations', however, 'did not pursue their course in separate and discrete channels. They were linked in at least four ways.'⁵

Students of the economic history of the United States in the Industrial Age had here described a cycle with a wave-length of 42 or 43 months on the average.⁶

'The average (and the model) American cycle seems to be made up of two unequal segments, a two-year period of gradually increasing activity, and a period, four to six months shorter, of less gradually shrinking activity.'⁷

The same school of American investigators had seen in this three-and-a-half-years cycle in the United States one local variant of a kind, likewise exemplified in the four-years cycle in Great Britain, of which there were other local variants to be found in the contemporary economic histories of France, Germany, and Austria⁸—the chronological locus of this short-wave cycle lying within minimum and maximum limits of three and six years.⁹ On the other hand, in the opinion of a Belgian scholar,

'Pour qui dépasse le cadre de l'histoire des États-Unis, la distinction entre le cycle de sept à dix ans et le cycle court de quarante mois ne trouve plus aucun semblant de confirmation dans les faits: le cycle de quarante mois n'existe simplement pas.'¹⁰

A British scholar,¹¹ who likewise discounts, as being dubious, the evidence for the existence 'of a purely commercial short wave of about 3½ years', also makes the same reservation of judgement about the evidence for the existence 'of longer waves of from 20 to 80 years' duration'. 'Long cycles of remarkably regular duration'—with a chronological locus between minimum and maximum limits of fifteen and twenty years—were described nevertheless, by some investigators, in the history of building construction in the United States;¹² and, in the general economic history of Great Britain between A.D. 1790 and A.D. 1914, five phases of an average wave-length of just under twenty-five years were described by one of the investigators already quoted.¹³

¹³ See Rostow, *op. cit.*, p. 7.

These economic cycles of the order of magnitude of about a quarter of a century, which W. W. Rostow detects in a British setting, are articulated by him as follows:

(i) A.D. 1790-1815: A war-period of economic stagnation and of decline in real wages.¹

(ii) A.D. 1815 to the end of the eighteen-forties: 'This was the period when the rates of increase in industrial production were at a maximum for the whole era to A.D. 1914';² and it was also a period in which 'real wages rose for a rapidly expanding population'.³

(iii) The end of the eighteen-forties to A.D. 1873: A war-period, gold-mining period, and railway-building period.⁴

(iv) A.D. 1873-1900: A counterpart of Period (ii), with a tendency, in investment, to concentrate on openings at home.⁵

(v) A.D. 1900-14: A counterpart of Period (iii), with a corresponding spurt in gold-mining and a tendency to invest abroad in economically virgin fields.⁶

It will be seen that the last four of these five phases of an average wave-length of just under 25 years coalesce into a pair of still longer cycles, one taking fifty-eight years (A.D. 1815-73) and an at least partially repetitive successor taking forty-one years (A.D. 1873-1914) if the year 1914 is to be regarded as marking this second cycle's close.

A chronological pattern not unlike that described by W. W. Rostow in the history of Great Britain between the years A.D. 1790 and 1914 had been described by A. Spiethoff in the contemporary history of the Western World as a whole during the years A.D. 1822 to 1913 inclusive, where the German investigator finds four phases of an average wave-length of twenty-three years, articulated as follows:⁷

(i) A.D. 1822-42: on the whole, depressed.

(ii) A.D. 1843-73: on the whole, prosperous.

(iii) A.D. 1874-94: on the whole, depressed.

(iv) A.D. 1895-1913: on the whole, prosperous.

It will be noticed that in Spiethoff's geographically wider vista, as in Rostow's geographically narrower one, there are four phases of an average wave-length of not much less than a quarter of a century⁸ coalescing into a pair of longer cycles which, on Spiethoff's reckoning, take respectively fifty-two years (A.D. 1822-73 inclusive) and forty years (A.D. 1874-1913 inclusive).

The pair of cycles of an average wave-length of about half a century, which emerges from Spiethoff's and from Rostow's vista alike, represents a long-wave kind of cycle which was described independently by a couple of Dutch scholars—J. van Gelderen, who published his findings in A.D. 1913, and G. de Wolff, who endorsed van Gelderen's findings in

⁵ Ibid., p. 25.

⁶ Ibid., p. 26.

⁷ As summarized in Habeler, G.: *Prosperity and Depression: A Theoretical Analysis of Cyclical Movements*, 3rd ed. (Geneva 1941, League of Nations), p. 273. See also Schumpeter, op. cit., vol. i, p. 164.

⁸ A twenty-five-years cycle was described by S. S. Kuznets as well (see Mitchell, *ibid.*, p. 226, and S. S. Kuznets himself in his *Secular Movements in Production and Prices* (New York and Boston, 1930, Houghton Mifflin)).

A.D. 1924¹—and by a Russian scholar, N. D. Kondratieff, who published his own findings in A.D. 1926.² Kondratieff articulates his long-wave cycles as follows:³

	<i>Trough</i>	<i>Crest</i>	<i>Trough</i>	<i>Total duration</i>
(i)	<i>circa</i> 1790	1810-17	1844-51	50/60 years
(ii)	1844-51	1870-75	1890-96	40/50 years
(iii)	1890-96	1914-20		

An attempt to correlate these forty/sixty-years 'Kondratieff cycles' with the nine/ten-years 'Juglar cycles' and the three-and-a-half-years 'Mitchell cycles' had been made by J. A. Schumpeter.⁴ His suggestion was that each 'Kondratieff cycle' was a clutch of six 'Juglar cycles', and each 'Juglar cycle' a clutch of three 'Mitchell cycles'.

'We . . . postulate that each Kondratieff should contain an integral number of Juglars, and each Juglar an integral number of Kitchins.⁵ The warrant for this is in the nature of the circumstances which give rise to multiplicity. If waves of innovations of shorter span play around a wave of a similar character but of longer span, the sequences of the phases of the latter will so determine the conditions under which the former rise and break as to make a higher unit out of them, even if the innovations which create them are entirely independent of the innovations which carry the longer wave. . . . For every time series the sweep of any cycle is the trend of the cycles of next lower order. . . . The three deepest and longest depressions of the Industrial Age—1825-30, 1873-8, 1929-34—were depressions in the cycles of all three wave-lengths alike. . . . Barring very few cases in which difficulties arise, it is possible to count off, historically as well as statistically, six Juglars to a Kondratieff and three Kitchins to a Juglar—[and this] not [just] as an average, but in every individual case.'⁶

Schumpeter's hypothesis had not, however, won the support of W. C. Mitchell.

'No arrangement of our monthly measures in groups of three consecutive cycles will produce an approximation to "Juglar cycles" of from nine to ten years.⁷ . . . The evidence is better that business cycles vary substantially within periods of "Juglar cycles" than that they do so within the long-cycle periods.⁸ . . . The trough dates of the "Juglar cycles" correspond roughly to the trough dates of severe business depressions.'⁹

But, in the estimation of W. C. Mitchell and his colleague A. F. Burns, it remained still an open question whether 'the periods separating severe depressions are genuine cyclical units,'¹⁰ while the same two investigators' judgement on the 'Kondratieff cycles' was that the evidence told, on balance, against their claim to be realities.¹¹

⁹ *Ibid.*, p. 448.

¹⁰ *Ibid.*, p. 464. Cp. p. 460.

¹¹ See *ibid.*, p. 465.

It will be seen that the believers in the three-and-a-half-years cycle and the believers in the nine-years cycle were each sceptical about the reality of the others' article of faith, and that both schools alike were still more sceptical about the reality of the 'Kondratieff cycle' with a reputed wave-length of about fifty years. At the same time it will be realized that, midway through the twentieth century, the data were still scanty indeed; for, even if the earliest occurrences of the phenomena themselves were anterior to the last decade of the eighteenth century, there was at any rate no adequate evidence for them earlier than that date; and it is manifest that, within the span of 160 years running from A.D. 1790 to A.D. 1950, there had not been time for the completion of more than forty-five three-and-a-half-years cycles, more than seventeen nine-and-one-fifth-years cycles, or more than three fifty-years cycles. Even if the count of instances of the shortest and therefore most numerous represented of these three kinds of cycles were to be multiplied by reckoning as so many separate data the simultaneous epiphanies of one and the same occurrence in different geographical provinces of the Western World, the total number would still stand in three figures.

'In the sense in which the term is used here—recurrences of prosperity, recession, depression, and revival in the business activities of countries taken as units—the total number of past business cycles may well be less than a thousand. For business cycles are phenomena peculiar to a certain form of economic organisation which has been dominant even in Western Europe for less than two centuries, and for briefer periods in other regions. And the average cycle has lasted five years, if we may trust our data. Of the whole number of cases to date, the 166 cycles we have measured form a significant fraction. . . . We should be glad to have a larger sample; but the present one constitutes an appreciable fraction of its "universe".'¹

The exiguousness of the quantity of data obtainable during the first half of the twentieth century for the investigation of business cycles even of the shortest wave-lengths had deterred investigators from attempting to apply to fluctuations in economic human activities a method of 'periodogram analysis' that had been found to work in the natural sciences. In the, so far, brief history of an Industrial Western Society the series were still too short; it was still uncertain whether these series were strictly periodic; and it was also still uncertain whether, if there were genuine periodicities, these were maintaining themselves over long enough periods for 'periodogram analysis' to be feasible.² Yet, short of going to these mathematical lengths, the investigators of business cycles resorted to mathematical devices that would have horrified any conventionally heterodox contemporary Western historian.

"The procedure adopted in ascertaining secular trends is usually empirical in high degree. Starting with a time series plotted to convenient scale on a chart, the statistician seeks to find for that one series, within the period covered by his data, the line which best represents "the long-time tendencies" shown by the plotted curve. . . . The technical process usually

¹ Mitchell, W. C.: *Business Cycles, the Problem and its Setting* (New York 1930, National Bureau of Economic Research, Inc.), pp. 395-6 and 397.

² See Mitchell, *ibid.*, pp. 259-60.

consists in (1) fitting a "mathematical curve" (for example, a straight line or a third-degree parabola) to the data, or to the logarithms of the data, by the method of least squares or of moments; (2) computing moving or progressive arithmetic means or moving medians, including in the averages whatever number of items seems to give satisfactory results; (3) first computing moving averages and then fitting trend lines to the results; (4) drawing a free-hand curve through the data representing the investigator's impression, formed from careful study, of the long-time tendency; or (5) using ratios between the paired items of series which are believed to have substantially the same secular trends.¹

The pioneers of a Western economic science had the courage of their convictions, and they were justified in their faith that economic history must make sense by the validity and the value of the intellectual results that they achieved by staking their intellectual fortunes on the rationality of their hypothesis and pushing their interrogations of the data to the third degree.

(c) 'LAWS OF NATURE' IN THE HISTORIES OF CIVILIZATIONS

1. *Struggles for Existence between Parochial States*

The War-and-Peace Cycle in Modern and post-Modern Western History

If, without taking our eyes off the Modern and post-Modern chapters of the history of the Western Civilization, we now focus them on the political, instead of the economic, plane of activity, we shall see that, in an epoch in which the outstanding economic phenomenon was the epiphany and dissemination of Industrialism, the outstanding political phenomenon was the earlier epiphany of a Balance of Power between parochial states and the progressive inclusion of an ever widening circle of states within the field of force governed by this unitary system of inter-state power politics.

The Modern Western political Balance of Power resembled its younger contemporary the Modern Western industrial economy not only in tending to expand progressively over an ever wider geographical area, but also in exhibiting a cyclic rhythm in its history. Alternating phases of war and peace were the political counterparts of alternating phases of economic prosperity and depression; and a confrontation of the political with the economic series of fluctuations in Modern Western history threw fresh light on those cycles with wave-lengths of about twenty-five years, and double cycles with wave-lengths of about half a century, for which the economic evidence was so inadequate that the more cautious economic investigators had returned verdicts of 'non-

¹ Mitchell, W. C.: *Business Cycles, the Problem and its Setting* (New York 1930, National Bureau of Economic Research, Inc.), p. 213, in chap. iii: 'The Contribution of Statistics', iii: 'The Analysis of Time Series', 3. 'The Problem of Secular Trends', (1) 'The Empirical Approach to the Problem'. Schumpeter (*Business Cycles*, vol. i, pp. 200-5), declares himself sceptical of 'fitted trends' except in so far as these follow a lead given by an empirical investigation of the historical facts. 'Trend analysis by means both of smoothing and of fitting may, from additional theoretical and historical information, derive a right of existence not naturally or generally its own' (p. 203). 'Such trends [as autonomous changes in taste, such as occurred with respect to alcoholic drinks or heavy foods] can in no case be found by formal methods' (p. 205).

proven' on these longer cycles' claims to be economic realities.¹ The political evidence bore out the view, entertained by judicious economic inquirers,² that the apparitions of economic 'long waves' might not be hallucinations but might be economic reflections of political realities that had already been 'a going concern' in the Modern Western World for some three hundred years before the outbreak of the Industrial Revolution in Great Britain.³ In any case, whatever the political cycles' relations to the economic cycles might eventually prove to be, there were indications that the political cycles, like their economic counterparts, were changing in character in accordance with a secular trend. Recurrent Western wars, for example, were, as we shall see, apparently becoming progressively shorter and sharper, while conversely the alternately recurrent spells of peace in Western political history had, as we shall also see, tended to occupy a progressively greater aggregate number of years in each successive peace-and-war cycle down to the outbreak of the general war of A.D. 1914-18, though at the same time these progressive chronological gains for Peace at War's expense were being offset by a progressive aggravation of the economic, the political, and (above all) the spiritual devastation produced by wars when these did recur.

In studying the evidence for the currency of 'laws of Nature' in the economic affairs of a latter-day Western Society, we have noticed that inquirers who believed such laws to be both current and ascertainable were also aware that their validity was confined to a monetary and industrial economic régime which had not established itself, even in its birthplace in Great Britain, before the later decades of the eighteenth century and which might be expected eventually to pass out of existence after an ephemeral appearance, and a still briefer oecumenical ascendancy, on the stage of History.⁴ At the time of writing, mid-way through the twentieth century, the Balance of Power had had a longer innings than Industrialism had had so far in the history of the Western Civilization, since the epiphany of the Modern Western Balance of Power had been coeval with the opening of the modern chapter of Western history in the last quarter of the fifteenth century, some three hundred years before Industrialism had made its appearance. On the other hand a mortality which, in the history of Western industrialism, was at this time still no more than an academic expectation, was perhaps already asserting its dominion over the Balance of Power between parochial Western states.

A post-Modern Age of Western history which had opened in the seventh and eighth decades of the nineteenth century⁵ had seen the rhythm of a Modern Western war-and-peace cycle broken, in the course of its fourth beat, by the portent of one general war following hard at the heels of another, with an interval of only twenty-five years between the outbreaks in A.D. 1939 and in A.D. 1914, instead of the interval of 120 years or more which had separated A.D. 1914 from A.D. 1792 and A.D. 1792 from A.D. 1672. In the histories of civilizations that were already

¹ See pp. 230-2, above.

² For example, by W. W. Rostow, in the passage cited on p. 231, above.

³ See pp. 286-7, below.

⁴ See pp. 224-6, above.

⁵ See I. i. 1, n. 2.

extinct, so that the twentieth-century Western historian had the advantage there of knowing the whole story, such 'non-stop' recurrences of major wars had been apt to portend historic catastrophes. When, in the second chapter of Hellenic history, the Decelean War of 413-404 B.C. had followed the Archidamian War of 431-421 B.C. after an interval of only eight years, the consequence of this Atheno-Peloponnesian double war had been the breakdown of the Hellenic Civilization. When the Hannibalic War of 218-201 B.C. had followed the First Romano-Punic War of 264-241 B.C. after an interval of only twenty-three years, the consequence of this Romano-Punic double war had been the first relapse of a broken down and disintegrating Hellenic Society after its first rally.¹ When the Great Romano-Sasanian War of A.D. 603-28 had followed the Great Romano-Sasanian War of A.D. 572-91 after an interval of only twelve years, the consequence had been the obliteration of a frontier between an Hellenic universal state and recalcitrant Iranian Power which, reckoning from the date of its original establishment by the Roman empire-builder Pompey in 64 B.C., had maintained itself for all but seven hundred years by the time when the momentary restoration of the territorial *status quo ante bellum* in A.D. 628 was undone, once for all, by an explosion of Primitive Muslim Arab military force that completed the liquidation of a post-Alexandrine Hellenic ascendancy south of Taurus and re-established in the shape of an Arab Caliphate the Syriac universal state which Alexander had overthrown in the shape of an Achaemenian Empire.

At a moment in the post-Modern chapter of Western history at which the denouement of the double Germano-Western War of A.D. 1914-18 and A.D. 1939-45 was not yet an accomplished fact, the approaching overturn of a Balance of Power which had maintained its precarious existence since its inauguration in the last decade of the fifteenth century had already been announced by a rise in the death-rate of Western or Westernizing Great Powers that had been as steep as it had been sudden; and this carnage was ominous, considering that the first law of every balance, political and physical alike, is that the instability of the equilibrium varies in inverse ratio to the number of its *points d'appui*. While a two-legged stool, chair, or table would be doomed by the impracticability of its construction to fall over in a trice, a three-legged stool is capable of standing by itself, though a corpulent sitter would rest more securely on a four-legged chair and a careful housewife would prefer a six-legged to a four-legged table for carrying a display of her best china. Since politics are never static but are always dynamic, an apter analogy from the chances and changes of physical life is to be found in the superiority of a tricycle over a bicycle as a mount for a rider who finds difficulty in keeping his balance, and the superiority of a six-wheeled omnibus over a four-wheeled car as a vehicle for traversing the sands of the desert. In the light of these homely physical analogies, the rise and decline in the number of Western or Westernizing Great Powers between A.D. 1552 and A.D. 1952 was politically most significant.

From the first epiphany of a Modern Western system of international

¹ See V. vi. 290-1.

relations at the close of the fifteenth century down to the outbreak of the General War of A.D. 1914-18 more than four hundred years later, the precariousness of the international equilibrium in the political life of the Western World had been progressively reduced by a gradual increase in the number of participant Powers of the highest calibre.

In the first bout of Modern Western wars (*gerebatur* A.D. 1494-1559), in which the original constellation of Modern Western Great Powers had crystallized out of a Late Medieval nebula surrounding the city-state cosmos in Northern Italy, Southern and Western Germany, and the Netherlands, there had been a phase (*durabat* A.D. 1519-56)—and this the decisive phase—in which only two Powers of the very highest calibre had been face to face; and this preliminary duel between Valois and Hapsburg, which was the overture to the rhythmic fluctuations of a Balance of Power in the subsequent course of Western political history, was, in the last analysis, a civil war between Valois and Valois,¹ since, in this chapter of Hapsburg history, the heart of the Hapsburg Power was that portion of the heritage of the Burgundian-Valois Duke Charles the Bold which Charles' Hapsburg son-in-law Maximilian I had managed to retain in A.D. 1477-82 for his Burgundian-Valois wife Mary, and to retrieve in A.D. 1493. This Burgundian nucleus of the dominions of a Hapsburg great-grandson and namesake of Charles the Bold who happened to be King of Castile and Aragon² and subsequently Holy Roman Emperor,³ as well as Count of an Imperial Burgundy and a French Flanders,⁴ was the heart which pumped out the life-blood that nourished the Hapsburg Power's sinews of war; and, if Charles V's treasury and arsenal were thus French in their provenance in virtue of being furnished by a Flanders that was a French county, his court was French in its culture in virtue of having been moulded in the tradition of a Burgundy that was a French duchy.

The Burgundian-Valois House had been founded by an act of the French Crown as recently as A.D. 1363, when King John of France had conferred on his fourth son Philip the Bold a Duchy of Burgundy which had escheated to the French Crown through the extinction, in A.D. 1361, of the dukes of the Capetian French line; and the fortunes of this newly endowed Burgundian cadet branch of the House of Valois had been made by Philip the Bold's marriage in A.D. 1369 with the reigning Count of Flanders' daughter and heiress Margaret; for Flanders was a fief of the French Crown that was still more important than Burgundy; and this matrimonial alliance had resulted, on the death in A.D. 1384 of Margaret's father, Count Louis II of Flanders, without male heirs, in the union of the French fief of Burgundy with the French fiefs of

¹ See Fueter, E.: *Geschichte des Europäischen Staatensystems von 1492-1559* (Munich and Berlin 1919, Oldenbourg), pp. 101-3, for the thesis that the fundamental cause of conflict in this cycle was not a rivalry between the two national states of France and Spain. Fueter suggests that, after Francis I's victory over the Swiss at Marignano on the 13th-14th September, 1515, Spain might have acquiesced in a partition of Italy between herself and France if the union of the crowns of Castile and Aragon with the Hapsburg-Valois Power in A.D. 1516 had not resulted in the subordination of Spanish interests to Burgundian interests in the determination of the foreign policy of Charles V.

² Since the 23rd January, 1516.

³ Since the 28th June, 1519.

⁴ Since the 5th January, 1515.

Flanders, Artois, Nevers, and Rethel and the Imperial County of Burgundy into the bargain.¹

The duel between Royal French Valois and Burgundian Ducal French Valois who were thinly disguised under a Hapsburg Imperial mask did not, however, result in a reunion of these two branches of the House of France which, in the political circumstances of the Western World of the day, would have brought with it a political reunification of Western Christendom under the oecumenical rule of a resuscitated Carolingian Empire; and, in proving to have been at least an 'undecisive contest', if not a 'temperate' one,² this opening round in a rhythmical series of Modern and post-Modern Western wars justified the inauguration of a Balance of Power involving the Western World as a whole³ if the value of this political device is to be measured by its capacity to obtain for a society a maximum amount of political decentralization and maximum degree of cultural diversity at a minimum cost in terms of political friction and military conflict. Thereafter, as the further fluctuations of this Modern Western Balance followed their rhythmic course, they long continued on the whole to serve the interests of a *Homo Occidentalis* who was at once their perpetrator and their victim, if we may find an index of their beneficence in the concomitant net increase in the number of participant Great Powers from the figure of two, at which it had stood on the eve of the abdication of Charles V in A.D. 1555/6, to the figure of eight, at which it stood in A.D. 1914.

In the course of those three centuries and a half, the number of Great Powers in the Western World had gradually risen. It rose from two to three through the fission of the Burgundian-Valois-Hapsburg Power into a Spanish Hapsburg Monarchy and a Danubian Hapsburg Monarchy after the abdication of Charles V in A.D. 1555/6,⁴ and then, during

¹ The Imperial County of Burgundy (Franche-Comté) had been inherited in A.D. 1347 by Jeanne, the wife of Count Louis II of Flanders and the daughter of another Jeanne who had been the wife of King Philip V of France and the daughter of Count Otto IV of Franche-Comté. Philip of France had married this older Jeanne in A.D. 1307, ten years before he himself had come to the French throne in A.D. 1317, and Franche-Comté had thus temporarily fallen into the possession of the French Crown; it had then passed into the hands of the Capetian duke of the French Duchy of Burgundy, Odo IV, in A.D. 1330 through his marriage with Margaret, the daughter of Jeanne the elder and sister of Jeanne the younger; thereafter, in A.D. 1347, it had been inherited by Jeanne the younger upon Duke Odo IV of Burgundy's death; and, through Jeanne the younger, it was subsequently inherited by her daughter Margaret upon the death of Jeanne the younger's husband and Margaret's father, Count Louis II of Flanders, in A.D. 1384.

² See Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, chap. xxxviii, *ad finem*: 'General Observations on the Fall of the Roman Empire in the West'.

³ A local Balance of Power, involving the city-states of Northern and Central Italy, had been in operation during the last half of a millennium running from the death of the Holy Roman Emperor Frederick II in 1250 to the invasion of Italy by King Charles VIII of France in A.D. 1494.

⁴ The first step towards the construction of a Danubian Hapsburg Monarchy had been taken as early as A.D. 1522, when, by a treaty signed at Brussels on the 7th February of that year, Charles V had invested his brother Ferdinand with a regency over the hereditary possessions of the House of Hapsburg. The second step had been taken in A.D. 1526, when the Crowns of Hungary and Bohemia had been conferred on Ferdinand after the Hungarians' disastrous defeat by the 'Osmanlis' at Mohacz (see II. ii. 177-9). The third step was taken when Ferdinand was elected Holy Roman Emperor, in succession to Charles V, on the 28th February, 1558.

The separate existence of a Spanish Hapsburg Monarchy may be dated from Philip II's succession to Charles V in A.D. 1556 in Spain and in the Burgundian dominions, which were thereby reduced to the status of Spanish dependencies.

the first of the regular cycles of war-and-peace in this series (*currebat* A.D. 1568–1672), the number rose again from three to five through the successful self-assertion of a United Northern Netherlands that had broken out of the Spanish Monarchy and a Sweden that had broken out of the Danish Monarchy.

During the second of these three regular cycles (*currebat* A.D. 1672–1792) the number threatened to fall as sharply as it had risen during the preceding cycle; for Spain, as well as the Netherlands and Sweden, now proved unequal to staying the course, while the sixteenth-century fission of the Hapsburg Power into a Spanish and an Austrian branch came into danger of being neutralized by an eighteenth-century union of the Spanish Monarchy with France to create a Bourbon Power which, in the hands of Louis XIV, would have outclassed all the other Powers of the Western World as decidedly as the undivided Hapsburg Power had outclassed its French rival before the abdication of Charles V. None of these possibilities, however, materialized; for the replacement of a Hapsburg by a Bourbon dynasty at Madrid did not, after all, 'abolish the Pyrenees';¹ a Bourbon Spain remained at least as separate from a Bourbon France after A.D. 1713 as a Hapsburg Spain had been, since A.D. 1556, from a Hapsburg Austria; and the casualties among the parvenues 'just-great' Powers were made good by replacements. A United Kingdom of England and Scotland took the place of a United Netherlands who had exhausted herself in winning a General War of A.D. 1672–1713 in which she had been the protagonist in the anti-French coalition; Prussia took the place of a Sweden who had exhausted herself in waging the Northern War of A.D. 1700–21; and, though an eighteenth-century Spain who succeeded in retaining her independence did not succeed in becoming a Great Power again, this gap in the ranks of the Great Powers of the Western World was filled by the enlistment of an Orthodox Christian Russia whose decisive victory over Sweden had demonstrated the effectiveness of her reception of the Western Civilization, at any rate on the military plane.

During the third cycle (*currebat* A.D. 1792–1914) a number which had thus remained constant during the seventeenth and eighteenth centuries at the figure of five was raised once more, and this time from five to eight, by the successive additions of a United Italy, a United States of North America, and a Westernizing Japan. A nineteenth-century Italy attained the stature of a 'just-great' Power that had been attained by a seventeenth-century Holland and Sweden. A twentieth-century Japan won her spurs by defeating Russia, as an eighteenth-century Russia had won hers by defeating Sweden. The United States emerged through a fission of an eighteenth-century British Empire which ultimately had the same effect of making two Great Powers out of one as the fission of the Hapsburg Power after the abdication of Charles V, though the secession of the United States from the British Empire was achieved by the force of arms with which Sweden and the United Netherlands had

¹ 'Il n'y a plus de Pyrénées' was Louis XIV's comment on the accession of his grandson to the throne of Spain in A.D. 1700 according to Voltaire, *Le Siècle de Louis Quatorze*, chap. 28.

won their independence from Denmark and Spain, and not by the pacific and amicable process through which the Danubian and the Spanish Hapsburg Monarchy had parted company.¹

Thus, on the eve of the outbreak of a General War of A.D. 1914-18 which was to open the fourth regular cycle in the series, it looked, in the light of the experience of the past 350 years, as if the current Balance of Power in the Western World had ensured its own perpetuation for an indefinite time ahead by progressively increasing the number of the bases on which it rested and if it had come to stand steadily upon eight legs instead of shakily upon two; and this appearance of security was enhanced by the spectacle of a row of ninepins standing in between the legs; for the increase in the number of Great Powers in the Western system of international relations between A.D. 1556 and A.D. 1914 had been accompanied by an increase *pari passu* in the number of 'buffer states' on which the mutually frustrating jealousies of rival Great Powers around them had bestowed an independence that these pigmies would have been incapable of either winning or keeping by force of their own arms. Such 'buffer states' had emerged and survived in so far as the balanced pressures of their powerful neighbours upon one another had happened to create and preserve here and there some nook or cranny in which a militarily impotent minor state could nestle and thrive like a rock-plant in an interstice between the rugged faces of the untooled stones in a wall of cyclopean masonry.²

The United States, for example, in her military and political infancy, had been able to win her independence in the war of A.D. 1775-83 in North America thanks to a temporary neutralization of British sea-power by French sea-power, and had then been able to expand westwards across the Continent by securing the reversion of the Mississippi Basin through the Louisiana Purchase thanks to a preponderance of British sea-power over French sea-power in the General War of A.D. 1792-1815 which had made it impossible for Napoleon to take delivery for France of a Transatlantic territory which he had compelled Spain to retrocede to France on paper. The Latin American republics, in their turn, had owed their independence to a mistrust of the Continental European Powers that had moved Great Britain to co-operate with the United States by tacitly putting the sanction of British sea-power behind President Monroe's announcement of his doctrine on the 2nd December,

¹ The first step in the rise of the United States to the rank of a Great Power was the winning of her independence in the Revolutionary War of A.D. 1775-83. The second step was the development of her potential strength through the political acquisition and economic exploitation of a trans-continental territory (a stage corresponding to the geographical expansion of the Danubian Hapsburg Power in and after A.D. 1526). The third step was the maintenance of the Union by force of arms in the Civil War of A.D. 1861-5 (to which the counterpart in Hapsburg history was the Thirty Years War of A.D. 1618-48). The fourth step was the victory of the United States in the Spanish-American War of A.D. 1898, which drew the United States out of a political isolation that she had been maintaining since A.D. 1783, and involved her in commitments overseas.

² This generation of minor states as a by-product of the pressures exerted by rival Great Powers upon one another, when these pressures neutralize one another, is an outcome of the Balance of Power which has been noticed in this Study already, apropos of the emergence of the city-states of Northern and Central Italy in an interstice between the Holy Roman Empire and the Hildebrandine Papacy (see III. iii. 345-6; IV. iv. 524; and p. 294, below).

1823, in order to make sure that the current insurrections in the Spanish American Empire against the Spanish Crown should not end in a re-establishment of Spanish rule there through the arms and under the aegis of the Powers of the Holy Alliance. The Monroe Doctrine had prescribed that American communities which had declared and maintained their independence were not to be allowed to fall again under the control of any European Power; and, since at the time there were no Great Powers in the Western system of international relations that were not located in Europe, the Monroe Doctrine had been tantamount to a declaration that no Great Power was to be allowed to profit by the break-up of the Spanish Empire in the Americas. It was because the United States was not yet either able or willing to play the part of a Great Power in the European cockpit of Western power politics¹ that the Great Powers of the day acquiesced in her purchase, in A.D. 1803, of Louisiana from France; in her veto, in A.D. 1823, on the entry of any Great Power into the political vacuum created by the collapse of Spanish rule in the Americas; and in her annexation of the northern fringe of the former Spanish dominions in North America, from Texas to California inclusive, after waging a victorious war of aggression against the Spanish Empire's local successor-state, Mexico, in A.D. 1846-7.

A principle thus first established in Western history in respect of the Americas was promptly applied in the Near and Middle East when, on the morrow of the General War of A.D. 1792-1815, 'the Eastern Question' became interwoven with the older strands of Western diplomacy. The break-up of the Ottoman Empire, like the break-up of the Spanish Empire, created a political vacuum that would have been dangerous for the preservation of peace if the Great Powers had engaged in a scramble for Ottoman spoils with an eye to a competitive self-aggrandizement; and, just because this risk of a disturbance of the existing balance might have been impossible to counteract by any means less drastic than a resort to war, it was prudently parried by the concerted institution of a Near Eastern equivalent of the Monroe Doctrine which was none the less efficacious for not being explicitly enunciated.

The measure of the efficacy of this tacit Near Eastern Monroe Doctrine in practice is given by the contrast between the respective destinies of the territories lost by the Ottoman Empire after the year A.D. 1815 on the one hand and before that date on the other hand. While the Ottoman Empire's territorial losses between A.D. 1815 and the final débâcle in A.D. 1918 were far larger than the losses between the turn of the tide in Ottoman-Occidental relations in A.D. 1683 and the end of the Western General War of A.D. 1792-1815, the amount of ex-Ottoman territory that passed under the sovereignty of Western or Westernizing Great Powers in the course of the later of these two periods was trifling compared to the extent of the gains made by the same Powers at Ottoman expense between A.D. 1683 and A.D. 1815. After A.D. 1815 the only gains made by

¹ In the message in which President Monroe warned the Great Powers off the former Spanish dominions in the Americas, he was careful to assure them, in the same breath, that the policy of the United States in regard to Europe was one of benevolent non-interference.

Great Powers at the Ottoman Empire's direct expense¹ were the acquisition of the tiny Caucasian districts of Akhaltzik and Akhalkalaki after the Russo-Turkish War of A.D. 1828-9 by Russia² and the acquisition of Qars-Ardahan-Batum, Bosnia-Herzegovina, and Cyprus by Russia, Austria-Hungary, and Great Britain respectively after the Russo-Turkish War of A.D. 1877-8. All other territories lost by the Ottoman Empire after A.D. 1815 went to the making of the national states of Greece, Serbia, Rumania, Bulgaria, and Albania. The Hapsburg Monarchy did not even reacquire a Northern Serbia and a Western Wallachia that it had held from A.D. 1718 to A.D. 1739. By contrast, the territories permanently lost by the Ottoman Empire between A.D. 1683 and A.D. 1815³ had all been acquired by one or other of the two adjoining Great Powers in the Western system. Between those two dates the Danubian Hapsburg Monarchy had acquired the whole of the Ottoman portion of Hungary and Croatia, together with the Bukovina, and Russia the whole northern and north-eastern hinterland of the Black Sea, from the east bank of the Pruth to the south bank of the Rion, that had formerly lain under Ottoman sovereignty or suzerainty.

These clusters of newly created minor states on the American and the Near Eastern fringes of the Western World were not, however, such remarkable by-products of a latter-day Western Balance of Power as the states of the same small calibre that emerged or survived nearer to the centre of the system, where the political pressure was more severe. The classic case here was the success with which, from A.D. 1667 to A.D. 1945, first France and then Germany had been prevented from acquiring the Southern Netherlands by coalitions of Powers which had taken up arms to preserve the sovereignty of Spain, Austria, and Belgium in turn over this small but strategically important piece of territory. A corresponding play of the Balance of Power had enabled Portugal in the seventeenth century to anticipate the Spanish American countries' nineteenth-century achievement of breaking away from Spain, and had enabled Spain herself, as well as the United Netherlands and Sweden, in the eighteenth century to retain her independence after she had fallen out of the ranks of the Great Powers. On the eve of a General War of A.D. 1914-18 which was to open with Germany's unprovoked violation of the neutrality of Belgium, the existence of nine small neutral states in Western Europe—the three Low Countries, the three Scandinavian Countries, the two Iberian Countries, and Switzerland—looked like an even better augury for the future maintenance of a Western Balance of Power than the existence of eight Great Powers in the World at large at the same date.

Thus, at the time by when the Western Balance of Power had been 'a going concern' for rather more than four hundred years, the international

¹ The North African territories which France and Great Britain respectively brought under their control between A.D. 1830, the date of the beginning of the French conquest of Algeria, and A.D. 1881-2, which witnessed the establishment of a French protectorate over Tunisia and a British military occupation of Egypt, had already ceased to be Ottoman *de facto*, though they were still Ottoman *de jure*.

² See IX. viii. 193, n. 1.

³ The Morea, which was conquered from the Ottoman Empire by Venice in and after A.D. 1684, had been reconquered in A.D. 1715.

outlook wore a deceptively promising appearance. Even if, as was being prophesied by the more sensational-minded publicists at the turn of the nineteenth and twentieth centuries, a Danubian Hapsburg Monarchy that had prolonged its life by coming to terms with Magyar nationalism in the Austro-Hungarian *Ausgleich* of A.D. 1867 were nevertheless to break up, after the death of the venerable King-Emperor Francis Joseph, under the pressure of Slav national movements which the partial settlement of A.D. 1867 had left unsatisfied, the effect on the general system of international relations in the Western World that was expected to follow from a local Danubian débâcle was merely a reduction of the number of the Great Powers from eight to seven. In A.D. 1912 even the boldest prophet would not have dreamed of forecasting that by A.D. 1952 the number would have been reduced, as it actually had been, from the figure of eight which it had reached at the turn of the nineteenth and twentieth centuries to the figure of two at which it had stood between A.D. 1519 and A.D. 1556;¹ yet this drastic reduction had taken place within a span of thirty-two years running from A.D. 1914 to A.D. 1945 inclusive.

The break-up of the Danubian Monarchy, which had duly resulted from the General War of A.D. 1914-18, had proved in the event to be only the first of half a dozen casualties. On the morrow of the General War of A.D. 1939-45 a Prussia-Germany which had gone from strength to strength, until she had come, twice in one life-time, within an ace of conquering the World, now lay not only prostrate but partitioned, with her eastern frontier pushed back westwards to the line at which it had stood eight hundred years earlier.² In Germany's Assyrian fate an Israelite prophet would have seen God's judgement on Germany's Assyrian crimes of deliberately inflicting on Mankind, twice in one life-time, the awful sufferings of a general war and cold-bloodedly violating, in the course of her two orgies of aggression, the neutrality of seven out of those nine West European minor states whose immunity from the blood-tax that was the price of counting as a Great Power had been the touch-stone of the moral worth of a latter-day Western system of international relations. Milder chastisements had requited the punier outrages committed by a National-Socialist Germany's accomplices, Italy and Japan; but the death that had likewise been the fate of the other Great Powers who had been less guiltily involved in the Western general wars of A.D. 1914-18 and A.D. 1939-45 could not be interpreted so convincingly as having been the wages of sin.³ Great Britain and France, as well as Italy and Japan, had failed to stay the course, as the Netherlands and Sweden had failed two hundred years earlier, though the British Empire, like Prussia-Germany, had grown, during the two hundred years ending in A.D. 1914, to a stature at which these two Powers had

¹ The undivided Hapsburg Power which Charles V had held together before his abdication in A.D. 1555/6 had come into his hands by successive steps during the years A.D. 1515-19. On the 5th January, 1515, he had inherited the Kingdom of France; on the 23rd January, 1516, he had succeeded King Ferdinand as King of Aragon and Castile; on the 12th January, 1519, he had succeeded Maximilian I as ruler of the hereditary dominions of the House of Hapsburg; on the 28th June, 1519, he had succeeded Maximilian I as Holy Roman Emperor.

² See II. ii. 169.

³ Rom. vi. 2.

latterly overshadowed all the rest, while France had held the same position of pre-eminence from A.D. 1648 to A.D. 1815.

In A.D. 1952 the Soviet Union and the United States alone were still standing erect; and from a strategico-political standpoint the respective stances of these two Powers *vis-à-vis* one another were reminiscent of those of France and the Burgundian-Hapsburg Power some four hundred years earlier. In an arena which had expanded in the meanwhile beyond the bounds of Western Europe till it had come to be co-extensive with the entire surface of the planet, a prize that had expanded *pari passu* beyond the bounds of Italy, until it had come to embrace the whole of the Old World outside the limits of Russia's present domain, was being contended for in A.D. 1952 between a Russia which enjoyed the advantages of interior lines, compact metropolitan territory, and centralized autocratic government, once enjoyed by France, and a United States whose overwhelming superiority in aggregate strength on paper, when the assets of her dependencies and her allies were added to her own, was largely offset in practice, like the strength of the Count-King-Emperor Charles V, by the liabilities that these assets brought in their train and by the wide dispersion of the scattered territories and populations whose resources America had to defend in order to be able to draw upon them. It was easier for a twentieth-century Russia, as it had been for a sixteenth-century France, to take her adversary by surprise, in making sudden sorties in divers directions, than it was for a twentieth-century United States to mobilize her own and her friends' forces effectively for the arduous task of containing her adversary all the way round a line of circumvallation which, scale for scale, was proportionate in its length to the line which Charles V had once set himself to hold. The strategico-political bearings of a confrontation of two Great Powers, and two only, were thus much the same *circa* A.D. 1952 as they had been *circa* A.D. 1552. Yet, in these geographically similar circumstances, the Western Balance of Power's expectation of life was, for ideological reasons, decidedly less promising in the twentieth century than it had been in the sixteenth.

If the division of power in the Western World between no more than two competitors during the years A.D. 1519-55 had resulted, not in an increase in the number from the dual to the plural but in the reduction of a duality to a unity, the most likely way in which this unification would have been achieved would have been through the negotiation of one more felicitous dynastic marriage; and, even if a miscarriage of matrimonial diplomacy had made it impossible to avoid resorting to the barbarous alternative of unification through force of arms, the unifying war would still have been a temperate one, like those 'undecisive contests' through which the number of the Great Powers was, not diminished, but augmented in the course which history actually took during the three centuries and a half running from A.D. 1556 to A.D. 1914. The Royal French Valois and the Imperial Burgundian Valois were divided by nothing more serious than a dynastic rivalry that could have been removed painlessly by a marriage and almost painlessly by a conquest. They were not estranged from one another by any impassable gulf of incom-

patible religious or ideological faith or practice, such as had come, by A.D. 1952, to be fixed between the U.S.S.R. and the U.S.A.

It is true that the ostensible point of difference between the twentieth-century American and the twentieth-century Russian *Weltanschauung* and way of life was not insuperable; for ostensibly the two Powers were at issue over the question of the ratio in which private economic enterprise and public economic enterprise ought to stand to one another in a predominantly industrial society; and this was a question to which the correct answer could not be any absolute 'right or wrong' or 'yes or no', but only an arguable and adjustable 'more or less'. In every phase of every civilization known to History, the economy had always been a combination of public with private enterprise in proportions that had varied continually in response to changes in the social circumstances; the determination of the best mixture for meeting the practical needs of a particular time and place was a question, not of principle touching the religious foundations of life, but of expediency in regulating its economic surface; and, if this had really been all that was at issue between the United States and the Soviet Union in A.D. 1952, their conflict need have been no more tragic than the quarrel between the Burgundian ducal branch and the French royal branch of the House of Valois. The duel in A.D. 1952 was more formidable than the duel in A.D. 1552 because in A.D. 1952 the ostensible economic issue, which was no more serious in itself than the dynastic issue had been, masked a moral issue between the principles and practice of a Totalitarian Autocracy on the one hand and those of a Parliamentary Democracy on the other, in which the then still unanswered question

utrorum ad regna cadendum
Omnibus humanis esset terrâque marique¹

was a matter of life and death for every living human being.

Thus the reversion of the number of Great Powers in a latter-day Western international arena from a maximum figure of eight to a previous figure of two, after a run of some four hundred years of precariously maintained equilibrium between a larger number of gladiators, was an indication that the cyclic rhythm, which was the first law governing this international balance of political power, was itself governed by an overriding law that convicted this system of mortality—as the gyrations that keep a spinning top temporarily in balance are subject to an oscillatory movement that inclines farther, with each gyration, until at last it brings the gyrations to a stop by bringing the top to the ground. This diagnosis was confirmed by other symptoms which pointed the same way as the drastic reduction in the number of the Great Powers between A.D. 1914 and A.D. 1945. All these symptoms, taken together, suggested that the cyclic rhythm which had been keeping the political Balance of Power going during the Modern and post-Modern chapters of Western history was being accompanied by a secular movement that was working steadily towards an eventual overturn of the unstable equilibrium between a plurality of parochial states and towards the replacement of this by an at

¹ Lucretius: *De Rerum Naturâ*, Book III, ll. 836-7.

least temporarily stable oecumenical régime in which political power would be a monopoly administered from some single centre.

On a political plane which was the field of cycles of war and peace, as on an economic plane which was the field of 'booms' and 'slumps', the strength of this secular tendency towards integration was indicated by the failure of a concomitant tendency towards geographical expansion to counteract it. By A.D. 1952 the world-wide extension of the tentacles of a Western Industrial System of Economy that had made its epiphany in Great Britain during the later decades of the eighteenth century had been matched by the attraction of all the states then still surviving on the surface of the planet into a Western system of international relations that had made its epiphany in the last decade of the fifteenth century as a local West European political vortex round the nucleus of a Late Medieval city-state cosmos in Italy. In A.D. 1952 the prize at stake in the contest between the United States and the Soviet Union was nothing less than the command over all other habitable lands and navigable sea-routes and airways; and the General War of A.D. 1939-45 had been already 'global', and no longer merely 'European'; for in this war the battlefields had not been confined to a Lombardy and a Flanders that had been the cockpits of latter-day Western warfare during its overture and its first three regular cycles (*currebant* A.D. 1494-1914), and had not been confined, either, to the wider Continental European arena of the General War of A.D. 1914-18, with its western front stretching from the North Sea to the Alps and its eastern front stretching from the Baltic to the Carpathians. The General War of A.D. 1939-45 had been literally 'a world war' in which one battlefield embracing Europe, the Mediterranean, and the Eastern Atlantic had been matched by another embracing the Western Pacific and the Far East.

This twentieth-century integration of international relations all round the globe into a single system, centring on a Balance of Power that had originated in Western Europe and had then progressively brought the rest of the Earth's surface within the field of its magnetic attraction, presented a striking contrast to the configuration of the field of force in earlier chapters of the same story. The overture (*currebat* A.D. 1494-1559) had ranged no wider than the areas involved in a competition for hegemony over Italy between nascent adjoining Great Powers in the Transalpine and Transmarine provinces of Western Europe; and even Flanders had then been only a secondary theatre of military operations, though the two Great Powers of the day actually marched with one another there, without being insulated on this front by any intervening political vacuum or buffer. The civil war between Catholics and Protestants in France (*gerebatur* A.D. 1562-98) went on its way more or less independently of the contemporary civil war between Dutch and Spaniards in the Spanish Hapsburg Monarchy (*gerebatur* A.D. 1568-1609). The civil war in England (*gerebatur* A.D. 1642-8) likewise followed its own course without becoming implicated in the contemporary civil war in the Holy Roman Empire (*gerebatur* A.D. 1618-48). The Americas and the Indies were drawn into the main vortex of Western warfare only in the course of the first regular cycle (*currebat* A.D. 1568-1672); and,

though during the second regular cycle (*currebat* A.D. 1672-1792) the decisive military operations on Flemish and Lombard battlefields were usually accompanied by 'side-shows' in North America and in Continental India in which the same belligerents were engaged, the synchronization of the local conflicts in the West European and the overseas theatres of war was still inexact. As often as not, the eighteenth-century campaigns on American and Indian soil would open later or earlier and close later or earlier than the corresponding campaigns in Western Europe, so that there were years in which France and Great Britain were at war with one another in Europe while at peace with one another overseas, or conversely at war overseas while at peace in Europe.¹

As for the wars which the eastern border-states of the Western World were waging with a Muscovite Orthodox Christian Power in the continental hinterland of the Baltic, and with an Ottoman Iranic Muslim Power in the Danube Basin and the Mediterranean, these sequels to the Crusades were at first carried on in virtual independence of the Western Powers' fratricidal warfare with one another. The move made by France in A.D. 1534-62 to redress the balance between herself and the Hapsburg Power by allying herself with the Hapsburgs' Ottoman adversary was an obviously expedient application of a Machiavellianly rational statecraft which struck a contemporary Western Christian public, including the French themselves, as being so shocking that France forebore to follow this policy up, notwithstanding the importance of the military and political advantages that she stood to gain by it and the extremity of the straits in which she found herself at the time;³ and, as late as A.D. 1664, Louis XIV gave precedence to the oecumenical interests of Western Christendom over the parochial interests of France when he permitted French volunteers to help a rival Western Power in the shape of the Danubian Hapsburg Monarchy to stem an Ottoman invasion whose success would have been advantageous to France on a Machiavellian reckoning.⁴ France did not exploit, as she could have done, the predica-

¹ For example, in the General War of A.D. 1672-1713 the respective war years were 1672-8, 1688-97, 1702-13 in Western Europe; 1690-7, 1702-10 in North America. In the epilogue to the General War of A.D. 1672-1713 the respective war years were 1733-5, 1740-8, 1756-63 in Western Europe; 1744-63, 1775-83 in North America; 1746-9, 1750-4, 1758-61, 1778-83 in India.

The synchronization of the local conflicts continued to be inexact in the third regular cycle (*currebat* A.D. 1792-1914). In the General War of A.D. 1792-1815 the respective war years were 1792-1802, 1803-14, 1815 in Europe; 1812-14 in North America; 1799-1805, 1816-18 in India. In the epilogue to the General War of A.D. 1792-1815 the respective war years were 1848-9, 1859, 1864, 1866, 1870-1 in Europe; 1861-7 in North America (taking account of the French expedition to Mexico, 1862-7); 1838-42, 1843, 1845-6, 1848-9, 1857-9, 1878-81 in India; 1839-41, 1853-6, 1875-8, 1882, in the Near and Middle East.

² In May 1534 France made a treaty with the Ottoman Corsair Khayr-ad-Din Barbarossa; in February 1536 she made a commercial treaty with the Porte that served as a cloak for a political entente.

³ See Fueter, E.: *Geschichte des Europäischen Staatensystems von 1492-1559* (Munich and Berlin 1919, Oldenbourg), pp. 47-49. There was no sequel to the Franco-Ottoman combined naval operations of A.D. 1543/4, in which an Ottoman fleet was harboured in the French naval base at Toulon.

⁴ A regular French expeditionary force, as well as a flow of French volunteers, came to the aid of the Venetians in A.D. 1668-9 during the last agonies of the siege of Candia, but this French support of Venice against the 'Osmanlis was less meritorious than the French support of the Danubian Monarchy against the same assailant, considering that Venice, unlike the Danubian Monarchy, could not be regarded by France at this date as

ment of a Hapsburg Power that was implicated in Western Christendom's border warfare with the 'Osmanlis as well as in the Hapsburgs' family quarrel with France; and, thanks to this French forbearance, whether it was deliberate or inadvertent,¹ the Danubian Hapsburg Monarchy, throughout the sixteenth, seventeenth, and eighteenth centuries, usually found itself able to avoid simultaneous engagements on its French and on its Ottoman front.

The same policy of limiting her military liabilities to a single front at a time was followed by Russia after she had become implicated in the Western Balance of Power at the turn of the seventeenth and eighteenth centuries; and, until after the close of the General War of A.D. 1792-1815, the insulation of the vortex round the frontier between Western Christendom and the Ottoman Empire from the vortex in the interior of the Western World usually proved to be practical politics. 'The Eastern Question' began to enter into the Western Balance of Power only when Napoleon's failure to expand a French ascendancy over the debris of a Medieval city-state cosmos into a French ascendancy over the whole of a Modern Western and Westernizing World² left a victorious Russia and a victorious Great Britain free to pursue a rivalry with one another in the Near and Middle East.

Even the vortex round the frontier between Western Christendom and Russian Orthodox Christendom did not coalesce completely with the vortex in the interior of the Western World till more than a hundred years after the date of Peter the Great's victory at Poltava in A.D. 1709 over Charles XII of Sweden. It was not so surprising that, before Russia had been received into the Western Society as a result of Peter's life-work, the Great Northern War of A.D. 1700-21 should have been waged without becoming implicated in the Western World's General War of A.D. 1672-1713, just as the Great Northern War of A.D. 1558-83 had been waged without being implicated either in the last cadences of the overture (*currebat* A.D. 1494-1568) to a latter-day Western series of cycles of War and Peace or in the first cadences of the first regular cycle in this series (*currebat* A.D. 1568-1672). It was more remarkable that the partitions of Poland-Lithuania in A.D. 1772-95 between Russia and the two eastern march-Powers of the Western World, and also even Russia's acquisition of Finland from the Scandinavian march-State of the Western World in the Russo-Swedish war of A.D. 1808-9, should still have taken place in the margin, and not in the centre, of the Western system of international relations. It is true that Russia was a belligerent in the Seven Years War from A.D. 1756 to A.D. 1762, and that her withdrawal from this war in A.D. 1762 may have marked a turning-point in the fortunes of Frederick the Great. Yet the first Western general war in which Russia played a principal part was the war of A.D. 1792-1815, and

a rival Power, while on the other hand the French might have hoped, if their intervention against the 'Osmanlis at Candia had been successful, to enter into Venice's heritage in at least a remnant of her dominion in Crete.

¹ According to Fueter, *op. cit.*, p. 48, no special consideration was shown to the Danubian Hapsburg Monarchy or to Venice by other states of the Western comity in return for the public service which these two anti-Ottoman march-states were performing for Western Christendom as a whole.

² See V. v. 619-42.

even in this war it was not till A.D. 1812 that Russia's role came to be a decisive one. On the other hand, from A.D. 1812 onwards down to the War of A.D. 1939-45 inclusive, there was no general war in the Western World in which the part played by Russia was not one of first-class importance. There were, however, down to the eve of the outbreak of the General War of A.D. 1914-18, still certain local wars—fought in outlying regions only recently incorporated into a Westernizing World—which followed independent courses of their own without being drawn into the central vortex of the Western Society's international relations. The Russo-Japanese War of A.D. 1904-5 was one case in point; the Spanish-American War of A.D. 1898 and the British-Afrikaner War of A.D. 1899-1902 were two other instances.

The geographical expansion of an originally West European system of international relations to a world-wide range had not, however, sufficed to counteract the play of a centripetal force that, since A.D. 1914, had made itself felt by reducing the number of the Great Powers in this system from eight to two; and this carnage revealed a secular tendency in the history of a latter-day Balance of Power in the Western World for this unstable equilibrium, fluctuating in recurrent cycles, to bring about its own eventual overturn through the inversion of a competition into a monopoly. This tendency might prove to be no peculiar feature either of this Western political balance or indeed of political balances as a species of the generic social structure represented by any Balance of Power between any competitors.

'The experiences of our age refute the notion, which has been governing people's thinking for more than a hundred years past, that a Balance of Power between freely competing units—be these states, businesses, artisans or what you will—is a system that can maintain itself in this condition of unstable equilibrium for an indefinite length of time. To-day, as in the past, this state of equilibrium in a competition that is free from monopolistic restrictions has a nusus to pass over into some form of monopoly or other.'¹

This nusus was presumably traceable in the last analysis to the working of some law of human dynamics that came into play wherever and whenever a balance of human forces had been set up on any plane of social activity; where the plane of activity was politics and the parties to the encounter were parochial states, the particular mode of this general law's operation was a matter of common knowledge.

The difficulty of maintaining in perpetuity a political Balance of Power between parochial states was due, at bottom, to the sinfulness of the vein of Human Nature that was the raw material of statesmanship. In politics, men and women who in other walks of life might be conscientious workmen, faithful friends, and devoted parents were apt to behave as idolatrous tribesmen; and, in their worship of their tribal idols of collective power, pride, passion, prejudice, and covetousness, they were prone to break moral laws that they would never have dreamed of breaking, and to perpetrate crimes that they would never have dreamed

¹ Elias, N.: *Über den Prozess der Zivilisation*, vol. ii: *Wandlungen der Gesellschaft: Entwurf zu einer Theorie der Zivilisation* (Basel 1939, Haus zum Falken), p. 436.

of perpetrating, in their private affairs. This immoral temper was not an auspicious psychological setting for the execution of the delicate and laborious task of constantly adjusting a balance in answer to constant changes in the relative strengths of parties whose strengths were bound to change in virtue of their being, not inanimate objects, but living creatures. The tribesmen of a tribe that had forged ahead of its neighbours in population, wealth, technique, or other constituent elements of military and political power were apt to yield to the temptation to try to take advantage of their relative gain in collective strength in order to make a bid for collective aggrandizement; and such criminally childish collective ambitions were not easily discouraged by merely diplomatic counter-measures. When the parties whose interests were threatened by the baleful rise of a new Mars in the international constellation had resorted to the crude device of a reversal of alliances and the subtle device of a general self-denying ordinance binding all Great Powers alike to abstain from competing for the spoils of some derelict empire, there were not many other pacific cards left in a diplomatist's hand; in the history of every political Balance of Power between parochial states whose story was on record, it had invariably proved to be beyond the resources of Diplomacy to save the balance from being overturned without at least an occasional recourse to inter-state war; and the institution of War, which was, itself, an outcome and expression of the tribal spirit, had proved, time and again, to be unamenable to rational regulation and control and, when out of control, to be destructive.

War had proved to be deadly, not only for a political Balance of Power that it had been called in to redress, but also for the civilization in whose body politic the maintenance of a balance was being attempted; and this destructiveness of War was not just incidental to its clumsiness, but was inherent in its nature. A collectively organized resort to violence was, indeed, so rough and ready a method of attempting to adjust a political balance that, even when successfully used to restore equilibrium in one quarter, it usually also had the effect of producing a new derangement of the balance in some other quarter. A diplomatist driven to resort to War *faute de mieux* was in the unhappy quandary in which a watch-maker would find himself if he were instructed to mend a broken watch and were given no tools for doing the job except a sledge-hammer. War was, however, also destructive in its essence, quite apart from the incongruousness of its diplomatic use, and its destructiveness tended to grow greater progressively, at each fresh hammer stroke. The toll taken by War tended to rise with the passage of Time because, in any society in which War was an established institution, the service of Mars was apt to be the first charge on the society's energies; and the maintenance of a competition by means of War, in default of Diplomacy, between parochial states was therefore apt to drive the competing military Powers into devoting to War an ever increasing proportion of their strength. Even while a society was still in growth, the increase in the demands made by War would thus outstrip the increase in the society's capacity to satisfy them; the rate of the blood-tax would rise with every improvement in the technical ability to mobilize the society's non-human and

human resources; and, even when the mounting strain of War had produced a social breakdown, a still belligerent society would still continue to devote to War an increasing proportion of a strength that would now be, not increasing, but diminishing.

In an earlier context¹ we have watched the Hellenic Civilization following this fatal road during its disintegration, and in that instance we know what fate it was to which an unconscionably belligerent society condemned itself. In the course of an Hellenic Time of Troubles the toll taken by War eventually rose to a height at which the Hellenic Society would have died, forthwith, of the mortal wounds that it had already inflicted on itself if the then imminent dissolution of the body social had not been postponed (without being ultimately averted) in consequence of a sudden overturn of the Balance of Power itself. In the Hellenic World within the fifty-three years 220-168 B.C. a Balance of Power between parochial states was inverted into a monopoly of power in the hands of a universal state through a swift succession of 'knock-out-blows' with which four out of five Great Powers were laid low by one victorious survivor.² This dramatic episode of Hellenic history bore an ominous likeness to the dramatic course of Western history since A.D. 1914; and both stories alike threw light on a mortality that seemed to be the inevitable doom of all Balances of Power.

While Balances of Power thus appear to be intrinsically unstable and transitory, it is still more clearly evident that they could not follow this secular course from their original installation to their eventual overturn if they were not kept going in the meanwhile, like spinning tops, by rhythmically alternating fluctuations. Our next task is therefore to analyse the regularly recurrent characteristics of the cycle as these present themselves in Modern Western, post-Alexandrine Hellenic, and post-Confucian Sinic history, and to put our analysis to an empirical test by identifying the successive occurrences of the operation of this cyclic 'law of Nature' in a Western, an Hellenic, and a Sinic international arena.

Considering the dominance of the part played by War in the working of a political balance among parochial states, it is not surprising to find that the most emphatic punctuation in a uniform sequence of events recurring in one repetitive cycle after another is the outbreak of a great war in which one Power that has forged ahead of all its rivals makes so formidable a bid for world dominion that it evokes an opposing coalition of all the other Powers implicated in this particular system of international relations.

The storm that thus breaks in the form of 'a general war'—as we may conveniently label a great war of the all-engulfing kind just indicated—has usually been brewing in the course of a spell of fair weather following the calming down of the last preceding atmospheric disturbance. The derangement of an established equilibrium that is registered so sensationally in the outbreak of a general war is usually the cumulative outcome of gradual processes of growth, decay, and divers other forms

¹ In III. iii. 150.

² See the quotation from Polybius in III. iii. 312-13, and also IV. iv. 210-14.

of change that Life is always experiencing in Time. An equilibrium retrospectively designed to serve as a response to one particular set of already past challenges is thus virtually bound, with the sheer passage of Time, to fall farther and farther out of gear with current facts and needs, as these change in the flow of the Time-stream; every one of these changes adds to the mounting strain on the established equilibrium by increasing the discrepancy between an Epimethean dispensation and a Promethean reality; and, while it may be arguable that the consequent tension would never have exploded into a general war, but for the disproportionate increase in the relative strength of one of the Great Powers, it will usually also be arguable that the aggressor would never have ventured to challenge his peers for the prize of world dominion if he had not been able to count on reinforcing his own strength, and masking the egotism of his own ambitions, by presenting himself as the champion of other forces which could likewise claim that an antiquated equilibrium was no longer giving them fair play.

The storm in which this cumulative tension eventually discharges itself sometimes breaks unheralded from a clear sky. Sometimes, on the other hand, it is preceded by premonitory showers that are ominous for observers who have eyes to see. A burst of short local minor wars is a characteristic prelude to a general war, though it is not a symptom that invariably displays itself.

When, with or without such a prelude, a general war does break out, its immediate outcome is apt to be negatively decisive without being positively constructive. The outstanding direct result is usually the defeat of the arch-aggressor; but, in this act of the play, he is apt to be temporarily foiled rather than permanently ham-strung or sincerely converted to a good-neighbourly state of mind and feeling; and the other, perhaps ultimately more important, problems that had found no solution within the framework of the old order are now apt to be shelved, rather than solved, in a patched-up peace that is improvised primarily in order to meet the urgent immediate need for giving the society a rest in which it may recover from its exhaustion.

Even if the urgency of restoring peace for its own sake did not thus force the peace-negotiators' pace, they would, no doubt, find it difficult or impossible to map out a blue print for the summary and comprehensive solution of problems that were not open to being solved either all at once or all in the council-chamber. The passage of Time, which, in the spell of peace preceding the general war, had malefically created intractable problems by turning an accomplished settlement into an anachronism, now beneficently ripens these still unsolved problems to a point at which a solution of them at last becomes attainable. Yet, even when Time is thus working to facilitate Diplomacy, instead of working, as before, to aggravate the difficulties of the statesman's task, Diplomacy once again proves incapable of doing its job without again employing the instrument of War to carry its policy over the stiles of collective obtuseness and inertia. A spell of peace that gives a war-stricken society the necessary breathing-space is therefore apt to be followed by a further burst of warfare over the still unsettled issues on which the recent

general war was fought; but this martial epilogue to a general war usually differs auspiciously from the antecedent general war itself in producing more constructive and more lasting solutions for the social problems with which both these bouts of warfare are concerned, and in achieving this at a lower cost in terms of destruction and exhaustion.¹

Though this martial aftermath of a general war usually outclasses the martial prelude to the general war in its scale, it also usually resembles the prelude in taking the form of a burst of short wars, some, at least, of which are only local, in contrast to the protractedness and the ubiquity that are a general war's characteristically noxious features; and, though the peace-settlements following these supplementary lesser wars may be partial and piecemeal by comparison with the grand essay in comprehensive and definitive peace-making after the antecedent general war,² their aggregate effect is often to find more or less adequate and enduring solutions for the problems which have precipitated the general war and which have been left still unsolved by the abortive peace-making after it. Thereby the disturbed equilibrium is temporarily restored by more positive measures than the mere frustration of a single Great Power's bid for world dominion that is the negative achievement of the opposing coalition in a general war. For this reason the interval of general peace that elapses between the constructive settlement achieved in the martial epilogue to a general war and the outbreak of another general war as the result of the ultimate explosion of gradually pent up new forces is more genuinely peaceful, and hence also more creative, in its quality, even when it is not longer in its duration, than the breathing-space between the end of a general war and the beginning of its martial epilogue.

The foregoing analysis has brought to light the composition and structure of the uniform sequence of events constituting one war-and-peace cycle in a repetitive series of cycles of the kind. The uniformly recurring sequence consists of alternating bouts of War and spells of Peace; there are four of these altogether, namely two of each, but these couples are not pairs of twins; for, in both the couple of spells of Peace and the couple of paroxysms of War, one of the two beats is more sharply accentuated than the other. The tranquillity of the interval of general peace following the martial epilogue to a general war presents as sharp a contrast to the uneasiness of the breathing-space between the

¹ This sequence of events is not, of course, invariable, and, even when it does duly present itself, it does not always conform exactly to the standard pattern delineated here. In Modern Western history, for example, the Thirty Years War (*gerebatur* A.D. 1618-48) did set the seal on the frustration, in the foregoing general war (*gerebatur* A.D. 1568-1609), of the Hapsburgs' bid for World dominion; but, at any rate in the Central European theatre of hostilities, this conclusive confirmation of a previous military and political decision took, not a lighter, but a heavier toll than the general war had taken. Similarly, in post-Alexandrine Hellenic history, the toll taken by the supplementary wars of 90-80 B.C. was greater in Italy—and indeed in the Aegean Basin as well—than the toll taken by the civil disturbances and social revolutions of 133-111 B.C., which had taken the place of a general war in this chapter of Hellenic history, as the civil wars in the Spanish Hapsburg Empire and in France had taken the place of a general war in the chapter of Western history within which the Thirty Years War fell.

² Here again the Thirty Years War presents an exception to the normal rule, inasmuch as the peace-settlement of Westphalia, by which it was followed, was actually the first Modern Western essay in peace-making on an oecumenical scale.

general war itself and its martial epilogue as the mildness of this epilogue presents to the severity of the antecedent general war.

Now that we have plotted out the typical physiognomy of a war-and-peace cycle, our next step must be to set out in tabular form¹ the successive occurrences of this sequence of phenomena in the Modern and post-Modern chapters of Western history.

This table shows that, in the course of the four and a half centuries that had elapsed between the last decade of the fifteenth century of the Christian Era, when this particular Balance of Power had been installed in the Western World, and the year A.D. 1952, the repetitive cycle through which a precariously unstable equilibrium had been turbulently maintaining itself had so far revolved five times over, counting in the overture to the series as well as the still uncompleted fourth round of the subsequent cycles. The table also shows that this fourth cycle, as well as the overture, had departed from the norm represented by the three regular cycles that had occurred between A.D. 1568 and A.D. 1914, and that, among these three, the second and the third cycle were closer replicas of one another than the first cycle was of either of them.

The departures of the overture and the fourth cycle from the norm were not of the same kind; for the fourth cycle differed from the overture and from the preceding three regular cycles alike in its structure, whereas the overture resembled the regular cycles in its structure and differed from them only in its wave-length.

The structural novelty of the fourth cycle was, as we have seen,² the portentous one of capping one general war with another one of still greater severity, atrocity, and inconclusiveness, instead of following it up with a burst of milder, but nevertheless more conclusive, supplementary wars that, on the precedent of the uniform sequence of events in each of the preceding cycles, were to be expected as the sequel to a breathing-space. There was no such radical difference of structure between the three regular cycles and the overture. In the overture, as in the regular cycles, a breathing-space after a general war had duly been followed by supplementary wars which had duly been followed, in their turn, by a general peace. The difference in this case was merely a chronological one. The overture's duration of seventy-four years (*currebat* A.D. 1494-1568) had been not much longer than the maximum wave-length of a single 'Kondratieff cycle' on the economic plane of latter-day Western history, and not quite so long as the sum of a couple of minimum wave-lengths of the same economic 'long cycle',³ whereas the duration of the second and third regular cycles (*currebant* A.D. 1672-1792 *et* A.D. 1792-1914), running, as it had done, to 120 years in the one case and 122 years in the other,⁴ had been equal to the sum of a couple of maximum 'Kondratieff'

¹ See Table I, opposite.

² On p. 235, above.

³ These 'Kondratieff cycles' with wave-lengths ranging between maxima of about sixty years and minima of about forty years have been noticed on pp. 231-2, above.

⁴ These are the respective wave-lengths found for Cycles II and III by measuring the intervals between outbreaks of general wars; and the durations of 104 years and 74 years, found for Cycle I and for the overture respectively, are obtained by measurements on the same basis. This basis is the obvious one to take, since the outbreaks of general wars are, as we have observed, the most emphatic of all the punctuations marking out the uniform sequence of events composing each of these repetitive cycles. An alternative

TABLE I. *Successive Occurrences of the War-and-Peace Cycle in Modern and post-Modern Western History*

Phase	Overture (A.D. 1494-1568)	First Regular Cycle (A.D. 1568-1672)	Second Regular Cycle (A.D. 1672-1792)	Third Regular Cycle (A.D. 1792-1914)	Fourth Cycle (A.D. 1914-)
(i) Premontory Wars (the Prelude)	1667-8 ¹	..	1911-12 ²

³ 1494-1503, 1510-16, and 1521-5.

⁴ 1568-1609 in the Spanish Hapsburg Monarchy; 1562-98 in France.

⁵ 1672-8, 1688-97, and 1702-13.

⁶ 1792-1802, 1803-14, and 1815.

⁷ 1536-8, 1542-4, [1544-6 and 1549-50, England v. France], [1546-52, Schmalkald League of Protestant Princes in the Holy Roman Empire v. Charles V], 1552-9.

⁸ 1733-5, 1740-8, and 1756-63.

⁹ 1848-9, 1853-6, 1859 [1861-5, civil war in the United States; 1862-7, French occupation of Mexico], 1864, 1866, and 1870-1.

¹⁰ This recrudescent general war of 1939-45 was heralded by a splutter of premonitory wars: the Japanese attack on China launched in Manchuria in 1931; the Italo-Abyssinian War of 1935-6; the War of 1936-9 in Spain; and the fateful one-day campaign in the Rhineland on the 7th March, 1936, which was to pay for its bloodlessness at compound interest in the holocausts of the years 1939-45.

wave-lengths, while the first regular cycle (*currebat* A.D. 1568-1672), with its duration of 104 years, had been equal to the sum of a couple of 'Kondratieff cycles' of average length.

It is also noticeable that the shortness of the total span of the overture by comparison with the spans of the three regular cycles was accounted for mainly by the abnormal shortness of its two spells of Peace, and that, by contrast, its two bouts of War were not appreciably shorter than those of the regular cycles. The breathing-space after the general war had lasted for 11 years in the overture, as compared with 9 years in the first cycle, 20 years in the second, and 33 years in the third; the general peace after the supplementary wars had lasted for 9 years in the overture, as compared with 24 years in the first cycle, 29 years in the second, and 43 years in the third. On the other hand the general war had continued for 31 years (A.D. 1494-1525) in the overture as compared with 41 years each (A.D. 1568-1609 and A.D. 1672-1713) in the first and second cycles, and 23 years (A.D. 1792-1815) in the third cycle, while the bout of supplementary wars had continued for 23 years (A.D. 1536-59) in the overture as compared with 30 years each (A.D. 1618-48 and A.D. 1733-63) in the first and second cycles and 23 years (A.D. 1848-71) in the third cycle.

Our table also brings out a tendency, which we have already noticed by anticipation,¹ for the number of war years in a cycle to diminish, and for the ratio between the numbers of war years and of peace years to change to the numerical advantage of the peace years, with each successive repetition of the sequence.

This tendency does not, it is true, pronounce itself so sharply when measured in terms of individual years as when measured in terms of the groups of years, representing alternate bouts of War and spells of Peace, into which the sequence has been analysed; for, though the overall length of the bout that we have labelled 'the general war' falls off strikingly from the figure of 41 years at which it stands in the first and second cycles to its 23 years in the third cycle and its 4 years in the fourth, these reductions of the span are partly offset by concurrent eliminations of intercalated peace years. No less than 15 peace years, for example, were intercalated in the general war of A.D. 1672-1713—consisting, as this did, of three constituent bouts separated by two truces lasting from A.D. 1678 to 1688 and from A.D. 1697 to 1702, whereas in the General War of A.D. 1792-1815 the truces following, in A.D. 1802-3, the abortive conclusion of peace at Amiens and preceding, in A.D. 1814-15, 'the Hundred Days' were matters, not of years, but of months, while the sole truce during the General War of A.D. 1914-18 was the fraternization on the first Christmas Day after the outbreak of hostilities. When, however, the overall figures have been duly corrected to allow for such intercalations of peace years and peace months, the tendency towards a diminution in the relative lengths of the war periods still stands out

basis would be to measure the intervals between restorations of general peace; and on this basis the length of Regular Cycle I would work out at 89 years (1559-1648), that of Cycle II at 115 years (1648-1763), and that of Cycle III at 108 years (1763-1871).

¹ On p. 235, above.

conspicuously in a comparison of the four-years' span of the General War of A.D. 1914-18 with the corrected figures of approximately 21 years for the General War of A.D. 1792-1815 and approximately 26 years for the General War of A.D. 1672-1713.¹

At the same time a synoptic view of the later and the earlier general wars in this Western series also shows that, in the act of becoming shorter, Western general wars had been becoming more concentrated, more intense, and more relentless, and that, so far from the progressive shortening of the lengths of bouts of general warfare signifying an alleviation of the scourge of War, the progressive concentration of general warfare within an ever smaller number of years at an ever higher degree of intensity had resulted in the recurrent general wars working greater havoc in the life of the Western Civilization than they had worked when they had been carried on more desultorily over longer Time-spans. While it was true that under this older dispensation the plague of War had been more or less endemic in the Western body social, it was also true that a relatively mild perennial malady was in many ways more tolerable and less dangerous than a series of occasional sudden violent epidemics breaking in upon spells of relatively good health. This abrupt alternation of Total War with Total Peace was, indeed, manifestly more trying to the constitution of Society than an earlier condition in which the difference between spells of health and bouts of sickness had been less sharply accentuated. In the Early Modern Age of Western history the war-ridden society had been affected like a victim of chronic malaria, whose vitality is permanently lowered by his complaint without his life being brought into jeopardy. In the Late Modern Age the Western Society had been relieved of its malaria thanks to a gratifying improvement in the day-to-day performance of Western political preventive medicine, but the patient had been made to pay for this rise in his normal level of health by becoming subject to thunderbolt 'strokes' which were as unpredictably sudden as they were lethally violent.

While the deadliness of War had thus been increasing by geometrical progression with each further repetition of a Western war-and-peace cycle in which the bouts of War had been becoming shorter, and the spells of Peace longer, every time, the respective stances of the competing Powers had been as uniform, throughout the series of recurrent cycles, as the sequence of events in which, cycle by cycle, the resolution of political and military forces had recurrently worked itself out.

We have already noticed² that the Western international tableau of

¹ The average figure for the length of time by which each successive Western general war was becoming shorter than its immediate predecessor thus works out at eleven years as between the latest three general wars in this series according to the corrected calculations of their spans. When the writer was doing this sum on the morning of the 2nd August, 1950, he had at his elbow his original notes, written in A.D. 1929; and, considering that at that date the possibility of constructing an atom bomb was still beyond the mental horizon of a layman like himself, he was startled to read in his own handwriting, jotted down twenty-one years ago: 'Since the General War of A.D. 1914-1918 lasted little more than four years, we find, on following out the progression, that the next general war, which might be expected to break out about A.D. 2035, would be instantaneous in duration, i.e. annihilating in effect. This mathematical fantasy is borne out by all the empirical evidence available for a forecast in this year A.D. 1929.'

² On p. 244, above.

A.D. 1952, in which the Soviet Union was striving to break out of a ring within which the United States was striving to contain her, was a reproduction of the tableau of A.D. 1552, with a twentieth-century Russia playing a sixteenth-century France's part and the United States playing Charles V's. We can now see that this disposition of forces was not peculiar to the situation existing at those two dates, at each of which the number of Great Powers had been no more than two. In every round with the sole exception of the first regular cycle (*currebat* A.D. 1568-1672), the aggressor Power had invariably been a continental Power in a central position occupying a compact territory with sally-ports opening into the back-yards of the countries that were the arenas of combat, the stakes of contention, and the prizes of victory.

In the overture (*currebat* A.D. 1494-1568) this role had been played by a France who marched with Italy along one land frontier and with Flanders along another; and, after a temporary eclipse that had been the penalty of her civil war of A.D. 1562-98, France had recaptured this role from a Spanish Hapsburg Monarchy that had acquired it, in France's temporary absence, during the General War of A.D. 1568-1609 which had inaugurated Regular Cycle I (*currebat* A.D. 1568-1672).¹ In the

¹ This General War of A.D. 1568-1609 took, like the contemporary warfare in France during the years A.D. 1562-98, the form of a civil war between conflicting local interests and religious persuasions as far as the two principal belligerents were concerned. This civil war between the Spanish Catholic and Dutch Protestant subjects of Philip II was converted into a general war by England's entry into the lists as one of Spain's adversaries. This English intervention gave an oecumenical significance to what would otherwise have remained a domestic conflict within the body politic of a single Great Power, because, if the Spanish Armada had conquered England in A.D. 1588 and had installed there a minoritarian Roman Catholic Government dependent on Spanish backing, this increase in the power of the Spanish Hapsburg Monarchy would presumably have ensured, not merely the eventual subjugation of the Protestant insurgents in the Netherlands, but the temporary supremacy of Spain in the Western international arena, since Spain would then have been able to take full advantage of the opportunity, offered to her by the civil war in France, for bringing France too under a Spanish hegemony through the agency of a Roman Catholic Government in France that would likewise have had to look to Spain for support.

The insurrection of the Netherlands against the Spanish Crown in A.D. 1568 and the increasing provocation of the Spaniards by the English in and after A.D. 1572 gave the measure of the temporary paralysis of French power during the French civil war of A.D. 1562-98. The inability of Spain to profit by the chance of winning world dominion, with which the temporary eclipse of France had presented her, gave the measure of Spain's intrinsic permanent weakness under her temporary outward appearance of strength. Whenever France was her normal mighty self, her neighbours Spain, the Netherlands, and England, none of whom was a match for France singly, had a strong interest in holding together against the Central Power that was a menace to all of them alike. The marriages between Henry VIII and Catharine of Aragon in A.D. 1509 and between Philip II and Mary of England in A.D. 1554—like the Anglo-Spanish combined military operations in the Iberian Peninsula in A.D. 1811-13—were the reflection of a community of Spanish and English interests that was normal until France fell out of the competition for world dominion after A.D. 1815; and it was a fatality that both these matrimonial alliances should have been exceptions to a rule which made the political felicity of Hapsburg—if not of Spanish—marriages proverbial.

An even greater portent, however, than the breach between England and Spain during the French civil war of A.D. 1562-98 was the alacrity with which the English and the Dutch fell out with one another over the scramble for Spanish and Portuguese spoils overseas, and the tardiness with which they eventually made up their minds to call a truce to their feud with one another in face of a menace from a rehabilitated France which was more dangerous for both of them than the menace from Spain had ever been. The treaty made by England with France on the 29th May, 1527, on the morrow of the crushing defeat of the French at Pavia on the 24th February, 1525, was not, on any Machiavellian reckoning, a precedent that could justify the treaty made on the 1st June, 1670, on the morrow of the French invasion of the Spanish Netherlands in May 1667.

general wars of A.D. 1672-1713 and A.D. 1792-1815 France had played the aggressor's part once again; but in the meantime a Western World that had been engaging in these domestic conflicts with one hand had been enlarging its territorial domain with the other hand; and this change in the Western World's geographical scale and structure had eventually deprived France of her central position.

France's last chance of winning world dominion had passed away at Waterloo upon the final failure of her third bid for it in the General War of A.D. 1792-1815. Thereafter the Western World's continental centre of gravity had shifted eastward from France to Germany as a result of the reception of the Western culture first in a Russian and then in an Ottoman Orthodox Christendom. These sweeping cultural conquests, which had carried the eastern marches of a Westernizing World as far as Alexandria and Vladivostok, had also substituted the Near and Middle East for Italy and Flanders as the arena in which the stakes were held, the wars were fought, and the prizes were to be won; and this transformation of the Western World's geographical landscape had been reflected on the political and military plane in the transfer of the role of aggressive Central Power from France to Prussia-Germany in the course of the supplementary wars (*gerebantur* A.D. 1848-71) following the General War of A.D. 1792-1815. Germany's tenure of a role which she had thus captured from France was, however, to be very much briefer

Though Louis XIV's premonitory attack on the Spanish Netherlands in A.D. 1667 had moved the United Netherlands and England to make peace with one another in that year and to enter into an anti-French triple alliance, including Sweden, in A.D. 1668, France nevertheless had England for her ally against Holland for the first three years (A.D. 1672-4) of a general war in which a French attack on the Dutch was the first move in a fresh French attempt to win world dominion.

The Spanish danger to the liberties of Western parochial states was never so great as the French danger—not even at the height of the power of Philip II—for the Spanish Power was an idol with feet of clay in a Western international arena in which the economic sinews of war were coming progressively, with each further round in the game, to count for more and more by comparison with mere military valour. The descendants of the Iberian Western Christian barbarians who had defeated the Maghribi Berber Muslim barbarians in a contest for the spoils of an Andalusian Umayyad Caliphate that had collapsed in A.D. 1010 were born soldiers in the Gothic and the Vandal vein; and, in their socially parasitic profession, they displayed an impressive adaptability when, in the Western General War of A.D. 1494-1525, they mastered a new-fangled Swiss infantry technique which, in this phase of a Western art of war, was the talisman of victory. This Spanish stock of military material was, however, as inadequate in quantity as it was outstanding in quality; for the Christians in sixteenth-century Spain were no more than an 'ascendancy' in a population which mustered perhaps no more than seven million souls in all, as against the fifteen or sixteen million culturally and communally homogeneous inhabitants of a contemporary France; and the Muslim and Jewish subject communities were Spain's economic mainstay. Whereas the Castilian and Aragonese soldiery of a sixteenth-century Spain were shepherds and herdsmen in civil life, her agriculture, such as it was, was carried on by a Morisco and a Catalan peasantry in the valley of the Wādī'l-Kabir and along the seaboard of the Mediterranean, while the Jews were the life of the trade and industry of the Spanish cities. Whereas France could feed her sixteen millions from home-grown cereals, Spain could not feed her seven millions without importing cereals from Sicily and from Northern Europe; and, as if these economic handicaps were not serious enough as they were, the Spanish 'ascendancy' did its worst to aggravate them by oppressing and evicting the Moorish and Jewish producers of Spanish wealth. Simultaneously, even the reservoir of Castilian Christian military man-power was depleted by the draining off of *conquistadores* to live happily ever after as renters taking toll of subject peasant populations in overrun Mexico and Andean worlds.

A brilliant portrait of sixteenth-century Spain has been painted by Eduard Fueter in his *Geschichte des Europäischen Staatensystems von 1492-1559* (Munich and Berlin 1919, Oldenbourg), pp. 79-103.

than her predecessor's. The slower tempo of the Modern Western World's expansion during its earlier stages had enabled France to cling to this role—albeit at the price of bringing ever direr disasters upon herself—from A.D. 1494 to A.D. 1870, with no more than a temporary eclipse *circa* A.D. 1562–98. But the Western Civilization's transit from a Modern to a post-Modern Age of Western history at the very moment at which Germany was supplanting France had been accompanied by a sudden immense acceleration in the tempo of Western geographical expansion; and a change of geographical scale which had wafted Germany into a commanding position by A.D. 1871 had by then already begun to gather an impetus that in A.D. 1945 was to bring Germany lower than France had ever yet fallen.

In a Western system of international relations which, in the meantime, had continued to expand until it had attained a literally world-wide range, a Germany who had bid for world dominion twice within one lifetime, in a brace of general wars fought in swift succession (*gerebantur* A.D. 1914–18 *et* A.D. 1939–45), had been compelled, in her turn, by A.D. 1945 to surrender the role of aggressive Central Power to a Soviet Union who occupied a commanding position in a geographical setting that was oecumenical now and no longer merely regional. In A.D. 1952, when an arena of competition which had originally been confined to Italy and Flanders had come to embrace the whole of the Old World outside the Soviet Union's own borders, the Soviet Union possessed sally-ports opening into the back-yards of Scandinavia, Western Europe, the Near and Middle East, the sub-continent of India, South-East Asia, Indonesia, China, Korea, and Japan. In the course of four centuries the geographical scale of a Western system of international relations had thus been enlarged to a stupendous degree; yet the lay-out of the arena and the stance of the gladiators face to face within it was recognizably the same in A.D. 1952 as it had been four hundred years earlier.

The War-and-Peace Cycle in post-Alexandrine Hellenic History

We have now perhaps reached the limit to which we can carry our analysis of the war-and-peace rhythm in the Modern and post-Modern chapters of Western history; and in any case we have carried it far enough to enable us, if we turn our attention to the post-Alexandrine chapters of Hellenic history, to see at a glance that a war-and-peace rhythm is discernible here too, and that some of the main features of it are identical with features that we have already observed in our Western example of the working of this particular law of Nature in the political affairs of civilizations.

In the Hellenic, as in the Western, case the series of cycles begins with an overture in which the parties to the competition are jockeying with one another not merely for victory in the race but for the winning of a place in the running; and this inaugural round of the cycle takes the form of a civil war among Alexander's successors over the swollen heritage of the Argeadae which is reminiscent of the civil war between a royal branch and a Burgundian ducal branch of the French House of

Valois over the swollen heritage of the Valois dukes of Burgundy. In the Hellenic case, again, a sequence of alternating bouts of war and spells of peace, that makes its first epiphany in the overture, then repeats itself in a cycle of competition between the survivors of the ordeal to which the overture had subjected all competitors who had had the hardihood to enter the lists. We shall also notice in the Hellenic course of events a tendency, which we have noticed in the corresponding Western story, for regional vortices which at first behave like so many independent focuses of military and political force to coalesce into a single vortex drawing into itself the whole of the action in all quarters of the international arena. In the evolution of a Western Balance of Power we have watched such outlying vortices round the marches between Western Christendom and the Ottoman Empire and between Western Christendom and Muscovy coalescing with the central vortex round Italy and Flanders. In the Hellenic story we shall see a vortex round the coasts of the Aegean in the Levant and a vortex round Sicily and Magna Graecia in the western basin of the Mediterranean¹ coalescing into a vortex engulfing the Mediterranean Basin from end to end.

We shall also see the partial neutralization of the Great Powers' potency, through their respective successes in frustrating one another's ambitions, giving opportunities for minor states to come to birth and grow in the interstices between the rugged cyclopean boulders which the deliberately engineered traffic-blocks in the avalanche have brought into a precarious equilibrium. For example, a Rhodian tripolis, that found itself in a key position in the new world called into existence by Alexander's overthrow of the Achaemenidae, was able, in the course of the overture cycle, during the General War of 321-301 B.C., to hold out in 305 B.C. against the siege artillery of Demetrius Poliorcêtês with the help of the coalition of Alexander's other successors that was opposing Demetrius's father Antigonus Monophthalmus's bid for world dominion. An Aetolian Confederacy of Continental Greek cantons and city-states, a similar Achaean Confederacy in the Peloponnese, and an Attalid Principality in the immediate hinterland of the Continental Asiatic half of the original homeland of Hellenism all started their political careers in the course of the overture during the catastrophic sequel to a supplementary war which had followed, in 282-281 B.C., the General War of 321-301 B.C.; and the exhaustion of the Great Powers in the next general war (*in Oriente gerebatur* 266-241 B.C.) not only gave these four already established minor states opportunities of consolidating and extending their previous gains, but also enabled partisans of reform at Sparta to regenerate their commonwealth by the social revolution of 227 B.C., and advocates of a quiet life at Athens to recapture a precarious independence for their country in 229 B.C.

While all these features in a post-Alexandrine Hellenic international landscape are reminiscent of the corresponding features in the landscape of a Western World in its Early Modern Age, the Hellenic tragedy differed from the Western in giving rein to violence with an unparalleled lack of restraint; and this demonic mania, which reminded a twentieth-

¹ 'The Ponent' of the Medieval Western mariners.

century Western historian of the temper that had erupted in his own world in his own later day, brought upon a post-Alexandrine Hellenic Society, in the first recurrence of the war-and-peace cycle after the overture, the catastrophe of a double general war to which a latter-day Western Society had not condemned itself till it had passed through three regular cycles of the rhythm and had entered on a fourth round. The recklessness of a post-Alexandrine Hellenic Society's violence in the conduct of its international affairs explains how it came about that the promise of the overture to the symphony was promptly and rudely belied by the performance in the first ensuing movement. The first war-and-peace cycle after the overture witnessed a decisive and irretrievable overturn of a post-Alexandrine Hellenic Balance of Power through the liquidation of all but one of a number of Great Powers which, in the course of the overture (*in Oriente currebat* 321-266 B.C.), had risen, not just from two to three, as in the course of the corresponding chapter of Early Modern Western history (*currebat* A.D. 1494-1568), but from two to as many as five.

At the moment of Alexander's death on the 13th June, 323, there were two Great Powers, and two only, in an Hellenic World whose eastern bounds Alexander had carried forward within the last eleven years from the Anatolian hinterland of the east coast of the Aegean Sea to the banks of an eastern tributary of the Indus. Alexander himself had momentarily united under his personal rule the domain over which the Achaemenian Empire had extended at its widest with the domain of a Macedonian Power which his father Philip had built up in Continental European Greece¹ between 357 and 338 B.C. The only other Great Power existing at that moment within the horizon of a thus vastly expanded Hellenic World was a Carthaginian Empire which had controlled the southern half of the western basin of the Mediterranean, with its African and Iberian continental hinterlands, since the closing years of the sixth century B.C.,² and which Alexander had not had time to liquidate as he had liquidated an Achaemenian Empire of which the Carthaginian had been a colonial counterpart in the political geography of a Syriac World. After the settling of the dust raised by the two successive wars for the possession of Alexander's heritage which had ended respectively at Ipsus in 301 B.C. and at Corupedium in 281 B.C., no less than five Great Powers came into view in the arena.

The Carthaginian Empire was still standing, not only intact but to all appearance more puissant than ever, in a still semi-detached West Mediterranean theatre of colonial competition between an Hellenic and a Syriac Society.³ Meanwhile, Alexander's ephemerally united heritage

¹ Sparta was the only Continental European Greek state that had been able to hold aloof from the League of Corinth that Philip had inaugurated in 338 B.C. as the constitutional instrument of a Macedonian hegemony.

² See IX. viii. 426-7, 428-9, 437-8, and 485-6.

³ In thus managing to retain her rank as a Great Power in an Hellenic or Hellenizing World in spite of the sudden vast increase in the scale of Hellenic life at the transition from a pre-Alexandrine to a post-Alexandrine Age of Hellenic history, Carthage achieved something that Venice failed to achieve at the transition from a Late Medieval to an Early Modern Age of Western history. *Circa* 281 B.C. Carthage was a Great Power still, whereas Venice, *circa* A.D. 1559, was lucky to find herself still independent and in possession of an empire in the Levant and on the Italian mainland that was now dwarfed

had been partitioned into three now more or less securely established successor-states which, under their appearance of being new creations artificially carved out by capricious strokes of Macedonian military adventurers' swords, revealed themselves on closer inspection to be, like the Carthaginian Empire, old structures masked, unlike the Carthaginian Empire, behind new façades. A Ptolemaic Power based on the Lower Nile Valley was an avatar of the Egypt of Psammetichus I; a Seleucid Power based on the alluvium of the Lower Tigris-Euphrates Valley (*Graecè* Babylonia, *Arabicè* 'Irāq) was an avatar of the Achaemenian Empire of Cyrus; an Antigonid Power based on the lower valleys of the Vardar (Axius) and the Struma (Strymon) was an avatar of the Macedonia of Philip II. The one genuinely new creation among the five Hellenic Great Powers that were in being at the end of the overture (*currebat* 321–266 B.C.) to the post-Alexandrine chapter of Hellenic history was a commonwealth which the city-state Rome had been building up in Central Italy between 340 and 290 B.C.¹

By 168 B.C. this one new Power was also the only survivor among the five Powers that had been in the arena in 266 B.C. Of the four Powers that had enjoyed the advantage of standing on old foundations, Carthage, the Seleucid Monarchy, and Macedonia had been felled to the ground by Roman blows in the years 201, 190, and 168, while Ptolemaic Egypt had been reduced to the status of a Roman protectorate when Roman diplomatic intervention had saved her in 170 B.C. from being annexed by Rome's defeated Seleucid adversary. This overturn of a post-Alexandrine Hellenic Balance of Power, and its replacement by an unchallengeable monopoly of power in the hands of Rome, was not incomparable, in its abruptness, to the overturn of a Balance of Power in Sinic history through Ts'in's destruction of her six peers between the years 230 and 221 B.C.; and an Hellenic violence reminiscent of the spirit of those Sinic 'contending states' accounts for the striking divergence between a course of Hellenic events in which an international Balance of Power was thus overturned before the completion of the first cycle after the overture and a course of Western events in which an international balance, inaugurated during a similar overture, had run

by the gigantic stature of Great Powers of a higher calibre that had loomed up all around her. This contrast between the respective fortunes of Carthage and Venice during these corresponding chapters of their histories is accounted for by two differences in their experiences. By A.D. 1559 Venice had long since met her Ottoman fate, whereas Carthage was not to meet her Roman fate till 264 B.C.; and by A.D. 1559 Venice had also felt the adverse economic effects of the Portuguese conquest of the Indies and the Spanish conquest of the Americas, whereas the Macedonian conquest of the Achaemenian Empire had no similar adverse economic effects on Carthage's monopoly of the African and Iberian hinterlands of her 'wooden curtain'.

¹ The Central Italian Roman Commonwealth that had been brought into being by 290 B.C. was as genuinely new as the Danubian Hapsburg Monarchy that came into being in A.D. 1526; for, though the Roman Central Italy which in 290 B.C. was an accomplished fact had been foreshadowed in an Etruscan imperialism in the seventh and sixth centuries B.C., these Etruscan attempts to bring the Greek settlements on the coast of Campania and the Latin settlements in the lower valley of the Tiber under the hegemony of the Etruscan settlements between the Tiber and the Arno had been as abortive as the divers ephemeral unions between Hungary, Bohemia, Poland, and the patrimony of the House of Hapsburg in South-East Germany which in their successive permutations and combinations had foreshadowed the establishment, in A.D. 1526, of a Danubian Hapsburg Monarchy that was to hold together for nearly four hundred years (see II. ii. 178–9).

through three subsequent regular cycles before it had begun to get out of hand.

The difference in temper between the Western gladiatorial combat of A.D. 1494-1559 and the Hellenic combat of 321-281 B.C. can be measured by the difference between the personal fates that overtook the principal adventurers in the two arenas. The military defeat suffered by Francis I at Pavia in A.D. 1525 was no less crushing than the overthrows of Antigonus at Ipsus in 301 B.C. and Lysimachus at Corupedium in 281 B.C., yet the worst that happened to Francis was to have to spend rather less than a year as a prisoner of war and to ransom himself at the price of undertaking to marry his adversary's sister and to renounce his claims to the Italian and Burgundian territories that were the stakes in his contest with Charles V. There was never any serious question of the destruction or even subjugation of a Kingdom of France which had brought upon itself this prostrating blow; and Francis had no sooner recovered his liberty and his throne than he broke the promises in exchange for which he had been released, and resumed a struggle that was fraught with no mortal danger either for his person or for his realm. Francis lived to die in his bed more than twenty-two years after the day on which he had been taken prisoner on the battlefield of Pavia. There is a piquant contrast between the impunity with which Francis thus played with fire and the experiences of an Antigonus and a Lysimachus, whose realms perished with them on the battlefield.

There were no such fatal casualties in the Western gladiatorial contest of A.D. 1494-1559; and the contrast between the characters of the Western and the Hellenic episode comes out still more sharply when we pass on to compare the respective fates of the victors. The worst that happened to Charles V was to become so weary of his Sisyphean task that he insisted on sloughing off his public burdens on to other shoulders and retiring into private life under conditions skilfully devised to give his body its long-overdue rest without prejudice to the long-neglected welfare of his soul. Like a discomfited Francis I, a disillusioned Charles V died in his bed; and this tame death did not overtake him till more than thirty-three years after a victory at Pavia whose aftermath had been still more ironically disappointing for the victor than it had been for his vanquished opponent. A more tragic destiny was in store for Charles V's Hellenic counterpart Seleucus Nicator, who, after overthrowing and slaying his last adversary, was foully murdered in his old age by a younger and more unscrupulous adventurer, to whom he had rashly given his confidence, before he had satisfied his heart's desire to set eyes once again on a Macedonian homeland which he had not seen for fifty-four years.

The mutual exhaustion of the belligerents in this last round (*debellatum* 282-281 B.C.) of the Wars of Alexander's Succession was so extreme that a Macedon from which an Alexander had gone forth, conquering and to conquer,¹ in 334 B.C. was overrun in 279 B.C. by barbarians from a North European hinterland who went on in 278 B.C. to cross the Dardanelles and break into the vast Asiatic dominions of Seleucus

¹ Rev. vi. 2.

Nicator's son and heir Antiochus I.¹ A poetic justice which, within a year of the murder of Nicator, thus brought the Macedonian Macbeth, Ptolemy the Thunderbolt, to his death in battle, in a vain attempt to defend the kingdom whose diadem he had usurped against the north-western barbarians' onslaught, had to be purchased by Macedon's tutelary genius at a veritably prohibitive price.

Du treibst mir's gar zu toll,
Ich fürcht', es breche!
Nicht jeden Wochenschluss
Macht Gott die Zeche.

This apprehensive exclamation, wrung from a Goethe who was observing, with his heart in his mouth, the criminal recklessness of his own contemporaries, might have been wrung, with no less reason, from a spectator of the international arena in either the Western World of the sixteenth century of the Christian Era or the Hellenic World of the Age of Alexander's successors; yet, in the less turbulent course of Western history, God's settlement of accounts with Man was relatively long delayed.

The fate that, in the Hellenic tragedy, a mad-dog militarist Pyrrhus had brought, by 272 B.C., before the close of the overture, on a small and backward kingdom on which he had irresponsibly attempted to force the untenable role of a Great Power was not brought on Sweden by Charles XII until after the corresponding Western tragedy had entered on the second of its regular recurrent cycles; and, though Epirus, after Pyrrhus had got himself killed at Argos in 272 B.C., was allowed to lapse into the tranquillity of a premature exhaustion, like Sweden after Charles XII's defiantly courted death in the trenches before Frederiksten in A.D. 1719,² this long since inoffensive little Continental Greek country was given over to pillage in cold blood by the Roman conqueror of

¹ In II. ii. 281, n. 1, it has been noticed that the Macedonians invited this barbarian invasion by their imprudence in first stimulating the European barbarians by an aggressive expansion at their expense in the reign of King Philip Amyntou (*regnabat* 359-336 B.C.) and then neglecting this reanimated barbarian frontier in order to turn their arms against the Achaemenidae and thereafter against one another. The equivalent event in Early Modern Western history would have been an invasion of Spain on the morrow of the Battle of St. Quentin (*commisum* 10 August, 1557) by a horde of resurgent Muwahhid Berbers from the Atlas or Murābit Berbers from the Senegal, with an impetus that we must imagine to have carried these erupting barbarians on beyond an overrun Spain into Italy in one direction and Mexico in the other. Castile did neglect her Berber frontier when, after the completion of the conquest of Granada in A.D. 1492, she failed to follow up her seizure of this last unsubjugated remnant of Andalusia by a seizure of North-West Africa that was the logical next step in the march of Castilian imperialism. Instead of concentrating all her military efforts on pushing forward to the natural frontier offered by the north shore of the Sahara, she made a few half-hearted descents upon North-West African ports while diverting the best part of her energies to a conquest of the Americas and to a competition with France for the hegemony over Italy. Spain, like Macedon, did pay a penalty for having thus looked back after having put her hand to the plough (Luke ix. 62); she exposed herself to the scourge of a piracy organized by Ottoman corsairs ensconced in North-West African naval bases on which Spain had neglected to secure her own hold. Yet this nuisance was trivial compared to the catastrophe that Macedon brought on herself in 279-276 B.C.

² Between A.D. 1494 and A.D. 1952 the only other actor of a leading part in the Western power game who had lost his life in battle had been one of Charles XII's predecessors on the throne of Sweden, Gustavus Adolphus. Napoleon, like Francis I, had died in his bed; Hitler had died in his bunker. By contrast, the deaths among eminent participants in a post-Alexandrine Hellenic power game are too numerous to record.

Macedon, Lucius Aemilius Paullus, in 167 B.C., 105 years after Pyrrhus's death, whereas in A.D. 1952, 233 years after the death of Charles XII, Sweden was still inviolate, though her fellow ephemeral Great Power Holland, as well as her two Scandinavian neighbours Denmark and Norway, had suffered at German hands in A.D. 1940 what Epirus had suffered at Roman hands in 167 B.C. In A.D. 1952 the ultimate military and political outcome of a Western Balance of Power that had been inaugurated in A.D. 1494 was still obscure; and, however ominously impenetrable might be the darkness that still shrouded the future, an already accomplished passage of 458 years testified that this Modern and post-Modern Western Balance of Power, whatever might be the denouement towards which it was heading, had at any rate already achieved a decidedly longer run than had been attained by an Hellenic Balance which Rome had overturned by establishing her sole supremacy in 168 B.C., not more than 153 years after the post-Alexandrine Balance had been inaugurated by the outbreak of the first fighting between Alexander's successors.

After these general considerations it will be convenient to set out the successive occurrences of the war-and-peace cycle in post-Alexandrine Hellenic history in a tabular form which we can then analyse in the light of our foregoing table of the corresponding Western phenomena.¹

The most striking feature in the history of the post-Alexandrine Hellenic war-and-peace cycles that our present table throws into relief is the balefully decisive importance of the Reduplicated General War of 220-189 B.C.

Before the outbreak of this war, an Hellenic World whose area had been vastly expanded by the conquests of Alexander the Great had not constituted a single unitary field of international politics but had consisted of two distinct arenas—one in the Levant and the other in the Western Basin of the Mediterranean—in which the competition between Great Powers had been carried on more or less independently; in the course of the Reduplicated General War of 220-189 B.C. these two arenas coalesced into one; the political event in which this coalescence was registered was the treaty of alliance against Rome that King Philip V of Macedon rashly concluded with Hannibal in 215 B.C. During the preceding period each of the two arenas had been infested with an aggressor Power of its own: the role played by Egypt in the Levant had been played by Rome in the Ponent.² After the close of the general war of the first cycle

¹ See Tables I, p. 255, and II, pp. 268-9.

² It is noteworthy that both Rome in the first Romano-Punic War (*gerebatur* 264-241 B.C.) and Egypt in the contemporaneous general war in the Levant (*gerebatur* 266-241 B.C.) employed sea-power as the principal instrument of aggression, whereas, in the history of a Modern Western balance of power, the successive arch-aggressors—France, Germany, and Russia—were, all alike, land-powers who were comparatively weak at sea. In the first Romano-Punic war, Rome transformed herself, by a technological *tour de force*, from the land-power that had conquered Italy and had defeated Pyrrhus's attempt to undo her work there into a sea-power capable of conquering Sicily and invading North-West Africa from an Italian base of operations. This difference in the matter of armament between the typical Hellenic and the typical Western aggressor Power was the corollary of a corresponding difference in geographical structure between the Hellenic and the Western World. The Hellenic World, throughout its history, was centred on a landlocked sea—the Aegean Basin at the beginning of the story and eventually the Mediterranean Basin as a whole. The geographical expansion of the

(in *Levante gerebatur* 266–241 B.C.), Egypt not only fell out of the running but actually became the principal victim of aggression instead of continuing to be the principal perpetrator of it, whereas Rome was provoked by an abortive Carthaginian war of revenge and Macedonian war of aggrandizement into assuming in the Levant, from 200 B.C. onwards, the aggressor's role which she had begun to play in the Western Mediterranean in 264 B.C.

The Reduplicated General War of 220–189 B.C. did not, however, merely unify the military and political action on the stage of Hellenic history round the now all-overshadowing presence of Rome;¹ it also imported into the conduct of Hellenic warfare a new vein of atrocity for which the arch-aggressor Rome was not solely responsible.

Though, in this episode of Hellenic history, the overture (*currebat* 321–266 B.C.) and the general war in the first cycle (*in Levante gerebatur* 266–241 B.C.) had produced heavy casualties among war-lords by comparison with the corresponding acts in the Modern Western drama, this first phase of the Hellenic episode came in retrospect to seem mild by contrast with the sequel. Judged according to this subsequent standard, the General War of 266–241 B.C. had been as 'temperate' a contest as the Modern Western wars of the second regular cycle (*currebat* A.D. 1672–1792) on which Gibbon looked back with an unprescient complacency² until he was overtaken by the outbreak of the General War of A.D. 1792–1815. The comparative temperateness of Hellenic warfare in this phase can be gauged by the fact that the deliberately and persistently aggressive policy of Egypt, directed though it was against both the Seleucid Monarchy and Macedon simultaneously, drove these two assaulted Powers into taking concerted action for their common defence on one occasion only, so far as we know, and then only for a spell of some five or six years (260–255 B.C.). This must mean that neither Power felt the aggression of Egypt to be a serious threat to its own survival. The comparative temperateness of the General War of 266–241 B.C. in

Hellenic Society left the maritime structure of the Hellenic World intact, albeit enlarged in scale, even after the incorporation of South-West Asia and Northern India. By contrast, the Western World had originally been centred on one corner of the Eurasian Continent; and here again the geographical expansion of the society did not produce any immediate radical modification of its original structure, since the world-wide oceanic extension of the Western World, which began towards the close of the fifteenth century of the Christian Era, was balanced by an eastward extension into the interior of the Eurasian Continent. Owing to this progressive enlargement of the continental area of the Western World, the arch-aggressor Power in the Western arena had continued to be a land-power from the inauguration of the Modern Western balance of power in A.D. 1494 down to A.D. 1952. All the same, the new Western World overseas that had been called into existence by Western maritime enterprise had gradually come to play a progressively greater part in redressing the balance of the old Western World on the Eurasian Continent. Whereas the bullion imported by the Spaniards from the Americas into Western Europe during the overture (*currebat* A.D. 1494–1568) and the first regular cycle (*currebat* A.D. 1568–1672) of this Modern and post-Modern episode of Western history had not availed to save Spain from falling out of the running, the 'colonial wares' that the overseas annexes of the Western World had afterwards come to produce had played an appreciable part in deciding the issue of the General War of A.D. 1792–1815; and in the subsequent general wars of A.D. 1914–18 and A.D. 1939–45 the decisive contribution to the defeat of Germany had been made by the war potential of the United States.

¹ On this portent see the passage of Polybius—*Oecumenical History*, Book I, chaps. 1–4—quoted in III. iii. 312–13.

² See the passage cited on p. 238, n. 2, above.

TABLE II. *Successive Occurrences of the War-and-Peace Cycle in post-Alexandrine Hellenic History*

Phase	Overture (321-266 B.C.)		First Cycle (266-133 B.C.)		Second Cycle (133-49 B.C.)	Third Cycle (49-31 B.C.)

¹ The first war between the Ptolemaic and the Seleucid Power for the possession of Coelê Syria and of the Mediterranean coasts of Anatolia from Cilicia to the Dardanelles.

² The first revolt of the plantation-slaves in Sicily (see V. v. 69-71).

³ Antigonos Monophthalmus's bid for world dominion, and his defeat.

⁴ The creation of a Roman Commonwealth embracing the whole of Central Italy. The half century that witnessed this Roman achievement saw the successive failure of a series of half-hearted attempts to re-establish in some form the Greek Great Power in

Sicily and Southern Italy that had been a going concern in the days of the Deinomenidae (*dominabantur circa* 485-466 B.C.) and the Dionysii (*dominabantur* 405-344 B.C.). These abortive enterprises were the Corinthian 'honest broker' Timoleon's intervention in Sicily (344-339 B.C.); the Spartan King Archidamus's intervention in Southern Italy (342-338 B.C.); the Epirot King Alexander's intervention in Southern Italy (333-331 B.C.); the Spartan Prince Cleonymus's intervention in Southern Italy (303 B.C.); the career of the Theraean adventurer Agathocles (*Syractis dominabantur* 322-289 B.C.). These episodes have been noticed in III. iii. 357, n. 1, and in IV. iv. 589-91.

¹² 220-217, the war in Continental European Greece between the Aetolian Confederacy and a coalition of Macedon and the Achaean Confederacy; 219-217, the fourth war between the Ptolemaic and the Seleucid Power; 218-201, the Hannibalic War; 215-205, the First Romano-Macedonian War; 202-198, the fifth war between the Ptolemaic and the Seleucid Power; 200-197, the Second Romano-Macedonian War; 191-189, the War between Rome and a coalition of the Aetolian Confederacy and the Seleucid Monarchy.

¹³ The overthrow of Lysimachus by Seleucus Nicator.

¹⁴ 280-272, the war in Southern Italy between Rome and a coalition of Tarentum and Epirus; 278-276, the war in Sicily between Carthage and Epirus.

¹⁵ 171-168, the Third Romano-Macedonian War; 149-148, the Fourth Romano-Macedonian War; 149-146, the Third Romano-Punic War; 146, the Romano-Achaean War.

¹⁶ The first bout of Roman civil wars.

¹⁷ This general peace was interrupted by the insurrections of Spartacus in 73-71 B.C. and of Catiline in 63-62 B.C.

¹⁸ The *Pax Romana*, under which the Hellenic World enjoyed political unity in a universal state constituted by the Roman Empire.

⁵ 266-261, 'the Chremonidean War' between Macedon (rehabilitated since 276 B.C. by Antigonus Gonatas) and a coalition of the Ptolemaic Power and its Continental Greek satellites; 260-255, the war between the Ptolemaic Power and a coalition of the other two Levantine Great Powers, Macedon and the Seleucid Monarchy; 253-246/5, naval warfare between the Ptolemaic Power and Macedon; 246-241, the third war between the Ptolemaic and the Seleucid Power.

⁶ The First Romano-Punic War.

⁷ 133-111, the Gracchan agrarian revolution in Roman Italy; 132-130, Aristonicus's proletarian insurrection in the *gleichgeschaltet* principality of Pergamum.

⁸ The second bout of Roman civil wars.

⁹ This breathing-space was interrupted by the second revolt of the plantation-slaves in Sicily (104-100 B.C.). The Hellenic World was in almost continuous revolution from 133 to 31 B.C., and even the spells of relative quiescence were broken by eruptions.

¹⁰ 224/3-222/1, the war in Continental European Greece between Sparta and a coalition of Macedon and the Achaean Confederacy; 221, the Seleucid King Antiochus III's first tentative attack on the barrier fortresses covering the Ptolemaic Empire's possessions in Coelê Syria.

¹¹ Hannibal's attack on, and conquest of, Saguntum.

the Levant is also attested by the recuperation of the Hellenic Society during the breathing-space (*durabat* 241–220 B.C.) that followed; for these two decades saw the culmination of the Hellenic Civilization's first rally¹ since its breakdown in the Atheno-Peloponnesian War of 431–404 B.C.

Against the background of this false dawn the unprecedentedly severe lapse into atrocity which the onset of the Reduplicated General War of 220–189 B.C. brought with it was thrown into sinister relief. In an earlier context² we have already noticed that, when the proud and virile Macedonians first crossed swords with the war-scarred Romans in 200 B.C., the Macedonian high command felt it necessary to safeguard the *moral* of their magnificent troops against the shocking spectacle of the carnage inflicted by new weapons which the Romans had learnt to employ in the Romano-Carthaginian War of 218–201 B.C.; yet, during these crucial years, a relatively sensitive Macedonian King Philip V was bringing himself into odium through the inhumanity of his own style of war by contrast with the practice of Alexander's successors and their epigoni. At an abortive conference between the belligerents in the Second Romano-Macedonian War that was held in the winter of 198–197 B.C. in Malis on the eve of the campaign that was to result in a military decision at Cynoscephalae, the following indictment of Philip is reported to have been addressed to him to his face by an Aetolian spokesman, Alexander Isius:

Alexander complained that Philip was not making peace sincerely now and was not in the habit of making war honourably when war was the order of the day. . . . He abandoned any attempt to face his opponents in the field, but signalled his flight by burning and plundering the towns—a policy of avenging defeat by ruining the prizes of the victors. What an utter contrast to the standards observed by past wearers of a Macedonian crown! These sovereigns had fought one another continuously in the open country but had rarely destroyed and wrecked the towns. This was a fact of general knowledge, established by the war which Alexander the Great waged against Darius for the empire of Asia and again by the struggle of Alexander's successors over his inheritance, when they fought Antigonos for the possession of Asia in coalition. Moreover, the policy of the successors in the second generation, down to Pyrrhus, had been the same. They were ready enough to stake their fortunes in battle in the open country and they left nothing undone in their efforts to overcome one another by force of arms, but they used to spare the towns in order that the victors might enjoy the dominion over them and might receive due honours at the hands of their subjects. On the other hand, to destroy the objects of contention in the war while leaving the war itself still in train was the act of a madman and of one far gone in the malady; yet that was precisely what Philip was now doing.³

By the turn of the third and second centuries B.C. there had indeed been an appalling deterioration, in the Levant as well as in the Western Mediterranean, in those standards of conduct in international relations that had prevailed in the Hellenic World during the preceding three or

¹ The symptoms of this rally have been surveyed in V. vi. 287–9.

² In II. ii. 163.

³ Polybius: *Oecumenical History*, Book XVIII, chap. 3.

four generations. In the Reduplicated General War of 220-189 B.C. there was no refflorescence of the chivalry that had been shown on both sides during Demetrius Poliorcêtês' siege of Rhodes in 305-304 B.C. and that had afterwards been shown to Demetrius, after his final surrender in 285 B.C., by Seleucus Nicator; and, if in this post-Hannibalic chapter of Hellenic history there was nothing to compare with these earlier mitigations of the barbarity of War, *a fortiori* there was no counterpart of the social solidarity which, in the halcyon days of a delusively promising antecedent spell of peace, the Hellenic World had displayed when, in 227 B.C., kings, princes, and city-states had vied with one another in contributing to the relief of Rhodes after this ornament of a post-Alexandrine Hellenic World had been laid in ruins by an earthquake.¹

A comparison of our two tables brings out the further fact that, in recurrences of cycles of War and Peace, inter-state wars and civil wars are equivalent to one another and are interchangeable. We have noticed already² that, in the Modern Western episode, a series of wars that came to be fought as inter-state wars between France, Spain, and other parochial states was inaugurated by a civil war between two branches of the French House of Valois. Conversely, in the post-Alexandrine Hellenic episode, a series of wars that was similarly inaugurated by a civil war between rival successors of the Macedonian Argead king Alexander the Great, and that then similarly passed over into inter-state wars between Egypt, Asia, Macedon, Rome, and Carthage, was not brought to an end by Rome's overthrow of the last surviving rival Power in 168 B.C., but ran on thereafter through a second cycle into a third cycle in the form of a succession of civil wars within the bosom of a now oecumenical Roman Commonwealth.

The War-and-Peace Cycle in post-Confucian Sinic History

If we now enlarge our field of historical vision by bringing into our synoptic view the episode of Sinic history traditionally known as the 'Period of the Contending States' (*Chan Kuo*), we shall detect correspondences between this post-Confucian chapter of Sinic history and both the post-Alexandrine chapter of Hellenic history and the Modern and post-Modern chapters of Western history—and this not only in the general features of the historical landscape but also in the particular structure of the successive war-and-peace cycles.

Like those other two series, this Sinic series of cycles was originally set in motion by a struggle for possession of the derelict heritage of a former Great Power in which there had been a breakdown of the central government. The heritages of Alexander the Great and of Charles the Bold, which had been the original apples of discord in the post-Alexandrine Hellenic and in the Modern Western episode, had their counterpart in the post-Confucian Sinic episode in the heritage of the state of Tsin,³ which fell to pieces in the fifth century B.C. after having played a leading part in a previous chapter of Sinic history as one of two prin-

¹ See Polybius: *Oecumenical History*, Book V, chaps. 88-90.

² In the present volume on pp. 237-8, above.

³ See V. vi. 293-4.

cial competitors for the prize of hegemony in the Sinic World.¹ In the post-Confucian Sinic episode, again, the series of cycles had an overture in which the historically significant warfare took the form of civil war; and in the course of the first subsequent regular cycle the severity of the incidence of War upon Society was accentuated, in the Sinic World likewise, by appalling increases in the effectiveness of weapons,² in the ruthlessness with which non-combatants, as well as defeated combatants, were treated,³ and in the magnitude of the political prizes of victory and penalties of defeat.⁴ After it had exacerbated the evils of War to this intolerable degree, the Sinic episode was terminated, like the Hellenic, by the establishment of an oecumenical peace through the elimination of all the contending Powers except one single surviving victor.

A chronological analysis of this post-Confucian episode of Sinic history reveals a series consisting of an overture and two subsequent cycles with respective wave-lengths of 78, 86, and 112 years.⁵ In the overture the *Leitmotiv* was the break-up of the state of Tsin into three successor-states; in the first of the two ensuing cycles it was the abortive attempt of one of Tsin's three successor-states, Wei, to play the part of arch-aggressor Power; in the next cycle it was the assumption of the arch-aggressor's part by the state of Ts'in with such success that this cycle ended in the political unification of the Sinic World through the overthrow, by Ts'in, of all other Powers in the Sinic international arena.

In the overture (*currebat* 497⁶-419 B.C.) the most significant bouts of warfare took the form of civil wars.

¹ See IV. iv. 66 and V. vi. 292-3. Tsin's principal rival during this earlier chapter of Sinic history had been Ch'u.

² The adoption of the Eurasian Nomad military weapons, equipment, and tactics at the turn of the fourth and third centuries B.C. by Chao, a successor-state of Tsin which had inherited Tsin's wardenship of an anti-Nomad march, has been noticed in III. iii. 167, n. 1. This Sinic technical military innovation was the counterpart, in post-Confucian Sinic history, of the adoption of new weapons by the Romans during the Hannibalic War and of the application to War of the new driving forces of Democracy and Industrialism in the Modern Western World in the seventh decade of the nineteenth century of the Christian Era (see IV. iv. 151-2). It is significant that the Sinic state that was the first to make this revolution in its military technique during the Sinic General War of 333-247 B.C. should also have been the state that, at a later stage of the same war, successfully repulsed the attacks of the state of Ts'in, which, by that time, had established its military ascendancy over all other Powers in the Sinic World. Chao's successful resistance to Ts'in's repeated attempts to conquer her during the years 270-258 B.C. caused this general war to end in an inconclusive peace and postponed the political unification of the Sinic World by force of Ts'in's arms for half a century (from 270 B.C. to 221 B.C.).

³ See Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), p. 194.

⁴ See Maspéro, H.: *La Chine Antique* (Paris 1927, Boccard), pp. 390-1, quoted in V. vi. 295, for the observation that, during the post-Confucian paroxysm of a Sinic Time of Troubles, the contending states were fighting for existence, as distinct from the smaller stakes of independence or hegemony for which they had fought during the pre-Confucian paroxysm. Franke points out, however, in op. cit., vol. i, p. 178, that the conventional restriction of the term 'the Period of Contending States' to the post-Confucian paroxysm is an arbitrary misnomer, for the period of no less than 36 princes and the destruction of no less than 52 states between the years 722 and 481 B.C. is recorded by Confucius in his annals of that period of Sinic history. The post-Confucian series of war-and-peace cycles was the second of two paroxysms which, together, constitute the Sinic Time of Troubles. In previous contexts (in IV. iv. 65-66 and in V. vi. 292-5) we have dated the beginning of the Sinic Time of Troubles from the outbreak of the first great war between Tsin and Ch'u (*gerebatur* 634-628 B.C.).

⁵ See Table III, opposite.

⁶ This year, which saw the outbreak of the great civil war (*gerebatur* 497-490 B.C.) in

TABLE III. *Successive Occurrences of the War-and-Peace Cycle in post-Confucian Sinic History*

¹ These dates are reckoned in terms of the domestic history of the state of Tsin. If we were reckoning in terms of the contemporary history of the state of Ch'u, we should have to date the beginning of the overture in 506 B.C. instead of dating it in 497 B.C., and the Time-span of the overture would then run to 87 years, as compared

with the 86 years of the first regular cycle and the 112 years of the second regular cycle.

² The *Pax Sinica* running from the establishment of a Sinic universal state by T'sin She Hwang-ti to its dissolution in the last days of the Posterior Han.

During this overture a common tendency towards spontaneous disruption through the play of centrifugal domestic forces was at work in all the larger states of the Sinic World of the day. The anarchic effect of the institution of feudalism, which had previously made itself felt at the expense of a once oecumenical Chóu Power, and which had brought about the breakdown of the Sinic Civilization and the onset of a Sinic Time of Troubles before the close of the seventh century B.C., after the Chóu had become manifestly impotent to control their parochial vassals, was now making itself felt within the body politic of each of these parochial states that had been the beneficiaries of this centrifugal tendency in the preceding chapter of the story. The principal sufferers in the fifth century B.C. were the states that had exhausted themselves in the seventh and sixth centuries by taking leading parts in the competition for hegemony during that earlier paroxysm. Now, however, that it was the turn of the parochial states to undergo an ordeal which had already worsted the imperial Chóu, the local responses to this identical challenge were far from being uniform. The two parochial states which had played the most ambitious—and consequently the most exhausting—parts in the first paroxysm of the Sinic Time of Troubles (*saevebat* 634–528 B.C.) were Tsin and Ch'u; and, after the failure first of Ch'u's final attempt to impose her hegemony by force of arms in the war of 538–528 B.C.¹ and then of Tsin's subsequent motion to deal a *coup de grâce* to Ch'u in 506 B.C.,² the authority of the central government was at a low ebb in both states. The sequels, however, were dramatically different in the two cases.

Ch'u's predicament was, to all appearances, by far the more serious of the two, for, whereas Tsin at this time was threatened only by domestic disruptive forces, Ch'u was the target of foreign attacks as well. In the very year, 506 B.C., in which Tsin found herself too feeble to strike, Ch'u was attacked and overrun by Wu—a *ci-devant* barbarian state in the Lower Yangtse Basin which had followed Ch'u's example in adopting the Sinic culture and turning to account the consequent potential enhancement of her military strength by intervening in the arena of Sinic power-politics. In this crisis in Ch'u's fortunes, Ch'u was saved by the recklessness of her parvenue adversary Wu and by the rise, in this adversary's rear, of another ambitious *ci-devant* barbarian state, the principality of Yüe in the country that was eventually to become the Chinese province of Chekiang. In 506 B.C. Yüe saved Ch'u from annihilation by attacking Wu from behind; and, though Wu subsequently took her revenge on Yüe by imposing her suzerainty upon her in 494 B.C.,³ Wu was ruined by these successive triumphs over Ch'u and Yüe. They

the state of Tsin, marks the true beginning of the first war-and-peace cycle of the *Chan Kuo* period of Sinic history. Since this great civil war was the beginning of the break-up of Tsin, and since the break-up of Tsin was the historic event which set this new series of war-and-peace cycles in motion, 497 B.C. is manifestly a more significant date to take as marking the beginning of the *Chan Kuo* period than either 403 B.C., which saw the recognition *de jure* of a break-up of Tsin into three successor-states which by 403 B.C. had been an accomplished fact for half a century past, or 479 B.C., which is the traditional date for the death of Confucius (see V. vi. 294, with n. 3).

¹ See Maspéro, *op. cit.*, pp. 348–51, and the present Study, V. vi. 293.

² See Maspéro, *op. cit.*, pp. 352–3.

³ See *ibid.*, p. 355.

tempted her to make a bid for hegemony; and, while she was engaged on an unsuccessful assault on Ts'i during the years 489-485 B.C.,¹ King Hui of Ch'u seized the opportunity to re-establish his kingdom on firm foundations between the years 488 and 481.² Thereafter, in 473, Ch'u was suddenly liberated from the menace of Wu through the destruction of Wu at a resurgent Yüe's hands. The combined effect of Ch'u's internal reconstruction during the years 488-481 B.C. and her liberation from external pressure in 473 B.C. was to enable Ch'u, not merely to survive, but to expand. Her success in meeting the challenge of internal disintegration which was being presented to all the major parochial states of the Sinic World in the fifth century B.C. was registered in her successive conquests of adjoining minor states in the central arena of the Sinic World. Ch'u annexed Ch'ên in 479 B.C., Ts'ai in 447 B.C., and K'i in 445 B.C.³

The effective reassertion of the central government's authority in the state of Ch'u in 388-381 B.C. had its counterpart in the state of Ts'i, which likewise survived an attack delivered by Wu and likewise overcame its disruptive domestic feudal forces—though in Ts'i's case at the price of an eventual change of dynasty in 379 B.C.⁴ These triumphs over feudalism in Ts'i and Ch'u stand out in sharp contrast to the collapse of the central government's authority in the state of Tsin in 497-490 B.C. During those years Tsin was disrupted and devastated by a civil war between rival factions of feudal lords which the Crown was impotent to prevent. The outcome was the virtual partition of Tsin between the four feudal houses on the winning side; this partition was confirmed by the outcome of a supplementary civil war (*gerebatur* 455-453 B.C.)⁵ in which one of the four nascent successor-states of Tsin was annihilated by a coalition between the other three. This partition of Tsin in 453 B.C. between the successor-states Chao, Wei, and Han *de facto* received recognition *de jure* in 403 B.C., and the royal house of Tsin was formally disestablished in 376 B.C., 130 years after its loss of effective power. This break-up of Tsin in the fifth century B.C. was an event of greater historical importance than the contemporary survival of Ch'u because it changed the politico-military configuration of the Sinic World and opened the way for the eventual triumph of Ts'in, Tsin's previously isolated and backward western neighbour.

This denouement of a post-Confucian Sinic drama, for which the ground had thus been prepared during the overture, was, however, delayed by an abortive but determined attempt on the part of Wei, one of the three successor-states of Tsin, to play, in the post-Confucian paroxysm of a Sinic Time of Troubles, the part that had been played in a pre-Confucian paroxysm by Tsin herself. Wei's bid for supremacy in the Sinic World was the *Leitmotiv* of the first regular war-and-peace cycle (*currebat* 419-333 B.C.) in the post-Confucian series.

In thus aspiring to a role to which Tsin had proved unequal, Wei was courting the disaster that eventually overtook her. The largest and strongest of the three successor-states of Tsin was not Wei, but Chao;

⁴ See *ibid.*, pp. 181-2.

⁵ See *ibid.*, p. 180; Maspéro, op. cit., p. 366.

and Chao had opportunities that were not open to either Wei or Han for extending her territory and improving her military technique, thanks to her geographical situation on the border between the Sinic World and the Great Eurasian Steppe.¹ By contrast, Wei had for her western neighbour not the Eurasian Nomad World but the potentially more formidable Sinic anti-Nomad march-state of Ts'in; and Wei's territory was not only smaller in the aggregate than Chao's; it was also divided into three geographically discontinuous fragments, one of which lay on the farther side of Chao's territory, and another on the farther side of Han's, while Han's metropolitan territory, which lay south of the Yellow River, was similarly insulated by both the territory of Wei and the remnant of the imperial patrimony of Ch'ou from a detached province, north of the river, which was wedged in between the territories of Wei and Chao.² This awkward geographical distribution of the former domain of Tsin condemned Wei to find herself perpetually at war with her two fellow successor-states in addition to the wars with other neighbours which she brought upon herself by her aggressive policy of expansion.

The general war (*gerebatur* 419-370 B.C.) with which this cycle opened consisted of a series of efforts on Wei's part to dominate her neighbours.³ Wei's first move was to take advantage of the domestic troubles, common to all states in the Sinic World of the day, by which Wei's western neighbour Ts'in was paralysed during the years 415-384 B.C.⁴ In the course of the years 419-409 B.C.⁵ Wei reconquered from Ts'in a strategically important belt of territory inside the great loop of the Upper Yellow River which had been part of the original domain of Wei's parent state Tsin but had been conquered from Tsin by Ts'in during the pre-Confucian paroxysm of the Sinic Time of Troubles. This reconquest by Wei of 'the Country west of the River' (Ho-si) in 419-409 B.C. was followed up by a temporarily effective subjugation of Han; but in 386 B.C. Chao succeeded, with Ts'i's help, in resisting Wei's efforts to complete the reunification of Tsin's former domain by subjugating Chao likewise; and, though Wei inflicted defeats on Ts'i in 384, 380, and 378 B.C., and on Ch'u in 371 B.C., her bid for oecumenical supremacy was frustrated in 370 B.C. by the combined forces of Chao and Han after Han had doubled her area and resources in 375 B.C. by annexing her neighbour on the west, the state of Cheng.⁶

This negative outcome of the General War of 419-370 B.C. was confirmed by the outcome of the supplementary wars of 354-340 B.C.⁷ This bout of warfare opened, significantly, with a campaign in which Wei lost to Ts'in part of the reconquered territory 'west of the River'. This reverse was the signal for a general attack on Wei; and, though Wei staved off her now inevitable fate by winning repeated victories against

⁷ See Maspéro, *op. cit.*, pp. 394-6.

heavy odds, she was eventually brought to the ground in 340 B.C. The most important result of this bout of supplementary wars in terms of the redistribution of territory was the permanent recapture from Wei by Ts'in of a portion of the long-disputed territory 'west of the River' which gave the hitherto mountain-locked 'Country within the Passes'¹ a sally-port into the great plain of the Lower Yellow River Basin; and this decisive shift of the frontier between Ts'in and Wei in Ts'in's favour was registered in changes of the sites of the capitals of the two states. In 350 B.C. the capital of Ts'in was moved eastward from its former location in the Middle Wei Valley to a point in the Lower Wei Valley, opposite the site of the future Si Ngan;² in 340 B.C. the capital of Wei was moved eastward from its now perilously exposed former location at Ngan-yi, which had been overrun by the Ts'in forces in 352 B.C., to the site of the future Kai-fêng.³

The second and last of the post-Confucian Sinic regular war-and-peace cycles (*currebat* 333-221 B.C.) saw the series brought to an end through the political unification of the whole Sinic World by force of Ts'in's arms. The opportunity for performing this feat was presented to Ts'in by Wei's failure to establish her supremacy during the preceding cycle. But Ts'in would not have been in a position to succeed in an enterprise in which Wei had thus failed if she had not previously fitted herself for the task by innovations in her military technique, administrative organization, and economic policy (above all, measures for increasing her agricultural productivity and, therewith, her man-power) which were more rational, more radical, and more ruthless than any contemporary reforms in any other existing Sinic state. This internal transformation of the state of Ts'in was carried out during the reigns of the princes Hien (*dominabatur* 384-361 B.C.) and his son Hiao (*dominabatur* 361-338 B.C.).⁴ The moving spirit was Wei Yang (*alias* Kung-sun Yang, *alias* Shang Yang),⁵ a cadet of the princely house of the ancient minor central state of Wei.⁶ He had first taken service under the government of the state of the same name—one of the three successor-states of Tsin—which at this time had not only imposed its suzerainty upon Shang Yang's native state of Wei but was attempting to establish its supremacy over all other states in the Sinic World. After having rejected a previous overture from Ts'in, Shang Yang transferred his allegiance from Wei, the successor-state of Tsin, to Ts'in during the reign of Hiao; and, though the revolutionary character of his measures provoked opposition to which he succumbed after Hiao's death, he succeeded in permanently changing the face of Ts'in by carrying out enactments which could not have been repealed without bringing to a halt the aggressive military expansion that these drastic measures enabled Ts'in to achieve with

⁶ Not to be confused with the parvenue Wei that was one of the three fifth-century successor-states of Tsin. Though the two names are oral homonyms, they are conveyed visually in two different ways.

ever increasing success. Though the most conspicuous motif of the first post-Confucian Sinic regular war-and-peace cycle (*currebat* 419-333 B.C.) was the abortive attempt of Wei to win an oecumenical supremacy, the course of the succeeding cycle (*currebat* 333-321 B.C.) was to make it evident, in retrospect, that the most significant event in Sinic history during the first regular cycle had really been the internal reconstruction of Ts'in.

The great war (*gerebatur* 333-247 B.C.) that inaugurated the second of the post-Confucian Sinic regular war-and-peace cycles opened, like the great war in the first of the post-Alexandrine Hellenic cycles, with two contemporaneous but unrelated sets of hostilities in two different theatres, one in the Yellow River Basin and the other in the Yangtse Basin; and the action in 333 B.C. in the Yangtse Basin, which took one of those sensational turns that were characteristic of war and politics in these southern fringes of the Sinic World, must have seemed at the time to be by far the most significant public event of the year. In 333 B.C. Yüe attacked Ch'u and brought upon herself a crushing defeat which was the end of Yüe as a Great Power. The former territory of Wu, which Yüe had held since 473 B.C., was now annexed by Ch'u, while Yüe's home territory broke up into petty principalities which fell under Ch'u's suzerainty.¹ The sequel was to show, however, that this imposing apparent increase in the strength of Ch'u was of no avail against the scientifically developed strength which Ts'in was now putting forth in the Yellow River Basin.

The enhancement of Ts'in's strength through the reforms of Shang Yang had become sufficiently apparent already during the wars of 354-340 B.C. to evoke in 333 B.C. a collective security pact between the other six Great Powers in the Sinic World of the day—the three successor-states of Tsin, together with Ch'u, Ts'i, and Yen—in which the contracting parties undertook to come with one accord to the aid of any of their number who might be attacked by Ts'in.² The six thus admittedly threatened Powers continued, however, to fall out with one another, while Ts'in showed unflinching skill in fomenting their mutual antagonism and allaying their suspicions of Ts'in's own aggressive designs—even after these had been unmasked, time and again, in action which told its own tale for those who had eyes to see; and consequently, from the beginning of this second and last cycle of the series in 333 B.C. down to its close in 221 B.C., there was only one occasion on which Ts'in had to face the united forces of all six Powers in the field. Ts'in's policy, like Hitler's, was to take her intended victims 'one by one'; and, unlike Nazi Germany in a post-Modern Western World, Ts'in succeeded in carrying this transparently Machiavellian policy through to its long premeditated goal when in 221 B.C. she completed the forcible unification of the entire Sinic World under her own oecumenical rule.

¹ See Maspéro, *op. cit.*, p. 400, with n. 1; Franke, *op. cit.*, vol. i, pp. 188-9.

² The moving spirit was Su Ts'in, a professional statesman who retaliated by this diplomatic coup for the lack of appreciation of his abilities that had been shown by the government of his native state Ts'in. After having failed to find professional employment in Ts'in, Su Ts'in had been taken into the service of Yen and Chao (see Hirth, F.: *The Ancient History of China* (New York 1908, Columbia University Press), pp. 308-11).

Ts'in's first move in the Sinic General War of 333-247 B.C. was a campaign against Wei (*gerebatur* 332-328 B.C.) in which Ts'in, profiting by the vantage ground which she had won from Wei in the first campaign of the wars of 354-340 B.C., now conquered from Wei the rest of 'the Country west of the River' and other border districts into the bargain.¹ A counter-attack against Ts'in in 318 B.C. by the combined forces of all the other six Powers, reinforced by Eurasian Nomad mercenaries, resulted in the sanguinary defeat of the allies and the reduction of Wei and Han to the rank of impotent satellites of the victor Power;² and, after Ts'in had thus confirmed her hold on the passes opening eastward from the Wei Valley into the Lower Yellow River Basin,³ she proceeded in 316 B.C. to anticipate Ch'u by seizing the command over the passes opening southward from the Wei Valley into the Upper Yangtse Basin and imposing her own suzerainty on the two contending local semi-barbarian states between which the vast and potentially productive territory that was eventually to become the Chinese province of Szechwan was at that time divided.⁴ By 285 B.C. Ts'in's resources had been doubled by the thoroughgoing incorporation of this country into her body politic;⁵ but Ts'in had not waited for this consummation in order to use the occupied territory as a jumping-off ground against Ch'u. In a series of offensives delivered in 312-311 B.C.,⁶ in 302-292 B.C.,⁷ and in 280-272 B.C.,⁸ Ts'in annexed from Ch'u first the Han Valley and then the Middle Yangtse Basin, which was the homeland of the Ch'u Power. The capital city, Ying, fell in 278 B.C.⁹ The first move in the last of these three campaigns was an encircling movement in which Ts'in 'mopped up' the barbarian no-man's-land beyond Ch'u's southwestern fringes.¹⁰

While Ts'in was thus wearing down Ch'u with her right hand, she still had strength to spare in her left hand to crush a coalition between Ts'i, Han, and Wei (*debellatum* 298-293 B.C.).¹¹ Ts'in made sweeping annexations in the heart of Wei between 286 B.C. and 275 B.C.¹²

Even now that Ts'in's ominous shadow had thus been cast right across the Sinic World, her prospective victims did not abstain from fighting one another to Ts'in's advantage. In 286 B.C. Wei, Ts'i, and Ch'u combined to partition Sung in revenge for conquests which Sung had made at the expense of all three allies in 318 B.C.¹³ Thereafter, in 285-279 B.C., Ts'i was attacked and temporarily occupied by Yen with the support of Chao, Wei, Ch'u, and, of course, Ts'in,¹⁴ who was the ultimate beneficiary from this fratricidal warfare through which the other surviving states were using up the last remnants of their strength.

Towards the close of the third decade of the third century B.C. it

looked as if an offensive which had been maintained by that time for some sixty years had now brought the arch-aggressor Power to within a stone's-throw of her goal of world conquest; but at this point Ts'in's career of aggression was checked, and thereafter the general war was brought to a conclusion just short of the decisive result that had now long since come to be eventually inevitable.

The principal cause of Ts'in's temporary frustration was the toughness of the state of Chao, which, like Ts'in herself, was a march-state of the Sinic World over against the Eurasian Nomad barbarians, and which had, as we have seen, been the first Sinic state to enhance her military efficiency by adopting the Nomads' armament and tactics. Though Ts'in had inflicted one defeat on Chao in 280 B.C.,¹ she suffered severe reverses when she returned to the attack in 270 B.C.² and again in 262-258 B.C.³ The second cause of Ts'in's temporary discomfiture was the encouragement that Chao's spirited and effective self-defence gave to other threatened Powers. When, in 263 B.C., Ts'in had invaded the detached northern enclave of Han territory (the Shang-tang) in an interstice between the territories of Wei and Chao, and the central government of Han had proved impotent to defend this outlying province, the Shang-tang had offered its allegiance to Chao, and Chao had accepted this dangerous gift. This was Ts'in's *casus belli* against Chao in 262 B.C., and the first consequence was disastrous for both the protégés of Chao and their protectors. In 260 B.C. a strong force which Chao had thrown into the capital of the Shang-tang was compelled by a besieging Ts'in army to capitulate and was then massacred. In 258 B.C., however, when a Ts'in army laid siege to Han-tan, the capital of Chao itself, it failed to take this city and eventually suffered a disaster under its walls through the intervention of Wei on Chao's side.

Though Wei paid dearly thereafter for this audacity, Chao was saved, and the concerted diplomacy of four statesmen representing the states of Chao, Wei, Ts'i, and Ch'u⁴ succeeded in dragging the war out to an inconclusive close in 247 B.C.⁵ Their diplomacy was assisted—and this was the third cause of Ts'in's temporary discomfiture—by the falls of a statesman and a general who had been the joint authors of Ts'in's previous successes. The year 265 B.C. had seen the disgrace of the minister Wei Jan, who had been in charge of the government of Ts'in for the past thirty-one years.⁶ The year 258 B.C. saw the suicide, by royal command, of Po K'i,⁷ whom Wei Jan, upon his own accession to office, had appointed generalissimo of the Ts'in armies, and who had been the winner of Ts'in's subsequent military victories from the overthrow of the coalition in 293 B.C.⁸ to the capture of the Shang-tang from Chao in 260 B.C. The offence that cost Po K'i his life was his refusal to

⁸ See Hirth, op. cit., p. 318.

continue to serve under the unworthy successor of his former patron and partner Wei Jan.

This combination of circumstances postponed the date of the inevitable denouement; but, when, after a breathing-space of seventeen years (*currebat* 247–230 B.C.), Ts'in returned to the attack under the command of an implacable King Chêng (*accessit* 246 B.C.) who was to make himself the first emperor of a Sinic universal state under the title of Ts'in She Hwang-ti,¹ the bout of supplementary wars (*gerebantur* 230–221 B.C.)² was as dramatically short as the foregoing general war (*gerebatur* 333–247 B.C.) had been inordinately long.

Within these ten years 230–221 B.C. Ts'in destroyed and annexed all the six surviving other states, together with the surviving fragments of Yüe which had been under the suzerainty of Ch'u since 333 B.C.³ Han, who was the first victim, submitted tamely to her extinction in 230 B.C., and of all the six, the only one to put up a strenuous resistance was Chao. The reduction of Chao cost Ts'in two years of hard fighting (*debellatum* 229–228 B.C.); and, even after the fall of the capital, Han-tan, in 228 B.C., an indomitable remnant of Chao's army withdrew northward into the highlands adjoining the border of the Eurasian Steppe, and set up there a refugee state Tai, as a remnant of Assyria's army had withdrawn to Harrân after the fall of Nineveh in 612 B.C. The year 226 B.C. saw the fall of Yen, save for its outlying north-eastern annex in Liao-tung, and the year 225 B.C. the fall of Wei. The subjugation of Ch'u, like that of Chao, required two campaigns (*gerebantur* 223–222 B.C.), in the second of which the Ts'in armies 'mopped up' the Yüe principalities as well as their suzerain. The same year 222 B.C. saw the destruction of the refugee remnants of Yen in Liao-tung and of Chao in Tai. In 221 B.C. the forcible political unification of the Sinic World at the hands of Ts'in was completed by the *Gleichschaltung* of Ts'i, which, after having passively watched its fellow victims being extinguished one by one, now submitted in its turn as tamely as Han had submitted in 230 B.C.⁴

A Synoptic View of the Currency of the War-and-Peace Cycle in the Histories of the Western, Hellenic, and Sinic Civilizations

If we plot out the series of war-and-peace cycles in Sinic history during the years 497–221 B.C. in the tabular form in which we have already presented the cycles in Hellenic history during the years 321 B.C.–31 B.C. and the cycles in Western history during the years A.D. 1494–1945, we shall observe a common pattern that is unmistakable; and this uniformity in the structure of three episodes in the mutually independent histories of three civilizations, of which the Western episode did not overlap

¹ The moving spirit in this last phase in the process of unification in the Sinic World was Ts'in She Hwang-ti's minister Li Sse (see Bodde, D.: *China's First Unifier* (Leiden 1938, Brill)).

² See Maspéro, op. cit., p. 424; Franke, op. cit., vol. i, pp. 198–9.

³ See VI. vii. 167.

⁴ After 221 B.C. the only Sinic parochial state that still retained a nominal independence as an enclave within the universal state established by Ts'in was the ancient central state Wei—the native state of the fourth-century statesman Shang Yang, whose revolutionary innovations in the state of Ts'in had been the secret of Ts'in's subsequent military and political achievements.

chronologically with either of the other two, while the Sinic and the Hellenic episode were out of step with one another to the extent of about 190 years,¹ suggests that the operation of a Balance of Power between rival parochial states is governed by its own particular 'laws of Nature' which reveal themselves regularly in different social milieux because they are inherent in a particular human predicament which has been these divers' societies common experience.

It would be open to us to extend our field of induction for ascertaining the purport of these particular 'laws' by taking further samples in addition to the three that we have now examined. Each of these three episodes is, indeed, a second chapter in a story whose first chapter we have left unanalysed. The continuity of the post-Confucian Sinic episode with a pre-Confucian chapter of the same story is manifest, since most of the dramatis personae in the two acts are identical, notwithstanding the change in both the cast itself and in the grouping of the actors on a gradually expanding stage that resulted from the break-up of the state of Tsin in the fifth century B.C. In the corresponding passages of Hellenic and Western history the continuity of the action is obscured at first sight in either case by a sweeping change in the cast and by a sudden and sensational increase in the size of the stage on which the tragedy is being played. Yet the post-Alexandrine Hellenic balance of power between Powers of a supra-city-state calibre was nevertheless historically continuous with a previous balance between city-states that had been in play from 478 to 338 B.C., and the latter-day Western balance, brought into play by the French invasion of Italy in A.D. 1494, was likewise historically continuous with a previous balance between Late Medieval city-states, or agglomerations of them, in Northern and Central Italy.

If we chose, we could proceed to analyse each of these earlier chapters in the three stories on the lines that we have now worked out. For example, we can discern that the pre-Alexandrine Hellenic balance of power was brought into play in 478 B.C. by the splitting of a Pan-Hellenic coalition which had been formed in 480 B.C. against the Achaemenian Empire, and that it was brought to an end in 338 B.C. by the formation of a new coalition against the same common adversary. Again, in the history of the pre-Confucian Sinic series of war-and-peace cycles, we can discern a cycle, running from 634 to 506 B.C., in which the *Leitmotiv* was an inconclusive struggle for hegemony between Ch'u and Tsin, and an overture to this cycle in which the decay of the oecumenical Ch'ou Power was giving ever larger opportunities for a number of local Powers to assert their independence and to enter into competition with one another. We can date the beginning of this overture from the

¹ Augustus's achievement of establishing a universal state in the Hellenic World in 31 B.C. had been anticipated in the Sinic World, 190 years earlier, by Ts'in She Hwang-ti's establishment of a universal state there in 221 B.C. Neither the post-Alexandrine nor any other episode in Hellenic history overlapped chronologically with any episode in Western history, since the Western Society sprang from the Hellenic Society's ruins, as the Hellenic, in its day, had sprung from the ruins of the Minoan. If we can trace the Western Civilization back to the close of the seventh century of the Christian Era, and the Hellenic back to the close of the twelfth century B.C., we shall reckon the 'interval' between them to have been of the chronological magnitude of about 1,800 years.

recognition by the Chóu Imperial Government in 680 B.C. of the hegemony with which the parochial state of Ts'i had been invested in 681 B.C. by four of the minor central states;¹ or, as an alternative initial date, we can take the overrunning of the capital city of the Chóu by the western barbarians in 771 B.C.²—a catastrophe which invited the Chóu Power's parochial feudatories to assert *de facto* their independence of a suzerain who had now flagrantly forfeited his claim to exercise his authority over them by having shown himself incompetent to perform any longer his oecumenical task of defending the common frontier of the Sinic World against barbarian attacks. On a similar reckoning, the beginning of the overture to the play of the Late Medieval balance of power between Northern and Central Italian city-states could be dated from the beginning of the process of political consolidation which reduced the number of states in Northern and Central Italy from seventy or eighty to ten in the course of the fourteenth and fifteenth centuries of the Christian Era,³ while an alternative initial date for this episode of Western history would be the death in A.D. 1250 of the Holy Roman Emperor Frederick II—an event which had for its consequence the reduction of the Holy Roman Empire to the condition of practical impotence into which the Chóu Empire lapsed after the catastrophe of 771 B.C.

Our survey of war-and-peace cycles could, indeed, be carried far and wide. In the Sumeric World, for example, there was a balance of power between contending parochial states that was in play for centuries before it was brought to an end by the establishment of a Sumeric universal state in the shape of Ur-Engur's (*alias* Ur-Nammu's) Empire of the Four Quarters, and in the Egyptiac World a twentieth-century Western historian might guess, pending a recovery of the missing records, that there must have been a similar prelude to Narmer's establishment of a United Kingdom.⁴ Nor need we confine our investigations to struggles in which the parties are contending states and in which the denouement is the elimination of all the competitors save for the one surviving victor Power whose victory converts her from a parochial state into an oecumenical empire.

In examining the history of a post-Alexandrine Hellenic Balance of Power, we have observed already⁵ that, in the last two cycles of this series, the bouts of warfare took the form of civil war and social revolution in place of the international warfare between parochial sovereign states through which the same current of violence had discharged itself before that vent had been stopped by the elimination, in the course of the preceding cycle, of all the Great Powers of a post-Alexandrine Hellenic World except Rome. We may now go on to remind ourselves that this alternating rhythm of bouts of war and spells of peace did not cease to manifest itself in the Hellenic World after the inauguration of a *Pax Augusta* in 31 B.C., any more than it had ceased after the assertion of Rome's oecumenical supremacy in the Reduplicated General War of

¹ See Maspéro, *op. cit.*, pp. 299-300.

² See *ibid.*, pp. 63-64; Hirth, *op. cit.*, pp. 176-7.

³ See III. iii. 355.

⁴ See p. 687, below.

⁵ See p. 271, above.

220-189 B.C. and the confirmation of this result in the supplementary wars of 171-146 B.C. In the forms of civil war, social revolution, and barbarian invasion, the rhythmic bouts of disorder continued to recur throughout the history of an Hellenic universal state which Augustus had founded and which Diocletian afterwards rehabilitated, until the onset of a final bout of such severity that this time the moribund society was unable to rally its depleted vital forces. There was the eruption of A.D. 66-70; the convulsion, ending with the accession of Diocletian in A.D. 284, whose beginning may be dated from the assassination of Alexander Severus in A.D. 235 or indeed from the death of Marcus Aurelius in A.D. 180; and the recurrent convulsion of A.D. 376-394, which proved fatal to the Empire in the West and which was followed in the Centre and the East by a likewise fatal seizure after Justinian's death in A.D. 565.

We could go on to analyse on the same lines the histories of other universal states that we have identified in this Study, and, besides taking account of social revolutions, civil wars, and barbarian invasions, we could also bring into our panorama the warfare with neighbouring Powers representing alien civilizations. The Roman Empire, for example, served from 64 B.C. to A.D. 632 as the warden of a post-Alexandrine Hellenic World's marches over against a resurgent Syriac Power clothed in the successive forms of the Arsacid and the Sasanid Empire;¹ and an Ottoman Empire which had provided the main body of Orthodox Christendom with an alien universal state found itself recurrently at war with Hungary and Hungary's successor the Hapsburg Monarchy in the Danube Basin, with Venice and with Spain in the Mediterranean, and with the Safawi Power in South-West Asia.

Our purpose, however, is, not to make an exhaustive survey of war-and-peace cycles, but to carry our investigation far enough to assemble adequate evidence for judging whether there is, or is not, any uniform common rhythm discernible in different series of such cycles that are sufficiently remote from one another in date and location to be reasonably regarded as being mutually independent; and for this positive purpose a wider expansion of our field of vision might be less illuminating than a closer comparative view of the three series that we have now examined in some detail. We may therefore conclude the present chapter by juxtaposing our three series with an eye to ascertaining whether the likeness between them, which we have already observed, is no more than a similarity in their general structure, or whether it extends to a chronological correspondence between the lengths of the Time-spans of the alternating bouts of warfare and spells of peace out of which this more or less uniform structure is built up in all three episodes.

The accompanying table² sets out, side by side, the data presented separately in the three preceding tables displaying successive occurrences of the war-and-peace cycle in Modern and post-Modern Western history, in post-Alexandrine Hellenic history, and in post-Confucian Sinic history respectively. In each of the three triple columns of dates in Table IV, the dates in the column on the left are the historical dates of

¹ See I. i. 75.

² Table IV, opposite.

the major alternating transitions from bouts of war to spells of peace and vice versa, as these stand in the preceding table recording the particular series—Western, Hellenic, or Sinic, as the case may be—which this column reproduces. Dates of transitions from peace to war are printed in roman type, dates of transitions from war to peace in italics. The

¹ Dates of turning-points from peace to war are printed in roman type, dates of turning-points from war to peace in italics. Dates enclosed in square brackets are those of minor turning-points.

² A transposed date is marked with an asterisk when it falls more than ten years wide of the corresponding historical date with which it is being brought into comparison.

³ Date of the outbreak of war over the inheritance of the Burgundian Valois Duke Charles the Bold.

⁴ Date of the peace-settlement partitioning the inheritance of Charles the Bold between the French Crown and the Burgundian Valois-Hapsburgs.

⁵ Date of the liquidation of Eumenes.

⁶ Date of the formation of the coalition against Antigonos Monophthalmus.

dates between square brackets in these left-hand columns are those of minor transitions which, in the tables, are identified in footnotes. The pair of dates between round brackets by which each of the dates in the left-hand columns is accompanied are transpositions of the corresponding dates in each of the other two series into terms of the historical series represented by the dates on the left hand of each triple column. An Hellenic date is transposed into a Western date by the addition of 1,800 years, and into a Sinic date by the subtraction of 190 years, on the reckoning that the Western Civilization emerged about 1,800 years later

than the Hellenic (i.e. *circa* A.D. 675 as against *circa* 1125 B.C.) and that the Sinic episode resulted in the establishment of a universal state 190 years earlier than the date of the corresponding denouement in the Hellenic episode (i.e. in 221 B.C. as against 31 B.C.). On the same reckoning, a Western date is transposed into an Hellenic by the subtraction of 1,800, and into a Sinic by the subtraction of 1,990 years; a Sinic date into an Hellenic by the addition of 190 years, and into a Western by the addition of 1,990 years.

Transposed dates, calculated in accordance with these scales, which fall more than ten years wide of the corresponding historical date in the series with which they are being brought into comparison, are marked with an asterisk; and it will be seen that, out of 84 transposed dates within the round brackets in our table, 22 fall outside, and 62 inside, this range of chronological proximity to the historical dates of which they are the equivalents. It will also be seen that, while the conspicuous 'misses' thus amount to something more than 25 per cent. of the total number of 'shots', and the approximate 'hits' to something less than 75 per cent., the comparison between the three series which reveals this surprising degree of coincidence¹ is simply a comparison of turning-points marking alternations between bouts of war and spells of peace. As soon as we introduce the distinctions that we have drawn between 'general wars' and 'supplementary wars' and between 'breathing spaces' and spells of 'general peace', we shall see that, as often as not, the correspondences apparent in the present table do not extend to these qualitative differences between bouts and spells of different characters. For example, the chronological correspondence between the Western bout of war running from A.D. 1536 to A.D. 1559 and the Hellenic bout of war running from 266 B.C. to 241 B.C. is very close; but, whereas the Hellenic bout in question ranks as 'a general war' in our analysis, the corresponding Western bout ranks as a set of supplementary wars. Moreover, in several cases, a major turning-point in one series has for its counterpart in one of the two other series a turning-point that is merely a minor one.

Our table does, on the other hand, enable us to calculate the average Time-span of the intervals between turning-points marking major transitions from spells of peace to bouts of war and vice versa. In our confrontation of the Western and the Hellenic series, apart from the Sinic, there are thirteen of these intervals within a total Time-span amounting to 286 years (A.D. 1477-1763) in the Western series, and fifteen of them within a total Time-span amounting to 290 years (321 B.C.-31 B.C.) in the Hellenic series. A division of the average length of these two Time-spans, which works out at 288 years, by the average of the two numbers of intervals, which works out at fourteen, gives us an

¹ The writer must confess that he was surprised to find this degree of chronological correspondence between the three series of dates—the more so because his conscience did not convict him of having procured 'a pre-established harmony' by any designing manipulation of the figures when he was compiling the three tables out of which the present table has been composed. The tables of war-and-peace cycles in Modern and post-Modern Western history and in post-Alexandrine Hellenic history were compiled by him in A.D. 1929; the table of war-and-peace cycles in post-Confucian Sinic history in A.D. 1950; and it was not till after he had compiled this third table that he thought of bringing the three tables together into a synoptic view.

average interval of 20.57 years between turning-points, and an average wave-length of 41.14 years between successive turning-points in one or other of the two directions either from peace to war or from war to peace. In our confrontation of all three series, there are eleven intervals between turning-points marking major transitions within a total Time-span of 269 years (A.D. 1494-1763) in the Western series and of 276 years (497 B.C.-221 B.C.) in the Sinic, while in the Hellenic series there are fifteen intervals between turning-points marking major transitions within a total Time-span of 284 years (315 B.C.-31 B.C.). A division of the average length of these three Time-spans, which works out at just over 276 years, by the average of the three numbers of intervals, which works out at twelve and one third, gives us an average interval of 22.38 years between turning-points and an average wave-length of 44.76 years between successive turning-points in the same direction.

These average figures are perhaps not of any great significance, considering that, in our analysis of the Western series of war-and-peace cycles, we have found that the overture was on a very much shorter Time-scale than any of the ensuing regular cycles, and also that, in the course of these, there was a tendency for the bouts of war to become shorter and the spells of peace longer. The approximate correspondence in wave-length between these regular Western war-and-peace cycles and the contemporary Western 'long' business cycles¹ may well prove more illuminating.² The total Time-span of these three cycles amounted to 346 years (A.D. 1568-1914), and within this period there were twelve intervals between major turning-points. The average length of an interval between turning-points in these three regular Western war-and-peace cycles was thus 28.83 years, while the average wave-length between successive turning-points in the same direction, either from peace to war or from war to peace, was 57.66 years. It will be seen that these two Time-spans are respectively of about the same order of magnitude as the twenty-two-to-twenty-five-years-long 'Rostow-Spiethoff' phases of alternating economic booms and depressions and as the 'Kondratieff' economic cycles with a wave-length of something between forty and sixty years.

2. *The Disintegrations and Growths of Societies*

'Laws of Nature' in the Disintegrations of Civilizations

In our foregoing investigation of war-and-peace cycles in three episodes occurring in the histories of three different civilizations, we have found indications suggesting that these rhythmical fluctuations were, in each episode, the products of a tension between two conflicting tendencies. A tendency to keep the balance perpetually in play by taking action to right it whenever it was in danger of being overturned was in each case countered, and eventually overcome, by a tendency for the recurrent wars through which a disturbed equilibrium was periodically readjusted to become progressively more severe in their incidence on Society until a point was reached at which the 'temperate and undecisive contests',

¹ See pp. 230-2, above.

² See p. 322, below.

which once, perhaps, had more or less satisfactorily fulfilled their regulative purpose, came to defeat the intentions of statesmanship by escaping from its control and rankling into enormities which were bound, sooner or later, to liquidate themselves either by destroying the society on which they had come to prey or alternatively by moving a society whose life was now at stake to terminate this series of ever more destructive wars between parochial states by allowing all the contending pieces but one to be swept off the board.

The self-amortization of a cyclic rhythm which thus proves to be the dominant tendency in struggles for existence between parochial states has previously come to our notice in our study of the disintegrations of civilizations; and it is not surprising that there should be this visible affinity between the respective rhythms of two historical processes that are manifestly bound up with one another. Our study¹ of the breakdowns in which the disintegrations of civilizations have originated has shown us that a frequent occasion, symptom, and even veritable cause of breakdown has been the outbreak of a war between parochial states in which a perennial evil that has previously been kept under control and been practised with moderation now disconcertingly lights up, in one of its periodical recurrences, to a degree of intensity that is so unprecedentedly severe as to constitute a deadly danger to the society's survival. In the pre-Alexandrine chapter of Hellenic history, for example, the Atheno-Peloponnesian 'reduplicated general war' of 431-404 B.C. was a scourge of this unprecedentedly lethal kind, as contrasted with the relatively moderate warfare with one another in which the Athenian and the Lacedaemonian faction in an Hellenic body politic had been indulging down to that date since their split in 478 B.C. In the pre-Confucian chapter of Sinic history, similarly, the great war of 634-628 B.C., in which the principal belligerents were Tsin and Ch'u, marked a corresponding climacteric crisis in a series of cycles of warfare between parochial states.

In our examination of three series of this kind, we have also noticed² that the replacement of a litter of contending parochial states by a single oecumenical power is apt to be followed, not by an entire cessation of recurrent outbreaks of anarchic violence, but by their translation from the previous form of wars between parochial states into the alternative form of civil wars and social disorders; and, if we thus find that the establishment of a universal state does not inevitably bring to an end the alternating rhythm of War and Peace generated by an antecedent Balance of Power between parochial states, it is more patently evident that this achievement of constructive statesmanship, magnificent though it is, does not avail to reverse, and so avert, a process of disintegration which it temporarily arrests.

We have observed³ that—in the histories of civilizations down to the time of writing—the disintegrations of civilizations, like the struggles for existence between parochial states through which the breakdowns of civilizations had been precipitated, had run their course in a series of rhythmic fluctuations; and an empirical survey of ten examples—leaving

¹ In IV, *passim*, in vol. iv.

² On pp. 271 and 283, above.

³ In V. vi. 278-321.

out of account a lost Minoan and an uncompleted Western record—has enabled us to ascertain¹ that the cyclic rhythm of Rout-and-Rally in which the dominant tendency towards disintegration has fought out its long battle with a resistance movement has been apt—apart from cases in which the domestic history of a society has been thrown out of its own course by the impact of an alien body social—to take a run of three-and-a-half beats—rout-rally-relapse-rally-relapse-rally-relapse—in accomplishing the historical journey from the breakdown of a civilization to its final unretrieved dissolution. The first rout throws the broken-down society into the first paroxysm of 'a Time of Troubles' which is relieved by the first rally, only to be followed by a second, and usually more violent, paroxysm that is brought on by a relapse. This relapse is followed, in its turn, by a second rally which is more robust and more durable than the first inasmuch as it manifests itself in the establishment of a universal state; and, when a further relapse eventually supervenes nevertheless, the universal state manages to stage a recovery. This third rally, however, is the last that the disintegrating Civilization finds the strength to make. When, thereafter, the universal state is smitten by a second paralytic stroke, this is the end, not only of this oecumenical body politic, but also of the body social whose life the universal state has prolonged by incapsulating it in a carapace.

It will be seen that the drama of Social Disintegration has—to judge from performances up to date—a more precise and regular plot than the drama of the Balance of Power. In this drama of Disintegration the number of the acts seems to be normally three-and-a-half. We may now go on to observe that the regularity of the structure of the plot of this play is matched by a uniformity in the length of the time that this plot takes to work itself out. If we study our table of universal states,² we shall find that—in cases in which the course of events is not disturbed by the impact of alien bodies social—a span of some four hundred years is apt to be occupied by the movement of rout, rally, relapse, and more effective rally running from the initial breakdown of the civilization to the termination of its Time of Troubles through the establishment of its universal state, and a further span of about the same length—some four hundred years again—by the ensuing movement of recurrent relapse, last rally, and final unretrieved relapse running from the establishment of the universal state to its dissolution. The standard Time-spans both of Times of Troubles and of universal states would thus appear to be of the order of four centuries each;³ but a universal state is apt to die hard, even after it has been overtaken by the deadly second stroke. A Roman Empire which went to pieces in the socially backward western provinces on the morrow of the catastrophe at Adrianople in A.D. 378 did not go

¹ See *ibid.*, especially pp. 278–87.

² Printed in vol. vi, on p. 327, and reproduced in vol. vii, as Table I, on p. 769.

³ Ibn Khaldūn, whose survey of universal states was limited in range to the special class of empires founded by Nomads (see III. iii. 475), reckons the standard duration of an empire at *circa* 120 years, i.e. at a Time-span running to three generations of 40 years each (see his *Muqaddamāt*, French translation by de Slane, Baron McG. (Paris 1863–8, Imprimerie Impériale, 3 vols.), vol. i, pp. 348–50). This number of generations is, in truth, the normal term for Nomad empires *in partibus agricoliarum* (see the present Study, III. iii. 24–25).

the same way in the central and eastern provinces until after the death of Justinian in A.D. 565. Similarly, a Han Empire which had met with its second stroke in A.D. 184, and which broke up thereafter into 'the Three Kingdoms', managed to reconstitute itself for a moment in the empire of the United Tsin (*imperabat* A.D. 280-317) before going into its final dissolution in the fourth century of the Christian Era.

In cases in which the dissolution of a broken-down civilization has been followed by the emergence of an affiliated civilization there has usually been an interval of some three hundred years between the date of the declining civilization's last, and fatal, stroke and the earliest date at which the rising civilization becomes visible above the historical horizon. Considering that this intervening chronological interregnum is apt to be filled to some extent by a 'die-hard' epilogue to the history of the moribund antecedent civilization's universal state,¹ we have to reckon that the process of disintegration may exceed its minimum Time-span of some eight hundred years, running from the initial breakdown of the society itself to the second breakdown of its universal state, by trespassing on a subsequent interregnum which gives scope for an epilogue of any length up to a limit of three hundred years. The maximum Time-span of the disintegration process thus turns out to be of the order, not of eight centuries, but of eleven.

Within the minimum Time-span of eight hundred years, the six intervals between turning-points, into which the three complete cycles of Rout-and-Rally can be analysed, fall into two groups, consisting of three intervals each, which are of approximately equal aggregate length. The first run of four centuries, constituting the Time of Troubles, is occupied by a down-swing between the original rout and the first rally, an up-swing between the first rally and the ensuing relapse, and a down-swing between this relapse and the second rally. This second rally, which occurs at the half-way point on the eight-hundred-years-long total course, brings with it the establishment of the universal state, and the second batch of four centuries, during which a *pax oecumenica* prevails, is occupied by an up-swing between the second rally and a further relapse, a down-swing between this further relapse and a final rally, and an up-swing between this final rally and a final unretrieved relapse in which the fabric of a long-since-disintegrating society now dissolves in a social interregnum. While either group of three intervals between turning-points is thus apt to occupy a span of four centuries in the aggregate, there is no indication in the historical evidence of any corresponding tendency, within each of these four-hundred-years-long spans, for the three intervals occupying it to be uniform with one another in their length. On the contrary, it looks as if the chronological articulation of these intervals within any four-hundred-years-long span were highly elastic; for in any one example of the series they are apt to differ from one another in duration, and these differences in their duration which thus present themselves within the history of each disintegrating civilization also seem to differ, from case to case, in the ratio in which they stand to one another. There does not seem to be any uniform ratio be-

¹ See V. vi. 210-13.

tween the different lengths of the successive intervals that is common to all the divers examples of this series of intervals in the histories of different civilizations.

'Laws of Nature' in the Growths of Civilizations

When we turn our attention from Social Disintegration to Social Growth, we shall recollect our finding, at a previous stage of this Study,¹ that Growth, as well as Disintegration, exhibits a cyclically rhythmic movement. Growth takes place whenever a challenge evokes a successful response that, in turn, evokes a fresh challenge that is not identical with the preceding challenge by which the creatively provocative response has been elicited. We have not found any intrinsic reason why this process should not repeat itself *ad infinitum*, even though a majority of the civilizations that had come to birth down to the time of writing might have failed, as a matter of historical fact, to maintain their growth by managing, for more than a small number of times in succession, to make a response that had been both an effective answer to the challenge that had called it forth and at the same time a fruitful mother of a new challenge demanding a new response.

We have seen, for example,² that in the history of the Hellenic Civilization the initial challenge of an anarchic barbarism, which was the legacy of the break-up of an antecedent Minoan Civilization's universal state, evoked an effective response in the shape of a new political institution, the city-state, which was perhaps created by ship's companies of refugees who were cast up upon the eastern shores of the Aegean Sea in the course of a post-Minoan interregnum (*durabat circa* 1425-1125 B.C.); and we have noticed in the same context that the very success of this response to a challenge on the political plane evoked, in its turn, a fresh challenge, this time on the economic plane, in the shape of the rising pressure of a population whose natural increase was now no longer being kept in check by battle, murder, and sudden death as drastically as it had been before the return of law and order accompanying the rise of city-states.

This challenge presented to the Hellenes by the pressure of population upon the means of subsistence, in a physical environment in which Nature set rigid limits to the increase of agricultural production, evoked, as we have seen, a number of alternative responses of unequal efficacy. There was the disastrous Spartan response of conquering the fields of the Spartans' Messenian next-door-neighbours within their common Hellenic homeland; there was the temporarily effective Corinthian and Chalcidian response of winning new fields for Hellenes to plough overseas in lands wrested from more backward peoples in the Western Basin of the Mediterranean; and there was the permanently effective Athenian response of increasing the aggregate productivity of this enlarged Hellenic World—after its geographical expansion had been brought to a halt by the concerted resistance of Phoenician and Tyrrhenian competitors³—

¹ In III. iii. 119-27.

² *Ibid.*, pp. 120-2. See also I. i. 24-26; II. ii. 36-49; and III. iii. 139-40 and 197-8.

³ See I. i. 24-25; II. ii. 38-42; III. iii. 122; and IX. viii. 436.

through an economic revolution in which an undifferentiated economic régime of subsistence farming was replaced by a differentiated régime of cash-crop farming and industrial production for export in exchange for imports of staple foods and raw materials.

This successful Hellenic response to the economic challenge of a rising pressure of population evoked, as we have also seen, a further challenge on the political plane;¹ for a now economically interdependent Hellenic World required a political régime of law and order on an oecumenical scale; the existing régime of parochial city-state dispensations, which had fostered the rise of an autarkic agricultural economy in each isolated patch of plain in an original Hellas round the shores of the Aegean and thereafter also in a Magna Graecia in the Western Mediterranean, no longer provided an adequate political structure for an Hellenic Society whose economic structure had now come to be unitary. This third challenge in Hellenic history—the challenge to transcend the city-state and to create a polity of oecumenical dimensions—was not met by the Hellenes in time to save the growth of the Hellenic Civilization from being cut short by a breakdown.

In the growth of the Western Civilization we can descry a concatenation of successive challenges evoking effective responses evoking new challenges which surpasses the Hellenic concatenation by running to as many as three completed links, as contrasted with the two which were all that a growing Hellenic Civilization succeeded in forging.

The initial challenge with which a nascent Western Society was confronted was the same challenge of an anarchic barbarism that had confronted a nascent Hellenic Society; the break-up of the Roman Empire and the break-up of 'the thalassocracy of Minos' bequeathed an identical legacy to their respective heirs; but the Franks' response to this identical challenge was not the same as the Hellenes'. Whereas the Hellenes had mastered anarchy by creating a parochial political institution in the shape of the city-state, the Franks mastered anarchy by creating an oecumenical ecclesiastical institution in the shape of the Hildebrandine Papacy;² and the meeting of an identical challenge along these different lines evoked a new challenge of a different character. A growing Western Civilization that had now achieved an oecumenical unity under the ecclesiastical aegis of the Papacy found itself in need of a politically and economically efficient parochial state; and this need was met by the resuscitation of the Hellenic institution of the city-state in a Medieval Western Italy and Flanders.³

These local materializations in the Western World of an Hellenic institution on its original miniature scale were not, however, more than a foretaste of the response which the Western Society had to make to the challenge that it was facing; for the late Medieval city-state cosmos⁴ extending from Central and Northern Italy through Southern and Western Germany to Flanders did not embrace more than a fraction of the Western World of the day, and the city-state itself was not an institution that could be grafted, *tel quel*, on to the medieval feudal monarchies of

¹ See IV. iv. 206-14.

³ See pp. 7-8, above.

² See IV. iv. 512-32.

⁴ See III. iii. 299-300 and 341-8.

vastly larger geographical dimensions which were the typical parochial polities of the Western World taken as a whole. Accordingly, the locally effective response, in the shape of the resuscitation of the Hellenic city-state, which Italy and Flanders had made to the need for an efficient form of parochial polity, presented the rest of the Western World with a new challenge. Could the solution of the problem of creating efficient parochial organs of Western political and economic life, which had been attained in Italy and Flanders through the resuscitation of an Hellenic institution, be harvested for the Western World as a whole by translating this Italian and Flemish efficiency from the city-state to the nation-state scale?

This problem, in its turn, was solved, as we have seen, in England, first on the political plane through the successful injection of an Italianate efficiency into the Medieval Transalpine institution of parliamentary representative government,¹ and afterwards on the economic plane through the Industrial Revolution.² The Late Modern Western Industrial Revolution, however, like the Solonian Economic Revolution in Hellenic history, had the effect of replacing a parochial economic autarky by an oecumenical economic interdependence; and thus the Western Civilization found itself confronted, as a result of its successful response to a third challenge, with the same new challenge that had faced the Hellenic Civilization after its successful response to a second challenge in its history. Would a society that had now achieved economic interdependence on an oecumenical scale succeed in providing its unified body economic with the requisite unitary political framework? This challenge, which had been presented to the Hellenic Society before the close of the sixth century B.C. and had defeated it before the close of the fifth century B.C., had likewise been presented to the Western Society before the close of the eighteenth century of the Christian Era, when the eruption of Democracy and Industrialism had already threatened to put a demonic new driving force into the old institution of War. By the time of writing, mid-way through the twentieth century, this challenge had not yet been met by Western Man, but it had already become manifest to him that, if he were to be defeated by it, he would be unable to save his civilization from disaster.

These brief glances at the histories of the growths of the Western and the Hellenic Civilization suffice to show that there is no uniformity between them in respect of the number of the links in the concatenation of interlocking rounds of Challenge-and-Response through which social growth had been achieved in these two cases; and this negative conclusion would be neither confirmed nor impugned by an extension of our survey to the histories of other civilizations in their growth-stage; for, among these comparable cases, there was none in which the growth-stage itself had not been too brief, or in which a twentieth-century student's knowledge of the history of the society in this stage had not remained too scanty, to enable the historian to attempt an analysis even of the summary kind that we have just been making of this phase in the histories of the Western and Hellenic societies.

¹ See III. iii. 350-63.

² See IV. iv. 167-73.

If there is thus no indication of there being any uniformity in the number of the chapters in the history of social growth as between one civilization and another, there is also no evidence of there being any standard length to which the Time-spans of the successive chapters conform.

If, with an eye to this latter point, we look once again at the history of the growth of the Western Civilization, it might appear, perhaps, at first glance, as if each of the interlocking rounds of Challenge-and-Response through which the process of growth had been achieved in this episode had had something like a regular wave-length running to approximately four hundred years. This was in fact the Time-interval between the date of the emergence in the Western World of the nation-state, round about the turn of the fifteenth and sixteenth centuries of the Christian Era, and the foregoing emergence of the Hildebrandine Papacy round about the turn of the eleventh and twelfth centuries; and this earlier landmark in the history of the Western Civilization's growth is likewise separated by an interval of about four hundred years from the date of the emergence of the Western Civilization itself round about the turn of the seventh and eighth centuries. This appearance of uniformity of wave-length as between successive rounds of Challenge-and-Response in the growth-phase of Western history is belied, however, by an ominous absence, round about the turn of the nineteenth and twentieth centuries, of anything resembling the emergence of an effective Western political organization on the oecumenical scale in response to the challenge presented to the Western Civilization by its own previous success in providing itself with an efficient parochial form of polity on the nation-state scale. If the growth-process were in truth not merely cyclic but also periodic in the sense of proceeding through cycles with a uniform wave-length, the Western Society's current problem of establishing some kind of oecumenical order on the political plane ought to have been visibly on the way to solution by the year A.D. 1952; and the Western Civilization's actual failure to solve this problem up to date must indicate either that the appearance of a uniform four-hundred-years-long wave-length in the growth-process was an illusion or else that, by A.D. 1952, the Western Civilization had broken down.

The former of these two possibly alternative, but not necessarily incompatible, inferences was borne out by the irregularity of the date at which the Medieval Western renaissance of the Hellenic city-state had occurred. So far from being separated in Time by an interval of anything of the order of four hundred years from the antecedent emergence of the Hildebrandine Papacy and from the subsequent emergence of the nation-state, the renaissance of the Hellenic city-state in the Western World followed hard at the heels of the epiphany of the Hildebrandine Papacy and was indeed one of its immediate incidental effects, considering that a temporary Balance of Power in the struggle between a waxing Papacy and a waning Holy Roman Empire was the constellation of forces that gave the Medieval Western city-states in an intervening no-man's-land in Northern and Central Italy their opportunity to raise their heads.¹

Our reconnaissance of the history of the growth of the Western Civiliza-

¹ See III. iii. 345-6; IV. iv. 524; and p. 240, n. 2, above.

zation thus points to the negative conclusion that, in the process of social growth, the cyclic movement of Challenge-and-Response through which growth is achieved has no fixed uniform wave-length for the successive beats of the rhythm, any more than it has a fixed uniform number of beats beyond which the movement cannot go.

The upshot of our present inquiry therefore seems to be that the operation of 'laws of Nature' is as inconspicuous in the histories of the growths of Civilizations as it is conspicuous in the histories of their disintegrations; and in a later chapter we shall find grounds for thinking that this striking difference in appearances is not just an accidental and illusory effect of the fragmentariness of our information and the dullness of our understanding, but is inherent in an intrinsic difference in character between the growth-process and the disintegration-process themselves.

(d) 'THERE IS NO ARMOUR AGAINST FATE'¹

In studying the operation of 'laws of Nature' in the histories of civilizations, we have found that the rhythm in which these laws reveal themselves is apt to be generated by a struggle between two tendencies of unequal strength. There is a dominant tendency at work which prevails in the long run against repeated—and, in the short run, repeatedly successful—counteracting moves in which the recalcitrant opposing tendency asserts itself. The struggle sets the pattern of the action; the persistence of the weaker tendency in refusing to resign itself to defeat accounts for the repetitions of the encounter in a series of successive cycles; the dominance of the stronger tendency makes itself felt by bringing the series to a close sooner or later, instead of letting it go on repeating itself *ad infinitum*, as, in theory, it might perhaps go on if the two forces at work were of exactly equal potency.

On these lines we have watched² struggles for existence between parochial states following—through three or four cycles of wars fought on one side for the overthrow, and on the other side for the maintenance, of a Balance of Power—a course that in each case eventually overturns the Balance and terminates the struggle by liquidating all the competitors except one, whose sole survival has the effect of replacing a bevy of contending states by a unitary oecumenical empire. We have likewise watched³ the struggle between a broken-down society's tendency to disintegrate and an opposing effort to restore it to a lost state of health following, through three-and-a-half cycles of lapse and rally, a course that in each case eventually ends in a dissolution which is final inasmuch as, this time, the relapse is not even partially retrieved. In studying⁴ the operation of 'laws of Nature' in the economic affairs of an Industrial Western Society we have found expert investigators of 'business cycles' surmising that these repetitive movements of divers wave-lengths might prove to be waves rippling the surface of waters that were, all the time, flowing in a current whose headway would eventually bring these rhythmic fluctuations to an end by dissipating the particular conjunction of

¹ Shirley, James: *Death the Leveller*.

³ On pp. 287-91, above.

² On pp. 234-87, above.

⁴ On pp. 223-34, above.

economic and social conditions—a system of free competition for earning profits reckoned in terms of money—in which the series of Late Modern and post-Modern Western ‘business cycles’ had taken its rise. In the same connexion we may remind ourselves of our finding¹ that, when and where a conflict between a disintegrating civilization and bands of recalcitrant barbarians beyond its pale had passed over from a war of movement into a stationary warfare along the *limes* of a universal state, the passage of Time had been apt to militate against the professional defenders of the *limes* to the advantage of its barbarian assailants, until in the end the sagging dam had burst and the gradually accumulated flood waters of Barbarism had descended in a sudden devastating spate on the domain of a society whose defence had become at last an intolerably heavy tax on its resources. We may further remind ourselves of our observation² of a tendency for the native bent of a civilization to reassert itself, sooner or later, against the deflecting effect of the renaissance of some incongruous element artificially resuscitated from the ossuary of a dead antecedent culture.

The foregoing observations are all illustrations of our more general finding³ that cyclical movements in human history, like the physical revolutions of a cart-wheel, have a way of forwarding, through their own monotonously repetitive circular motion, another movement with a longer rhythm which, by contrast, can be seen to be a cumulative progress in one direction, even if we cannot be equally sure that this course has ever been set for it deliberately in execution of a plan. In each of the historical instances in which we have detected one of these finite series of cycles generated by a struggle between two tendencies of unequal strength, the stronger tendency of the two has been apt to bring the series to a close by eventually winning a decisive victory over its weaker opponent; but, of course, this denouement tells us no more about the winning tendency than that, in this particular episode, it has proved stronger than its opponent to a degree that has eventually availed to put an end to the unequal struggle. There is no warrant for interpreting these victories of one tendency over another *de facto Historiae* as victories *de jure Naturae*. Empirically observed matters of fact are not necessarily the outcomes of an inexorable fate; the *onus probandi* here lies with the determinist, not with the agnostic. The unwarranted assumption that the historical denouement whose historical occurrence has been recorded in retrospect must therefore have been predestined to occur, in the teeth of all possible variations in previous acts of the play, has been propounded as a *jeu d'esprit* in Lewis Carroll's fable of ‘the time-machine’;⁴ but the English mathematician C. L. Dodgson left it to his German confrère Oswald Spengler to crystallize this airy conceit into the ponderous dogma under which a man of genius has perversely buried the brilliant findings of his intuitive insight. This undocumented Determinism is the bane of many passages of Spengler's work besides the one—already quoted in this study⁵—in which the Western culture's reassertion of its

¹ In VIII. viii. 16–44.

³ In IV. iv. 34–37.

⁵ Spengler, O.: *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), p. 321, quoted on pp. 65–66, above.

² On pp. 62–73, above.

⁴ See V. vi. 214–15.

native bent against a fifteenth-century Italian renaissance of Hellenic art and letters is delineated with what would be a fine sense of historical reality if only the philosopher-hierophant had been content to present his findings as the matters of fact which they are—without importing the *ex cathedra* judgement that they are also the fore-ordained acts of an ineluctable Destiny.

After thus taking warning from the spectacle of Spengler's self-stultification against the error of reading the unproven operation of an hypothetical Destiny into secular tendencies in human affairs which have happened in the end to win decisive victories over a stubborn opposition, we may now proceed, without prejudice to a still open issue between Law and Freedom in History, to take note of certain other episodes in which some tendency has reasserted itself in the face of successive rebellions against it. Such resolutions of conflicting human forces, in which Spengler would see the hand of 'Fate', can be observed in the histories of the political fortunes of territories; in the histories of encounters between different civilizations; and in the histories of struggles between conflicting religious concepts, doctrines, and allegiances; and this rhythm is endemic in the history of Man, in which all those particular episodes are embraced.

There is a conspicuous rendering of this rhythm in the political history of North America since its incorporation into a Western World expanding overseas from a Western European nucleus.

The unitary physiography of North America, with its magnificent natural system of internal waterways providing means of through-communication from the delta of the Mississippi to the estuary of the St. Lawrence via the Great Lakes, manifestly gave this giant Northern Island of the Western Hemisphere a physical predisposition to become the unitary political dominion of some single one out of the litter of Modern West European national states that were in competition for the prizes of a Western Society's New World. The French pioneers of West European enterprise in North America were quick to perceive this geographical nius towards political unity, and they went on to take deliberate and systematic steps to bring the whole of North America under the all-embracing rule of the French Crown by entrenching themselves at both extremities of the central waterway and establishing a chain of connecting links inland between these two maritime terminals.¹

In the course of the hundred years ending in A.D. 1763 this grandly conceived and ambitiously initiated French enterprise was frustrated by two unforeseen developments to the disadvantage of France in her contest for the possession of North America with her rival Great Britain. In the first place the British colonies planted along the eastern seaboard outstripped French Canada and Louisiana in the growth of their population to an extent that more than made up for the handicap of a location—hemmed in between the Atlantic and the Appalachians—that was, in itself, much less favourable for expansion into the interior.² In the second place a French colonial population in North America that was now no

¹ See II. ii. 66–67.

² See *ibid.*

match for the neighbouring British colonial population, if left to its own resources, was deprived of indispensable support from the mother country in Europe in the hour of need by the ascendancy that the British Navy had gained over the French. Through the combined and cumulative effect of these two shifts in the Balance of Power, the French Crown not only failed to achieve its ambition of bringing the whole of North America under its own rule, but actually lost all its holdings on North American soil in the Seven Years War. Yet the peace settlement of A.D. 1763, which ratified this outcome of a Franco-British war over North America that had been smouldering, off and on, for some seventy years in effect, appeared to have disappointed French ambitions without invalidating the geographico-political conception on which these had been based. In declaring against France's design to unite the whole of North America under the French flag, the course of Modern Western history up to date had apparently substantiated the French 'geopolitical' thesis that a unification under one flag or another was the political dispensation to which North America was predestined by her physiographical structure. The fortunes of war might now have decided that the unifying West European Power was to be, not France, but Great Britain; yet in A.D. 1763 this might have looked as if it were only a superficial modification of a course of political events which seemed still to be moving steadily towards a now more than ever apparently inevitable ultimate goal of unity.

Nevertheless, within not more than twenty years of the disappearance of the French flag from North America in A.D. 1763, the peace-settlement of A.D. 1783 was to indicate that the dominant tendency in this North American episode of Western history was, not the *nisus* towards political unification that was inherent in the giant island's physiography and that, in A.D. 1763, had been momentarily translated into an accomplished political fact, but an inclination to fall apart, in defiance of physiography, into two separate political domains on lines foreshadowed in the competitive plantation of English and French colonies on North American coasts in the seventeenth century of the Christian Era. The political map of North America after A.D. 1783 was, and remained, in its general pattern, the same map of a politically partitioned island that it had been before A.D. 1763, with the two originally separate political domains once again separate under interchanged flags,¹ whereas the map of a politically united North American island, which had been a political reality between A.D. 1763 and A.D. 1775, turned out to have been merely History's passing tribute to a Physiography whose political requirements History was evidently bent on defying. After having per-

¹ While the French flag had disappeared from North America and the United States flag had made its epiphany there, the British flag had kept a footing on the North American island by contriving to supplant the French flag in Canada before it was supplanted, in its turn, by the Stars and Stripes in the United States. An English traveller *en route* by rail from New York to Montreal in A.D. 1952 would have the historically pregnant experience, at the moment when his train crossed the border, of re-entering the dominions of the sovereign whose subject he was and at the same instant passing out of the domain of his own English mother tongue into eastern counties of the Province of Quebec in which the place-names might be English but the prevailing language was unquestionably French.

mitted the British flag to supplant the French flag at Quebec and Montreal, History promptly reasserted her ascendancy over Physiography by seeing to it that the Stars and Stripes should replace the Union Jack from New England to Georgia inclusive.

The new flag that History had thus introduced into the North American landscape to serve her own anti-unitarian caprice was never allowed by her to defeat her intentions by achieving North America's physiographically manifest political destiny through any sly move behind History's back. During the War of A.D. 1812-14, no less than during the War of A.D. 1775-83, History kept a watchful eye open to make sure that the United States of North America should not surreptitiously put Canada into her pocket; and, in the course of the next hundred years after the negotiation of the peace treaty of Ghent, Clio made sure that the United States should continue to fulfil the North American designs that this officious Muse had had in mind when she had called into being the first Western sovereign independent national state to make its appearance on non-European ground; for, in the course of the nineteenth century, History led the people of the United States to lose all desire to annex Canada at the very time when she was putting it into their power to bring the whole of North America under the Stars and Stripes if they had still had any lingering ambition to make a seventeenth-century French dream come true.

This outcome of a tug-of-war in North America between two conflicting tendencies, making respectively for the political partition and for the political unification of the island, is an interesting case because the eventually frustrated *nisus* towards unity was favoured by physiographical forces which were as potent as they were obvious, whereas the ultimately victorious inclination towards partition was History's 'dark horse' in the field.

The 'fate' of North America to be partitioned into two separate political domains in spite of a physiographical structure which 'predestined' this island to attain political unity has an historical parallel in the 'fate' of the post-Diocletianic Roman Empire to lose possession of Italy, in the teeth of the historical fact that Italy had been the base of operations from which the Hellenic World had been knocked together into a universal state by Roman arms.

In the course of the fifth century of the Christian Era a post-Diocletianic Roman Empire lost Italy *de facto* to a series of North European barbarian war-lords—first to Ricimer (*dominabatur* A.D. 456-72), then to Odovacer (*dominabatur* A.D. 476-93), and then to Theodoric (*dominabatur* A.D. 493-526)—and this was not surprising, considering that, in the course of the thirty-seven years between A.D. 293, when Diocletian had officially established his headquarters at Nicomedia, and A.D. 330, when Constantine had celebrated the completion of his lay-out of a New Rome on the Bosphorus,¹ the political capital of an Hellenic universal state had already gravitated from an always eccentrically western location at Rome towards a borderline between the Central and the Oriental provinces which had always been the locus of the Roman Empire's eco-

¹ See VI. vii. 217-18.

monic centre of gravity. These facts were the politically pertinent facts when, in the fifth century, Italy slipped out of the Imperial Government's control; yet present political realities counted for less in determining the emotional reaction of Constantinople to the eclipse of the Imperial Government's authority in Italy in this age than the historic role once played by a Roman Italy in the creation of a Roman Empire in a past age which had long since become ancient history. The *de facto* sovereignty of barbarian war-lords in Italy was never recognized at Constantinople *de jure*; and the work of financial, economic, and military reconstruction, that a Constantinopolitan Imperial Government had gradually carried out during the fifth century in the Central and Oriental provinces,¹ had no sooner borne fruit in the accumulation of a reserve of public resources than this reserve was squandered by the sixth-century Constantinopolitan Emperor Justinian on the archaistic enterprise of re-subjugating Italy to the direct rule of a Roman Imperial Government.

This political objective was duly attained by Justinian at the cost of an eighteen-years-long war (*gerebatur* A.D. 535-53). But, within five years of the collapse of the last Gothic resistance to Roman arms on Italian soil in A.D. 563,² the laboriously reconquered Italian dominions of the Roman Imperial Crown were lost again to yet another war-band of barbarian invaders. The Lombard irruption into Italy, which broke upon her in A.D. 568, did not come to a standstill until it had robbed the Empire of the whole of Italy save for seven bridgeheads on the beaches³ and a line of isolated inland fortresses,⁴ strung along the road between Ravenna and Rome, which survived, like stepping-stones, amid an encompassing flood of Lombard invasion that had swirled round their walls on its torrential course from the Po Basin into the Abruzzi. This prompt resumption of the march of History in reply to Justinian's archaistically conceived counter-attack was even less surprising than the anticipation of a post-Justinianean Alboin's exploit by his pre-Justinianean forerunners Ricimer, Odovacer, and Theodoric; for Justinian's ephemeral conquest of Italy for a Constantinopolitan Roman Empire had been purchased at the threefold price of ruining the Empire's revenue-producing Oriental provinces, depopulating her military recruiting grounds in the Danubian provinces, and alienating the 'liberated' Italians by first devastating Italy in the act of exterminating the Ostrogoths and then wringing revenue out of her for the treasury of a Transadriatic Imperial Government to whose jurisdiction Italy had never been subject before her annexation to it by Justinian himself. In these circumstances it would have been a miracle if Justinian's conquest of Italy had had any enduring effect. The 'fate' of a post-Diocletianic Italy, unlike the 'fate' of a Modern North America, was, in fact, as clear as day from first to last, and even a

⁴ Of which Perugia was the most considerable.

Justinian could hardly have succeeded in remaining blind to it if he had not taken pains to reinforce a congenital myopia by putting on the blinkers of Archaism.

The 'fatality' of a post-Diocletianic Roman Empire's loss of Italy has its closest historical parallel in the loss of the Oriental provinces south of Taurus; for this loss, likewise, was no historical surprise. Though the Hellenic ascendancy in South-West Asia west of Euphrates was little less than a thousand years old by the time when, in the seventh century of the Christian Era, Arab *conquistadores* liquidated it almost as rapidly as Macedonian *conquistadores* had established it in the fourth century B.C., Hellenism had never succeeded south of Taurus—apart from a cluster of maritime Greek settlements on the Cilician Plain which had been planted in the pre-Alexandrine Age—in becoming anything more than an exotic alien culture, all but confined within the walls of a few Hellenic or Hellenized cities and only feebly radiating out from these into a still invincibly Syriac and Egyptiac agricultural countryside. Hellenism's capacity to achieve mass-conversions here had been put to the test by the Seleucid Hellenizer Antiochus IV Epiphanes (*regnabat* 175–163 B.C.) when he had set out to make Jerusalem as Hellenic as Antioch or Athens; and the resounding defeat of this cultural missionary enterprise had portended the ultimate total disappearance of the intrusive culture *in partibus Orientalium*. Indeed, the sporadic veneer of Hellenism which Epiphanes had so signally failed to transmute into solid timbers would have been stripped away before the opening of the Christian Era by Arab Nomad intruders from the Syrian Desert and Iranian Nomad intruders from Eurasia if Rome had not given Hellenism a further lease of life in South-West Asia and Egypt by stepping masterfully into the shoes of prematurely senile Seleucidae and Ptolemies. The wonder was that an anti-Hellenic resistance movement—which in Egypt had first gone into action as far back as the turn of the third and second centuries B.C.¹—should not have found an effective retort to an Hellenic ascendancy earlier than the same fifth century of the Christian Era that saw Roman Italy fall under the dominion of barbarian war-lords.

The Hellenic ascendancy over the Syriac and Egyptiac societies had been imposed and maintained by force of arms; and, so long as the subjugated societies had reacted by replying in kind, they had been courting defeat. When the Jews and Egyptians had been encouraged by the success of their insurrections against the epigoni of their Macedonian conquerors to try conclusions with the Roman heirs of those *peritura regna*², they had found to their cost that this Roman second wave of Hellenic domination had a more formidable momentum than its Macedonian forerunner. The discomfiture of Epiphanes at the hands of the Maccabees had been avenged on a Palestinian Jewry by a Titus and a Hadrian; and thereafter, when the temporary breakdown of the *Pax Augusta* in the third century of the Christian Era had given a militant Oriental resistance movement a fresh opportunity for trying its fortune, Zenobia's successor-state of the Roman Empire had gone the way, not of Mu'āwiyah's

¹ See V. v. 68.

² Virgil: *Georgics*, Book II, l. 498.

some four hundred years later,¹ but of Samsigeramus's successor-state of the Seleucid Empire some three hundred years earlier. In the next chapter of the story after the overthrow of Zenobia by Aurelian, the mass-conversion of the population of the Oriental provinces to Christianity, which had been consummated during the pre-Diocletianic bout of anarchy, might have seemed at the moment to have done for Hellenism incidentally what Epiphanes had once tried to do for it deliberately without success; for in the Oriental provinces a triumphant Catholic Christian Church had captivated a subject native peasantry and an urban Hellenic 'ascendancy' alike; and, since Christianity had been making its triumphal progress in an Hellenic dress, it looked as if the Orientals had now at last inadvertently 'received', in association with Christianity, a Hellenism which they had so vehemently rejected when it had been offered to them unadulterated and undisguised. This conclusion was not belied by the first of the schisms that rent the Christian Church after the Imperial Government, *imperante Constantino*, had given the Church its countenance; for the strife between Athanasians and Arians was not a cultural conflict between Hellenes and Orientals but a family quarrel between two rival factions of philosophizing Alexandrian Greeks. The subsequent breach between Catholics and Nestorians did, on the other hand, split the population of the Oriental provinces on communal lines; and, in thus resuming the Oriental resistance movement against Hellenism in the form of a theological controversy within the bosom of the Christian Church, the Orientals had hit upon a new technique of cultural warfare which eventually prevailed over a Hellenism that had shown itself to be invincible so long as the Orientals had been content to fight it on ground of Hellenism's choosing, and not of theirs.²

The series of Oriental counter-attacks on Hellenism in the form of Christian theological movements that were branded as 'heresies' by a dominant minority of 'Melchites'³ has come to our attention in divers contexts in this Study so many times already that in this place we may confine our observation of it to the point of noticing that this was one of those 'fateful' movements that advance towards an ultimate victory through successive defeats. When an Oriental resistance movement struck at Hellenism by way of a Nestorian Christian attack on a Catholic Christian Christology, an Hellenic Orthodoxy was still strong enough to be able to proscribe a Syriac Nestorianism within the frontiers of the Roman Empire—though not strong enough to prevent the banned Nestorians from finding a second home under a Sasanian political aegis, capturing the whole of the Christian community in the Sasanian dominions, and thereby winning for themselves the monopoly of a Christian mission-field extending overseas south-eastward into Southern India and overland north-eastward into Western China. When thereafter the same Oriental resistance movement struck a second stroke at Hellenism by way of a Monophysite Christian attack on a Catholic Christian

¹ The historical relation between Mu'āwiyah's and Zenobia's successor-states of the Roman Empire in the East has been noticed in I. i. 74, n. 4.

² See IX. viii. 413-14.

³ This nickname for the Catholic Christians which was applied to them by the Monophysites was a Graecized form of a Syriac word signifying 'Imperialists'.

theology—thus making a Christology that was the antithesis of the Nestorian serve the self-same purpose as a weapon of cultural warfare—an Hellenic Orthodoxy this time failed to drive the anti-Hellenic insurrectionary movement beyond the frontiers and merely played into its hands by succeeding in driving it underground. Underground and on the run, the missionaries of Monophysitism won the allegiance, *en masse*, of the submerged Egyptian and Syriac populations within the Roman Empire's borders, and they increased their following further by also winning the allegiance of the Armenians, who had been the first people in the World to adopt Christianity as their national religion.

These sweeping subterranean triumphs of a militantly anti-Hellenic Monophysitism unmasked an Hellenic 'ascendancy's' perennial weakness; for Hellenism had now come to be identified with an anti-Monophysite and anti-Nestorian Christian Orthodoxy, and it had become manifest that, within the bounds of the three Oriental Patriarchates of Alexandria, Jerusalem, and Antioch, 'the Melchites' were—as their invidious nickname indicated—no more than a dominant minority consisting of the sprinkling of Roman Imperial officials and soldiers stationed in these provinces, together with a handful of Hellenic townspeople and Hellenized landowners who looked to the Imperial authorities to maintain them in their position of privilege *vis-à-vis* a Monophysite Oriental peasantry. This native peasantry's overwhelming numerical preponderance over an intrusive Hellenic 'ascendancy' began to make its weight felt now that the people themselves were conscious of it thanks to their having acquired a Monophysite national church of their own to give them a heartening sense of solidarity, as well as an inspiring cause. Within thirty-one years of the breach between Orthodoxy and Monophysitism in A.D. 451, the Emperor Zeno had made public, in promulgating an 'Act of Theological Union' (*Henôtikon*) in A.D. 482, his conviction that the Imperial Government could no longer hope to retain its political hold over the economically indispensable Oriental provinces except at the price of theological appeasement; and, when the political exigencies of Justinian's vain enterprise of conquering Italy constrained this unstatesmanlike successor of Zeno's to abandon an appeasement of Monophysitism that was anathema to the Papacy, Justinian thereby consummated the alienation of his Oriental subjects without succeeding in his attempt to conciliate the Italians.

The moral secession of an Orthodox Christian Roman Empire's Monophysite Christian Oriental subjects now went with a run; in the Oriental provinces, as in Illyricum and Italy, the Constantinopolitan body politic had become a hollow shell by the date of Justinian's death (*decessit* A.D. 565); and there was no longer any prospect of its surviving the deluge which the archaist emperor had put in store for his own unhappy successors on the Imperial Throne. A shell that Khusrū II Parwīz so easily shattered and that Heraclius so painfully pieced together again would assuredly have fallen to pieces, past retrieving, thereafter, even if Monophysitism had been the last of the domestic Oriental heresies, and Khusrū's invasion the last of the foreign Oriental military assaults, to which the worm-eaten fabric of the Roman Imperial body politic had

been exposed. In raising up a successor to Nestorius and Eutyches in the person of Muhammad, and in unleashing the Primitive Muslim Arab assailants of the Empire at the heels of their Zoroastrian Persian predecessors, History was giving herself unnecessary trouble for the sake of making assurance doubly sure.

A 'Fate' that condemned the Roman Empire to lose both Italy and its Oriental provinces irretrievably in the end, in spite of the Imperial Government's obstinately repeated attempts to halt and reverse the remorseless march of History, asserted its power over the Achaemenian and Mauryan empires by the contrary move of constraining them to re-establish themselves sooner or later in new shapes after the militant intrusion of the Hellenic Society into the Syriac and Indic societies' domains had prematurely overthrown, first the Syriac, and then the Indic, universal state, before either of these had attained the term of four hundred years that seems to be the standard life-span of a polity of this species.¹ We have identified an avatar of the Achaemenian Empire in the Arab Caliphate, and an avatar of the Mauryan Empire in the Guptan Empire.² In the tug-of-war between an intrusive Hellenic Society's effort to absorb the Syriac and Indic societies' frayed social tissue into her own body social and the *nisus* of the two invaded societies to expel the invader, however tardily and at however high a cost, in order to resume and complete the regular course of a disintegrating society's history, we have another example, on the political plane, of a trial of strength between conflicting social forces working itself out in a series of successive rounds.

If we now pass from the political plane to the religious, we shall find here a counterpart of North America's 'fate' to be partitioned between two sovereignties in the 'fate' of France and England to be partitioned between two ecclesiastical allegiances.

In another context³ we have already noticed that, since the twelfth century of the Christian Era, the Roman Catholic Church in France had been engaged in a never more than temporarily successful struggle to re-establish the ecclesiastical unity of France as a Catholic country against an impulse towards secession which, from that time onward, kept on reasserting itself in some new form after each previous manifestation had been repressed. A revolt against Catholic Christianity which had taken the form of Catharism at its first outbreak in Southern France in the twelfth century was stamped out there in the thirteenth century in this form only to re-emerge in the same region in the sixteenth century in the form of Calvinism. Proscribed as Calvinism, it promptly reappeared as Jansenism, which was the nearest approach to Calvinism that was possible within the Catholic fold. Proscribed as Jansenism, it reappeared as Deism, Rationalism, Agnosticism, and Atheism. Every time that a repeatedly challenged Catholic Church seemed to have succeeded in reimposing a Catholic ecclesiastical unity upon France through an apparently conclusive victory over the dissenting movement of the day, the momentarily defeated forces of dissent thus baffled the victor by

¹ See p. 289, above.

³ In IX. viii. 609-10.

² See I. i. 76-77 and 86-87.

re-entering the lists under a fresh banner and in a new-fangled panoply. More than seven hundred years after the savage repression of the Albigenses had been completed in A.D. 1229,¹ France was farther than she had been at the twelfth-century zenith of Catharism's fortunes in Languedoc from an ecclesiastical unity that the Catholic Church had re-established in France by *force majeure* no less than three times over in the meanwhile. The Protean stratagem of metamorphosis had invariably saved a repeatedly defeated movement of religious dissidence from ever being stamped out for good and all; and, at the time of writing, mid-way through the twentieth century of the Christian Era, it looked as if this historic wrestling match between Proteus and Menelaus in a French ecclesiastical arena would end, unlike the fabulous incident in the *Odyssey*,² in Menelaus, not Proteus, giving up the game and capitulating on his opponent's terms.

This irrepressibly recurring rebellion in France against ecclesiastical unity under the auspices of the Roman Church has its counterpart in England in a likewise irrepressible rebellion against ecclesiastical unity under the auspices of an Episcopalian Protestant Established Church of England. An anti-episcopalian Protestant secessionist movement, which had raised its head in the course of the last quarter of the sixteenth century and had put down Episcopacy from its seat in A.D. 1643, was quashed in the form of Puritanism in and after A.D. 1662, only to re-assert itself in the form of Methodism in the eighteenth century. An Episcopalian Established Church of England, whose prelates might have imagined in A.D. 1662 that they had succeeded in their day in achieving an ecclesiastical uniformity that their redoubtable predecessor, Archbishop Laud, had failed to achieve in his, was living in the same ephemeral fool's paradise as the 'Melchites' on the morrow of a proscription of Nestorianism which had been the signal for the more baffling onset of Monophysitism. In England, as in France, by the middle of the twentieth century, the ideal of an authoritarian ecclesiastical unity had been demonstrated to be a lost cause by the repeated stultification of successive attempts to carry it to a conclusive victory.

In other contexts, again, we have noted the 'fate' of a Judaic Monotheism to be perpetually beset by a repeatedly resurgent Polytheism, and the 'fate' of a kindred Judaic concept of the One True God's Transcendence to be no less perpetually beset by a repeatedly resurgent yearning for a God Incarnate.

Monotheism put down the worship of Ba'al and Ashtoreth only to find a jealous Yahweh's rigidly proscribed traditional divine associates slyly creeping back into the fold of Jewish orthodoxy in the guise of personifications of the Lord's 'Word', 'Wisdom', and 'Angel',³ and afterwards establishing themselves within the fold of Christian orthodoxy, from the outset and as of right, in the doctrine of the Holy Trinity and in the cults of God's Body and Blood, God's Mother, and the Saints. These re-encroachments of Polytheism on Monotheism in the Christian Church, which were more flagrant than the re-encroachments in Juda-

¹ See IV. iv. 369, n. 4.

² *Odyssey*, Book IV, ll. 363-570.

³ See VII. vii. 718.

ism, evoked a whole-hearted reassertion of Monotheism in the shape of Islam and a less thoroughgoing reassertion of it in the shape of Protestantism; yet Protestantism confessed its nostalgia for the comfortable practices of an abandoned Roman Church by eventually ranking into Anglo-Catholicism, while a would-be meticulously monotheistic Islam was no more successful than Judaism or Protestantism or Catholicism in living up to its superhumanly etherial principles. Islam, in its turn, made the now familiar concessions to the Soul's irrepressible appetite for a plurality of gods. Even the Sunnah found its equivalent for a personified Word of God in an uncreated Qur'ān and acquiesced in a cult of saints which owed at least as much to the corresponding Christian practice as this owed to the cult of pagan Hellenic heroes and demigods, while a doubly heretical 'Alī Ilāhī sect had the courage of the Shi'ah's muffled convictions when it openly conferred upon 'Alī the apotheosis that Jesus had received from the Christian Church. The Christians' apotheosis of Jesus had been rejected as a relapse into Polytheism by 'Alī's own cousin and father-in-law the Prophet Muhammad. The yearning, manifest in the Shi'ah, to find a legitimate Islamic substitute for a proscribed Christian God Incarnate gives reason to Horace's dictum *Naturam expelles furcā, tamen usque recurret*.¹

These variations on the theme of a trial of strength between conflicting tendencies, in which the eventually defeated tendency kicks repeatedly against the pricks without succeeding in the long run in defying its 'fate', are all embraced in the drama of Man's 'fate' of having daily and hourly to purchase and re-purchase his right to Life and Freedom by perpetually responding to repeated challenges.

Nur der verdient sich Freiheit, wie das Leben,
Der täglich sie erobern muss.²

In our search for a criterion of the process of growth,³ we have found it in a cumulative success in responding to challenges which is rewarded, not by an exemption from Challenge which would be tantamount to a discharge from the active service of Life, but by a transfer of the field of challenge from a Macrocosm where God challenges Man through the agency of Non-Human Nature or of Man's fellow human beings to a Microcosm where God challenges Man through the agency of Man's own soul by an ineffable epiphany of God the Challenger Himself.

(II) POSSIBLE EXPLANATIONS OF THE CURRENCY OF 'LAWS OF NATURE' IN HISTORY

The Emancipation of Man's Work from the Day-and-Night Cycle and from the Annual Cycle of the Seasons by Civilization

The evidence for the amenability of human affairs to 'laws of Nature' that has presented itself in the foregoing survey of historical facts seems sufficient to warrant, and indeed to demand, an inquiry into possible explanations of the appearance of regularities and recurrences too well

¹ Horace: *Epistulae*, Book I, Ep. x, l. 24.

² Goethe: *Faust*, II. 11575-6, quoted in II. i. 277.

³ In III. iii. 192-217.

attested to be convincingly explained away. If these repetitions and uniformities have to be accepted as being realities, there are two obvious main alternative possibilities to be explored. The human affairs with which we are concerned in the present Part of this Study are, we may here remind ourselves, Man's psychic and spiritual affairs, as contrasted with his bodily physique and physiology, which, for our present purpose, we are treating as part of his non-human environment. If human affairs in this pertinent restricted sense of the term are subject to 'laws of Nature', these laws that govern them may be either laws current in Man's non-human environment which impose themselves on human affairs from outside by *force majeure* without having any more intimate relation than this with Human Nature, or alternatively they may govern human affairs in virtue of being inherent in the psychic structure and working of Human Nature itself. It may be convenient to look into these two possibilities in the order in which we have just mentioned them.

We may perhaps venture to start by making the assumption that, in the non-human provinces of Nature, there are 'laws of Nature' that are not only operative but manifest. Post-Modern Western men of science seemed to take the reign of Law over Non-Human Nature for granted, and, so far as the present writer was aware, post-Modern Western historians had not carried their Antinomianism to the length of challenging the *savants* of the non-human sciences on these sciences' own ground. Nor again did the historians seem to dispute the thesis that, in Man's non-human environment, there were some uniformities, regularities, and recurrences that had an effect on human affairs. Some of the astronomical cycles in the physical motion of the Stellar Universe are obvious cases in point.

The Day-and-Night Cycle, for example, manifestly affects 'the everyday life of ordinary people' in all human societies of every species, since human beings have an ineradicable physiological need for sleep at least once in every twenty-four hours, and night-time is the time for sleep that is indicated to Man by the physiological laws governing his body. Though fish-spearers, burglars, bakers, monks,¹ and journalists may be con-

¹ The monks of a monastery on Mount Athos in which the writer had been spending the night as a guest in June 1912 courteously expressed to him, the morning after, their hope that his sleep had not been disturbed by their frequent nocturnal celebrations of the Liturgy. Wishing to return his hosts' courtesy in kind, the writer on his side expressed the hope that the monks did not find these never intermitted night-long vigils too painfully exhausting. 'Not at all', replied the monks, 'considering that we are able to sleep in the day-time.'—'And how do you manage to do that?' their English guest inquired. 'O, well, because we have fine estates in Rumili, with peasants on them to work them for us. You will remember our showing you yesterday our arsenal at the water's edge, stored with provisions of grain, oil, and wine. All that comes from our estates, and the peasants have to deliver it to us at the arsenal by water.'—'And how do the peasants live?' I asked. 'O, the peasants live like dogs', said the monks, 'but you can see for yourself what an admirable arrangement ours is. As the peasants work for us and fetch and carry for us, instead of our having to do any of this for ourselves, we can afford to sleep in the day-time and so keep ourselves fresh for praying at night, and this is really most advantageous, as you can imagine. After all, most people in the World—including, perhaps, Your Honour (*τὸν λόγον σας*)—are in this respect in the less favourable position of our peasants. Having, as they do have, to work all day, they are forced to spend the night in sleep instead of in prayer, in order to be fit for work again next morning; so at night-time the volume of prayers reaching God is at a minimum, and this means that God can give to a prayer offered up to Him during the night an amount of individual attention that would be out of the question in the day-time, when the great majority of

strained by the exigencies of arduous professions to exchange the time-table of the common run of Man and Beast for the time-table of foxes, owls, and bats by working at night and sleeping in the day-time, these night-workers, no less than other people, conform to the astronomical rhythm of the Day-and-Night Cycle in their own topsy-turvy way; they merely turn inside out the ordinary human way of keeping in step with the planet's periodic rotation round its own axis. As for the majority of Mankind who sleep by night and wake by day, you can see them keeping time with the alternations of light and darkness in country life and in city life alike. The Moreot peasant who comes down every morning from his village on the crag to his field in the plain, and climbs up again every evening from the kambos to the kastro, is dancing to the same astronomical tune—played by the Earth's rotatory rhythm—as the New York business man who commutes between New Canaan and Manhattan or the New Yorker's Constantinopolitan confrère who makes the shorter daily 'round trip' between Asia and Europe.¹ All the same, by the writer's day, Man in Process of Civilization had contrived to break the chains even of this physiologically imperative Day-and-Night Cycle. He had extricated himself from his servitude to this particular law of Physical Nature by inventing the double shift. An organizational device that was being practised already in a post-Minoan heroic age by Laestrygonian herdsmen, who had tumbled to it thanks to living far enough north to know summer days that ran into one another without any intervening nights,² had been adopted before the writer's day in all latitudes by the navigators of the high seas and by the industrial workers on the *terra firma* of a Westernizing planet. By this trick of putting Mycerinus³ into commission, the scientific managers of a latter-day Western industry had translated an Egyptian fairy tale into a prosaic reality.⁴

Another astronomical cycle to which Man had been a slave was the Annual Cycle of the Seasons; and, though this Summer-and-Winter Cycle did not impinge upon Man directly, as the Day-and-Night Cycle did, by communicating its rhythm to the human body's physiological demands, it had exercised a hardly less potent indirect dominion over Man's life through its direct dominion over a physical environment out of which Man had to wring his livelihood and, beyond that, to gather a surplus, above the minimum required for bare subsistence, to spend on war

Mankind are awake and in the running to gain a hearing for their prayers at odd moments of their working day. Yes, thanks to the endowments bequeathed to us by pious benefactors, we monks do find ourselves in a decidedly advantageous position.'

¹ In this comparison the relevant point for our present purpose is the regulation of the rural and the urban worker's daily round alike by the cyclic motion of the Earth's night-and-day clock. It is true, of course, that the journey which these two kinds of workers make, in one direction every morning and in the reverse direction every evening, is forced upon them by diverse considerations. The peasant is moved to commute by the insecurity of his field of work, the business man by its congestion; but this diversity of motive for an identical daily shuttling movement is irrelevant to our present inquiry.

² See *Odyssey*, Book X, ll. 81-86.

³ The tale of Mycerinus is told by Herodotus in Book II, chap. 133.

⁴ The successive shifts of hands, through which a latter-day Western plant was kept in operation for twenty-four hours in the day, had been anticipated in the successive watches through which a ship had been enabled to hold on her course for twenty-four hours in the day without having to be beached each night in order to allow the crew to sleep ashore.

against his fellow human beings in a World which, so far, had not succeeded in attaining to an all-embracing permanent political unity under the rule of a single effective World Government. The Cycle of the Seasons, generated by a daily rotating Earth's annually recurrent movement round an orbit centred on the Sun, had set the clock for Man's military as well as for his economic activities in food-gathering, hunting, fishing, agricultural, and pastoral societies.¹

In the Age of the Civilizations, when the food-gathering and hunting societies had been either exterminated or driven into holes and corners, and when Farmer Cain had eventually established a decisive ascendancy over Shepherd Abel,² the husbandman's dance to the recurrent tune of the Seasons had impressed its rhythm deeply upon the feelings and ideas of all but a fraction of the survivors of a five-or-six-thousand-years-long struggle for existence between the warring votaries of diverse ways of making a living. Though, down to the date of writing, the husbandman's annual series of operations had been repeated perhaps no more than some five thousand or some ten thousand times even in the South-West Asian regions in which the agriculture of the Old World had been invented, the *ἐναντὸς δαίμων*³ had been able, within this brief Time-span, to erect in the Human Psyche's subconscious abyss a primordial image of such spiritual potency that, through this dark glass, Christian faith had caught its vision of a Suffering and Dying God. In the post-Christian Industrial Western World of the twentieth century of the Christian Era this vision still appeared, in Christian eyes, to be the most penetrating and illuminating of any that Man was known ever to have been granted so far. Yet in the same century the husbandman's economic dance to the astronomical tune of the Seasons, out of which this sublime religious imagery had been conjured, was in the act of losing a dominion over Human Life which, in a post-Modern Western astronomer's, or even geologist's, Time-perspective, could now be seen in retrospect to have been short-lived, even at the longest estimate, when measured on the Time-scale of the life-span of the Human Race in the primitive pre-agricultural chapter of human history.

An organizing technique that had been able to liberate an Industrial Western Man from his physiological servitude to the cycle of Day-and-Night had found it relatively easy also to liberate him from his economic servitude to the Cycle of the Seasons by manning, with double or triple shifts of human ants, an industrial plant built to run, not only for twenty-four hours in the day, but for 365 days in the year; and the same spirit of Western enterprise had even succeeded, for the benefit of some Western consumers, in circumventing the dominion of the Seasons over Agriculture. In a Western World that had extended its domain out of the

¹ This annual refrain of human labour had, of course, been played in divers variations that were reflections of as many diversities of climate and occupation. In some variations the hot season, in others the cold season, and in others again the wet season was the closed season for economic activities; and the annual maxima of economic and military activity were in some cases crowded into one and the same season, while in other cases they were 'staggered' over different times of year. All these variations on Man's yearly round, however, had a common master theme in an astronomical Cycle of the Seasons to which, in one way or another, each of the human year-cycles conformed.

² See III. iii. 13-22.

³ See III. iii. 256-8.

Northern into the Southern Hemisphere and had invented cold storage and expeditious means of transport, any vegetable, fruit, or flower could be purchased at any season by any members of the public who had the money to make an 'effective demand' for it. A still more signal triumph of Man over Physical Nature was Western Man's discovery of ways and means for growing crops out of season without having to resort to the opposite hemisphere in order to perform this agricultural sleight of hand. He had learnt how to supplement the natural heat and light of the Sun by artificial lighting and heating; and this had also enabled him to push the cultivation of particularly valuable crops into colder latitudes than these could have braved in a state of nature without human nursing. Western Man's ingenuity had covered the irrigated lowlands of Southern California with a pall of 'smog' rising from a myriad frost-averting 'smudge-pots' interspersed among the ranks of many times their own number of orange trees, while in the Connecticut Valley it had covered the tobacco-plantations with acres of gauze to serve the same purpose of screening them from the blighting touch of winter. Perhaps the greatest of all such agricultural *tours de force* was the all-year-round production of southern fruits on the fringe of the Arctic Circle in an Iceland which had been transformed from a bleak wilderness into a market garden under glass through the tapping of an inexhaustible natural source of hot water welling up from a thousand geysers.

The Emancipation of a Psychological Business Cycle from a Physical Crop Cycle by the Industrial Revolution

The familiar annual round was possibly not the only astronomical cycle to which the Earth's flora was subject and to which Man was therefore indirectly enslaved in so far as he was dependent on Agriculture for winning his means of subsistence. The researches of latter-day Western meteorologists had brought to light indications of the currency of weather-cycles with a longer Time-span than the period of a single year. In an investigation of the eruptions of the Nomads out of 'the Desert' into 'the Sown' we have found some indirect evidence—in the shape of oscillations in the Balance of Power between the Nomads and their sedentary rivals in disputable borderlands—for the currency of a cycle with a span of as many as six hundred years, made up of two alternating bouts of humidity and aridity.¹ This inferential six-hundred-years-long climatic cycle was, however, at the time of writing, probably farther from being substantiated than were certain other apparent cycles of the same class, with wave-lengths running only into double or single figures reckoned in years, which had been described by meteorologists in periodical fluctuations of the yield, not of the natural grasses of the Steppe on which the Nomad pastured his flocks and herds, but of the crops artificially sown and harvested by the husbandman in his cultivated fields.² The approximate correspondence in dates of peaks and troughs,

¹ See III. iii. 395-454.

² See Huntington, E.: *Mainsprings of Civilisation* (New York 1945, Wiley), p. 460, fig. 57: 'Cycles in Wheat Prices for Three Centuries (after Beveridge) and in Weather for a Century in Europe (after Brunt and others).' According to Huntington, *ibid.*, 'the

as well as in wave-lengths, between certain series of these alleged crop-yield cycles and the contemporary series of 'Kitchin' cycles and 'Juglar' cycles in the economic history of an industrialized Western World had evoked the conjecture that the observed coincidence between these isorhythmic series of diverse orders might be, not a meaningless freak of Chance, but an indication that the crop series and the business series stood to one another in the relation of cause and effect.

If this conjecture had been confirmed by convincing evidence and by cogent reasoning, we should have had to add the Crop Cycle to the Year Cycle and the Day Cycle in compiling our list of instances of 'laws of Nature', current in Non-Human Nature, which had led or forced Mankind to dance to their tune; and no doubt the crop cycle too had exercised an at times tyrannical dominion over the lives of predominantly agricultural societies; but, among professional students of the business cycles current in a predominantly industrial Westernizing World, there was, at the time of writing, a preponderance of opinion, clear enough to be manifest even to the layman's eye, against accepting the suggestion that the currency of business cycles could be explained as an effect of a currency of crop cycles that was itself presumably an effect of periodic fluctuations in those meteorological conditions on which the weal or woe of cereal crops depended. In this judgement, W. C. Mitchell, T. S. Ashton,¹ R. G. Hawtrey,² J. A. Schumpeter,³ and G. Haberler concur. Haberler points out that there is a wide disagreement among different exponents of the theory that business cycles are to be traced to agricultural causes,⁴ and gives it as his own opinion that

"There can be no "agricultural theory" of the cycle in the sense of an alternative to, say, the monetary theory or the over-investment theory, any more than there can be an "invention theory" or an "earthquake theory". . . . It is conceivable that a good harvest may exercise now a stimulating and now a depressing influence according to the phase of the cycle and the portions of the Earth's surface and the World's population affected. Nor must it be readily assumed that a good wheat crop and a good cotton crop have the same kind of effects."⁵

Mitchell points out that

'Even the writers who regard changes in crop yields as the cause of business fluctuations . . . recognise that these fluctuations manifest themselves chiefly in commercial dealings, manufacturing activity, transportation, and financial operations.'⁶

At least two of the same authorities also agree in rejecting suggestions

most obvious approaches to agreement between Beveridge and Brunt fall near $3\frac{1}{2}$, 5, 8, $9\frac{1}{2}$, and 35 years.⁷

that business cycles may be effects of periodic fluctuations in some other non-human medium than the weather of the Earth whose fluctuations presumably account for those of crop yields. Ashton and Mitchell mention, only to discard,¹ the brilliant pioneer Stanley Jevons' audacious astrological conjecture that business cycles might be effects of fluctuations in the radioactivity of the Sun advertised by the appearance and disappearance of sun-spots; and Mitchell goes on to reject in principle all theories of physical causation, on the ground that no physical theory can be reconciled with secular changes in the wave-length of the 'Kitchin' Cycle which he believes that he has detected in the course of this cycle's currency up to the date of his own investigations during the third decade of the twentieth century.²

There was a wider consensus, in which A. C. Pigou concurred with the authorities already cited, in support of the view that the independence of the Late Modern and post-Modern Western business cycles of divers wave-lengths from the dominion of either the crop-yield cycle or any other periodic rhythm in Non-Human Nature had been the outcome of a progressive emancipation; and, on this view, the Industrial Revolution in the Western World had been revolutionary in two senses. It had not only inaugurated a novel kind of economic technique and organization; it had at the same time progressively liberated economic life itself—*pari passu* with the progressive establishment of the preponderance of Industry over Agriculture—from a bondage to the meteorological crop-yield cycle and to other alien forces, both non-human and human, to whose dominion Man's economic life had been subject in some measure under pre-industrial economic dispensations.³

A. C. Pigou, for example, in whose minoritarian view there had been a positive correlation between crop yields and pig-iron production in the United States⁴ and an approximate correlation between crop yields and the volume of industrial activity in general in the Western World as a whole,⁵ goes on to allow that, while 'crop changes are an important factor in determining industrial fluctuations',⁶ their influence in this field had been diminished by the relative decline in the importance of Agriculture by comparison with Industry in a Westernizing World.⁷

'Harvest variations as a factor determining, whether by direct or by indirect process, fluctuations in industrial activity, are substantially less important [in the third decade of the twentieth century of the Christian Era] than they used to be fifty or a hundred years ago.'⁸

And Pigou's final conclusion is that statistical correlations between crop-yield variations and business cycles

'do not warrant the opinion that crop variations are the sole, or even the

main, determinants of such periodicity as there is in industrial fluctuations.¹

Ashton draws the same picture of a shift, accompanying the march of a Late Modern Western Industrial Revolution, in the Balance of Power between the non-human external forces and the human internal forces exercising dominion over Western Man's economic life.

'There is little doubt, I think, that the fluctuations of harvests were a major cause of variations in economic activity in the eighteenth century. But nearly all economists now agree that the cyclical movements of the nineteenth century at least can be attributed to oscillation in investment (i.e. the creation of capital goods or goods not in a form available for direct consumption). It is the human factor rather than physical environment that is responsible.'²

In W. W. Rostow's opinion³ 'the domestic harvests played a significant part in British trade fluctuations' until A.D. 1850 beyond question, and probably till the eighteen-seventies.

The epiphany of the particular rhythmical economic fluctuations that had come to be known as business cycles had been contemporaneous with the rise and spread of the industrial type of economy. On the strength of evidence marshalled by W. R. Scott, 'it seems clear', in W. C. Mitchell's view,

'that the English crises of 1558-1720 were not business crises of the modern type, and that the intervals between these crises were not occupied by business cycles.'⁴

According to W. R. Scott himself, the vicissitudes in the economic history of England in the Early Modern Age of Western history were mostly caused by repercussions of forces operative on non-economic planes of life.

'It is when the forecast of the majority of traders is in error that a crisis results. The cause of the miscalculation may lie either mainly in the men who judge or in the events to be judged. . . . At later periods the importance of Man's judgment and calculation becomes marked in the period of speculative activity which precedes a crisis. But, prior to the development of banking, such intense activity is scarcely to be expected. . . . Analysing the crises up to 1720 . . . it will be seen that, owing to defective intelligence in the form of news or to bad government, the objective aspect tends to predominate.'⁵

The next chapter of the story may be told in Mitchell's, Ashton's, and Dupriez's words:

'Business cycles are much later in appearing than economic, or even strictly financial, crises. In England itself they seem not to have begun before the close of the eighteenth century. But, when they did appear, it was in the form of an extension—over all branches of industry—of difficulties not unlike those which had been suffered for more than a hundred

years by large capitalists, bankers and speculators in stocks. With this extension in scope came a shift in the relative importance of the causes. In the past the undermining of credit had usually been caused by war, by the making of peace, or by some violation of financial obligations on the part of Government. In the future it was to be caused more frequently by stresses engendered within the world of business itself. The reason for both changes lay in the gradual extension of the highly organised business enterprise from its earlier centres of foreign commerce, mining, finance, and banking over the wide field of manufacturing and domestic trade—an extension that accompanied the Industrial Revolution. . . . In proportion as the Industrial Revolution and its concomitant changes in the organisation of commerce and transportation spread to other countries, the latter began to develop the phenomena of business cycles already familiar in England.¹

'It is . . . clear that the booms and slumps occurred at the same time, or almost the same time, in all industrialised countries and in the less developed areas connected with these by trade.'²

'Dans le monde, par extensification géographique, comme dans la nation, par pénétration des sphères d'activité les moins industrielles, les spasmes de la conjoncture tendent à gagner du terrain et à se synchroniser.'³

In an oecumenical economy of Western origin in which Industry had established its ascendancy over Agriculture and in which this new-fangled predominantly industrial way of economic life had spread from its Western birthplace all over the face of the planet, the distinctive feature in the rhythm of economic activity was its autonomy.

'The waning, like the waxing, of prosperity . . . must be due, not to the influence of "disturbing causes" from outside, but to processes that run regularly within the world of business itself.'⁴

'The mysterious thing about [these fluctuations] is that they cannot be accounted for by such "external" causes as bad harvests due to weather conditions, diseases, general strikes, lock-outs, earthquakes, the sudden obstruction of international trade channels and the like. Severe decreases in the volume of production, real income, or level of employment as a result of crop failures, wars, earthquakes, and similar physical disturbances of the productive processes rarely affect the economic system as a whole, and certainly do not constitute depressions in the technical sense of business-cycle theory. By depressions in the technical sense we mean those long and conspicuous falls in the volume of production, real income, and employment which can only be explained by the operation of factors originating within the economic system itself, and in the first instance by an insufficiency of monetary demand and the absence of a sufficient margin between price and cost.'⁵

'For various reasons it seems desirable, in the explanation of the business cycle, to attach as little importance as possible to the influence of external disturbances. . . . The responses of the business system seem *prima facie* more important in shaping the business cycle than external shocks. Secondly, historical experience seems to demonstrate that the cyclical movement has a strong tendency to persist, even where there are

⁵ Haberler, op. cit., p. 265.

no outstanding extraneous influences at work which can plausibly be held responsible. This suggests that there is an inherent instability in our economic system, a tendency to move in one direction or the other.¹

If the fluctuations that made themselves felt in the flow of an industrialized Western economic life were neither astronomical rhythms in the motion of the stellar universe, such as the Day Cycle and the Year Cycle, nor meteorological rhythms in the temperature and circulation of the atmosphere and the water-jacket of the Earth, such as made themselves felt in the crop-yield cycle, we have to identify the medium in which these business cycles were inherent; and, here again, our question is answered for us by a consensus of the authorities whom we have just cited as witnesses to the industrial Western economic system's autonomy. The medium in which the recurrent cycles of expansion and contraction in an industrial society's business activity revolve is the psychic and spiritual medium of Human Nature itself.

'Every economic fact has a psychological aspect. The subject matter of economic science is human behaviour—chiefly conscious and deliberate behaviour. . . . The psychology of human behaviour is therefore a constituent part of the subject-matter of economics. When we assume that an entrepreneur will increase his output if demand rises or cost is reduced, or that workmen will respond to changes in money wages but not so readily to changes in real wages, or that consumers will buy more of a given commodity if the price falls and less if they think it will fall further, or that people will hoard money if the value of money rises—all these assumptions are assumptions about human behaviour which presuppose a certain state of mind on the part of the human agents.'²

'Money making for the individual, business prosperity for the nation, are artificial ends of endeavour imposed by pecuniary institutions. Beneath one lie the individual's impulsive activities—his maze of instinctive reactions partly systematised into conscious wants, definite knowledge, and purposeful efforts. Beneath the other lie the vague and conflicting ideals of social welfare that members of each generation refashion after their own images. In this dim inner world lie the ultimate motives and meanings of action, and from it emerge the wavering standards by which men judge what is for them worth while.'³

'The "cause," if we wish to use that term, of business cycles . . . is to be found in the habits and customs (institutions) of men which make up the money economy, with its money and credit, prices, private property, buying and selling, and so on, all loaded, so to speak, on the industrial process.'⁴

In this psychic medium a sense of uncertainty about the future is a potent motive force.

'Every economic decision is part of an economic plan which extends

¹ Haberler, op. cit., p. 10. This passage must, however, be read in the light of one on the preceding page, in which the author declares his opinion that purely endogenous, as well as purely exogenous, explanations of the Business Cycle are unconvincing.

into the more or less distant future. In principle, there is therefore always an element of uncertainty in every activity. There are, however, certain cases where the element of uncertainty is especially great and conspicuous, such as the case of investment of resources in long processes and durable plant and the provision of funds for these purposes. The longer the processes in which capital is to be sunk, and the more durable the instruments and equipment to be constructed, the greater the element of uncertainty and risk of loss.¹

"Uncertainty" . . . is . . . an all-pervading phase of every business undertaking. The tap root is uncertainty concerning what people will buy at what prices. . . . The fruits of uncertainty appear in the emotional aberrations of business judgments.² [Uncertainty about the future] gives hopeful or despondent moods a large share in shaping business decisions.³ . . . These emotional states are . . . in part the product of suggestions.⁴ . . . [Optimism] helps to produce conditions that both justify and intensify it.⁵

A significant part in building up the recorded rhythm of Industry is played by the mutual generation of errors of pessimism and errors of optimism.⁶

Perhaps the most impressive testimony to the truth that business cycles are products of psychic causes in a psychic medium is the avowal that Stanley Jevons has been constrained by his intellectual probity to make in the teeth of his own penchant in favour of seeing in business cycles the effects of non-human causes. While he cannot resist commenting

'It seems to be very probable that the moods of the commercial mind, while constituting the principal part of the phenomena, may be controlled by outward events, especially the condition of the harvests',

this comment is merely a wistful pendant to a frank admission that

'periodic collapses are really mental in their nature, depending upon variations of despondency, hopefulness, excitement, disappointment and panic.'⁷

'In recent years it has become fashionable to lay stress on the element of expectation.'⁸

'As economic events depend on Man's actions, one has to investigate what determines these actions. They always refer to a more or less distant future. Hence, one must study those expectations about the future which govern the actions.'⁹

'The record of movements in prices and interest rates goes to show that fluctuations in the real demand for labour come about predominantly through changes in expectations' [and not through changes in real income].¹⁰

'A change in expectations . . . can be taken . . . to define the beginning of the down-turn.'¹

These psychic disturbances that manifest themselves in the form of economic fluctuations may originate either in the subconscious abyss of the Psyche or on its conscious volitional surface, and from either of these two alternative possible psychic sources they may communicate themselves to the other psychic plane. For example,

'Deflation must not . . . be interpreted in the narrow sense of a deliberate act or policy on the part of the monetary authorities or commercial banks. . . . When the process has once got under way, a sort of automatic deflation or self-deflation of the economic system (in contradistinction to a deflation imposed on it by the monetary authorities) is just as much an effect as a cause.'²

Conversely, the dealings between consumer and producer begin at the consumer's end on the subconscious level but are raised to the conscious level in the producer's response to the consumer's challenge. In the first movement of this market dance

'the psychological categories important to the understanding of consumers' demand are habit, imitation, and suggestion—not reflective choice.'³

In the second movement

'production is guided by forecasts of what consumers will buy, supplemented by judgments concerning profitable methods of providing both consumers' goods and the endless variety of producers' goods which modern technique requires.'⁴

A progressive increase in the relative influence of conscious ideas, aims, plans, and decisions in the psychic causation of economic events seemed to have been one of the characteristic concomitants of the industrialization of Western economic life.

'The most significant items [among various factors determining the amplitude of industrial fluctuations] in a world of complex organisation . . . are the monetary and banking arrangements of the country, the policy of industrialists as regards spoiling the market, and the policy of work-people as regards rigidity of wage-rates.'⁵

In a money economy in which private enterprise enjoys an ascendancy over public enterprise, the individual's desire to make money is the most obvious of the conscious and deliberate psychic driving forces behind the production machine.⁶ 'Profit making is the central process among the congeries that constitute the activities of a business economy.'⁷ As Pigou puts it, 'in the Modern World industry is closely enfolded in a garment of

¹ Rostow, *op. cit.*, p. 56. *Ibid.*, p. 163, the same scholar draws attention to 'the role of expectations about the future, operating through the institutions of credit', in Bagehot's theory of economic cycles.

² Haberler, *op. cit.*, p. 323. The meaning which the author intends to convey in the last nine words here quoted seems to be 'is not only an effect but a cause'.

money.¹ In the particular form taken by a money economy in an industrialized Western World, one gauge of the increasing relative importance of conscious over subconscious psychic motive power was the submergence of business cycles that were fluctuations in the demand for, and supply of, consumers' goods by business cycles that were fluctuations in the volume of investment in producers' goods. This change in the character of business cycles had occurred in Great Britain round about the sixth decade of the nineteenth century, as we have already noticed in another context.² In a full-blown Industrial Age, 'industrial booms have nearly always been characterised by large and conspicuous investment in construction of some kind;³ and this is evidently bound to be a deliberate form of action.

The role of Reason in generating the business cycles in the economic life of an industrialized Western World was rated at its highest in a 'monetary' theory of which the most eminent and most wholehearted exponent at the time of writing was R. G. Hawtrey. According to this theory, the rhythm of 'slumps' and 'booms' was produced by a manipulation of monetary levers in the bankers' hands. 'The banks cannot allow optimism to prevail when gold is deficient, or pessimism when gold is redundant.'⁴ As one cause of business cycles among others, this 'monetary' cause was widely recognized as being, not merely authentic, but important. 'The crucial importance of the policy followed by the leading banks in determining whether a crisis shall become a panic' is underlined by W. C. Mitchell,⁵ while Haberler, after agreeing that the monetary theory must be near to the heart of the explanation of cyclical movements in an industrial Western economy,⁶ goes so far as to concede that a depression 'may be started by purely monetary forces without anything being wrong with the structure of production.'⁷ In its most uncompromisingly absolute form, however, the monetary theory of business cycles had proved unacceptable to a majority of the authorities down to the time of writing. Haberler, for instance, goes on to express the opinion that deflationary measures deliberately taken by governments or banks are not an all-sufficing explanation of all economic down-turns;⁸ Pigou finds that his 'personal judgment is adverse to the full claims of the monetary school';⁹ in Mitchell's opinion¹⁰ the state of the money market is not an infallible pointer to the general state of the body economic; and Rostow's study of the economic history of Great Britain during the years A.D. 1790-1914 has led him to the conclusion that 'in no cycle, over this period [in Great Britain], does inelasticity in the supply of money appear to have been the decisive factor in determining the moment of the down-turn.'¹¹ Yet, even if the ultimate verdict on this

ultra-rationalistic account of the psychology of business cycles were to be an adverse one on the whole, it seemed already certain that there would be a consensus in favour of looking for a psychological explanation of some kind, on one plane or other of psychic life, as opposed to a physical explanation of these fluctuations in the volume and profit of industrial economic activity in a latter-day Western World.

The Human Spirit's Educational Use of a Physical Generation Cycle as a Psychological Regulator of Social Change

The Crop-Yield Cycle that had been more or less authoritatively pronounced not to be the generator of the business cycles current in an industrialized world was a meteorological cycle of a longer wave-length than the astronomical Year Cycle or Day Cycle; but there was another physical cycle, with a longer wave-length again, which differed from both the Crop-Yield Cycle and the Annual Cycle of the Seasons, but resembled the Day-and-Night Cycle, in exerting its dominion over the Spirit of Man, not at two removes, through elements in his terrestrial environment out of which he made his living, but at one remove only, through a biological law which in this case was a law governing the physical self-perpetuation of the Human Race. This biological cycle was, of course, the Generation Cycle of birth, growth, life-work, procreation, and senescence leading up to a death which left the field clear for the time-expired individual human being's successors. The wave-length of this Generation Cycle varied between lower and upper limits of about a quarter and about a third of a century in response to differences in social customs and in the average expectation of life in different societies at divers times and places; and it was indisputable that the periodic breaks in the continuity of life arising from the recurrent replacement of representatives of one generation by representatives of another at each successive revolution of the Birth-and-Death Cycle produced a rhythm of their own in human affairs which made itself felt in the gait of human history. Have we here encountered a periodic rhythm which, though current in a biological medium, external to Man's psychic and spiritual nature, nevertheless held Man's psychic and spiritual nature under its sway and constrained the Soul to dance to Mortality's tune?

A sinister 'Dance of Death' which seems to mock Man's spiritual ideals and aspirations by cutting them off brutally with swiftly recurrent sweeps of an inhuman scythe had been apt to haunt men's imaginations in unsettled times, as, for example, at the transition from the medieval to the modern chapter of Western history on the evidence of contemporary German woodcuts,¹ and during a post-Minoan interregnum on the evidence of a passage in the *Iliad* that has been quoted already in this Study.² But Nature had a retort to both a Homeric pathos and a Teutonic morbidity which had been cast for her into biting verse by a poet-philosopher who had risen above all self-regarding emotional reactions to the spectacle of the procession of the generations of Man.

¹ e.g. the woodcut on fol. cclxiii of the Nuremberg Chronicle, cited on p. 178, n. 6, above.

² *Iliad*, Book VI, ll. 146-9, quoted in III. iii. 257.

Denique si vocem Rerum Natura repente
 mittat et hoc alicui nostrum sic increpet ipsa
 'quid tibi tanto operest, mortalis, quod nimis aegris
 luctibus indulges? quid mortem congemis ac fles? . . .'
 iure, ut opinor, agat, iure increpet inciletque.
 cedit enim rerum novitate extrusa vetustas
 semper, et ex aliis aliud reparare necessest . . .
 materies opus est ut crescant postera saecula,
 quae tamen omnia te vitâ perfuncta sequentur;
 nec minus ergo ante haec quam tu cecidere, cadentque.
 sic alid ex alio numquam desistet oriri,
 vitaeque mancipio nulli datur, omnibus usu.¹

The ordeal of Death, which was so tragic a catastrophe for each individual living creature, was evidently an indispensable contrivance for an ambitious Natura Creatrix if she was ever to break out of the blind alley of a deathless and therefore static unicellular organism into the infinite variety of multicellular organic life. Nature's endowment of her new creation with the gift of multiplicity-in-unity at the price of mortality insured her against being committed to more than a limited liability towards any single specimen or single species of her brood. It gave her a perpetually recurrent opportunity to liquidate her proven miscarriages and to follow up her more promising experiments. In fact, the epiphany of Death in the history of Life on Earth, so far from convicting Nature of ineptitude or impotence, was evidence that she had been successful in retaining an initiative that was a synonym for creativity itself; for the mortality of the creature was merely the obverse of Nature's unforfeited freedom to carry on her work of creation by varying at will the ratio between racial change and racial stability in the ever flowing series of her offspring.

If this 'concede: necessest'² were the whole story of Death's role in Nature's dealings with her creature Man, we might have ruefully to conclude that, in the working of the Generation Cycle, a rhythm in the flow of Physical Life had in truth imposed its dominion on the Spirit of Man. Before we accept this conclusion, however, we may recall that, in the life of those higher living creatures, culminating in Man, which procreate and die, there are two alternative methods of transmitting, from one generation to another, behaviour approved as valuable for future representatives of the species. There can be a transmission of a racial heritage of instincts and aptitudes through the physiological process of procreation; and there can be a transmission of a social heritage of habits and knowledge through the spiritual process of moral and intellectual education in the broad unprofessional meaning of this word.³ The second of these methods of transmission, which was the younger of the two, had been employed, as a second string to the older physiological device, by

¹ Lucretius, *De Rerum Naturâ*, Book III, ll. 931-4, 963-5, and 967-71.

² Lucretius, op. cit., Book III, l. 962.

³ 'Just as biological evolution was rendered both possible and inevitable when material organisation became self-reproducing, so conscious evolution was rendered both possible and inevitable when social organisation became self-reproducing' (Huxley, Julian: *Evolutionary Ethics*, the Romanes Lecture 1943, reprinted in Huxley, T. H. and J.: *Evolution and Ethics*, 1893-1943 (London 1947, Pilot Press), p. 122).

the non-human higher animals; but Man had been unique in inverting these proportions in the relative use that he had made of these two facilities; for Man had made singularly little use of a sexual animal's physiological facility,¹ while on the other hand he had developed a social animal's educational facility on an enormous scale without apparently having come within range of exhausting a capacity that thus bade fair to go on serving him *ad infinitum*.²

This capacity for transmitting a social heritage through a spiritual channel of the Human Spirit's own making was manifestly Man's distinctive trait.³ In the creation, preservation, improvement, and liquidation of all the pre-human multi-cellular terrestrial flora and fauna, Nature had used Death for her own purposes without asking her creatures' leave; but, in the ensuing human episode of the story, Man—impotent though he might be to win exemption from Nature's common law—had at any rate discovered a means of making an ineluctable Death serve Man's purposes as well as Nature's. A social animal which, in virtue of its sociality, had succeeded in scaling the precipitous ascent from Sub-Man's level to Man's had made use of Nature's Generation Cycle as an instrument for regulating the ratio between a social change and a social stability that, unlike the racial change and racial stability which had hitherto been Nature's prime concern, were elements in a spiritual world of Man's own. In thus making the Generation Cycle serve a social as well as a racial purpose, the Spirit of Man in the Age of the Primitive Societies had been doing what we have already watched it doing when, in the Age of the Civilizations, it seized the chance offered by an industrial revolution in Western Man's economic life in order to emancipate Man's economic activities from the dominion of astronomical and meteorological laws of Nature by bringing them under the rule of laws intrinsic to these human activities themselves. In these two achievements Man was progressively conjuring into existence an autonomous human province within Nature's realm; and this finding may help us to answer a question which we raised at the beginning of this chapter; for it suggests that, among the 'laws' whose currency we have detected in human history, laws of Non-Human Nature exercising a dominion over human affairs are likely to have been, not, of course, abrogated, but restricted in the scope of their incidence, by laws intrinsic to Human Nature in the psychic and spiritual meaning to which we are here confining our usage of the term. We can test this possibility by ascertaining whether it is in

¹ 'Indeed, there are grounds for suspecting that biological evolution has come to an end, so far as any sort of major advance is concerned' (Huxley, J., *ibid.*, p. 123).

² 'Real advance is now on quite another and more active front—the acquisition and transmission of wisdom and experience' (Sinnott, E. W.: 'The Biological Basis of Democracy', in *The Yale Review*, vol. xxxv, pp. 61–73 (New Haven, Conn. 1945, Yale University Press), quoted in Huxley, *op. cit.*, p. 184).

Man 'has invented a new mechanism of heredity—the transmission of Civilisation to his descendants by writing, teaching, artistic creation. . . . The essential feature of human evolution is . . . that it is a process dependent on Man's social life' (Waddington, C. H.: 'Human Ideals and Human Progress', in *The World Review*, August 1946, pp. 29–36, quoted in Huxley, *op. cit.*, p. 185).

³ 'With the advent of Man, major evolutionary change is, and will continue to be, mediated through a social, not through a biological, mechanism' (Huxley, J.: 'The Vindication of Darwinism', in Huxley, T. H. and J.: *Evolution and Ethics, 1893–1943* (London 1947, Pilot Press), p. 176).

harmony or in contradiction with historical facts. The business cycles in the history of an Industrialized Western Society, the war-and-peace cycles in the histories of the Western, Hellenic, and Sinic societies, and rhythms discernible in the growths and in the disintegrations of these and other civilizations are obvious test cases for us to explore.

In our consideration of business cycles in the present context, we have already come to the conclusion that, in the industrial phase of economic activity with which these cycles are associated, the laws of Nature whose currency can be detected are laws inherent in the life of the Human Psyche itself, and that, even if these psychic laws should prove not to be solely the laws of Reason which the pure monetary theory of business cycles was inclined to see in them exclusively, it was recognized by most authorities that some of them, at least, were laws governing the play of feelings welling up from the subconscious depths of the Psyche—particularly the expectant feelings of Hope and Fear. When we pass from the consideration of the forty-months-long 'Kitchin' business cycles and the nine-to-ten-years-long 'Juglar' business cycles to the twenty-three-to-twenty-five-years-long 'Rostow-Spiethoff' phases and the forty-to-sixty-years-long 'Kondratieff' business cycles¹ which had been keeping time with the contemporary war-and-peace cycles in latter-day Western history, and which might turn out to be reflections on the economic plane of these cycles on the political and military plane, it is evident that the alternating bouts of war and spells of peace with an average duration of 28·83 years, and the waves, with an average span of 57·66 years, between successive turning-points in the same direction, either from peace to war or from war to peace, out of which the three regular war-and-peace cycles in Modern and post-Modern Western history had been built up,² could be accounted for convincingly as products of the working of the Generation Cycle in the transmission of a social heritage.

It is manifest that the survivors of a generation that has been of military age during a bout of war will be shy, for the rest of their lives, of bringing a repetition of this tragic experience either upon themselves or upon their children, and that therefore the psychological resistance to any move towards the breaking of a peace that the living memory of a previous war has made so precious is likely to be prohibitively strong until a new generation that knows War only by hearsay has had time to grow up and to come into power. On the same showing, a bout of war, once precipitated, is likely to persist until the peace-bred generation that has light-heartedly run into war has been replaced, in its turn, by a war-worn generation whom these inexperienced war-mongers have sent to the shambles. Thus the alternating transitions from war to peace and from peace to war which succeed one another in the three Western regular war-and-peace cycles at intervals of an average span of 28·83 years could be explained as effects of the periodic breach that is made in the continuity of a social tradition every time that an experience has to be transmitted by the generation that has experienced it in its own life to a generation that has merely learnt of it at second hand. Yet this loss of compelling first-hand experience in the transition from one generation

¹ See pp. 230-2, above.

² See p. 287, above.

to its immediate successor, which might account for alternations of war and peace at intervals of about the average length of a generation, would not account for the distinction that an empirical survey of the historical evidence has led us to draw between 'general wars' and 'supplementary wars' and between the 'general peace' that is apt to follow a round of 'supplementary wars' and the 'breathing-space' that is apt to precede it; for the complete War-and-Peace Cycle constituted by the occurrence of a set of these four diverse phases in an unvarying regular order has a wave-length with a span, not just of approximately the length of a single generation cycle, but of approximately the aggregate length of four generation cycles, whether we measure this span from outbreak to outbreak of general wars or from the inauguration of one general peace to that of the next in the series. If we are to look for an explanation of the War-and-Peace Cycle in the working of some psychic law of Human Nature, and to find this psychic law in the periodic breaking of the continuity of a social heritage as this is transmitted by one generation to another, we shall not be able to account on these lines for a rhythm of the wave-length of the War-and-Peace Cycle unless we find that a cumulative psychic and social effect can be produced by a series of breaks between generations running beyond the singular into the plural.

We have only to remind ourselves of this consideration in order to recognize that a concatenation, not just of two generations, but of three, is apt to be the vehicle of social transformation in changes of Nationality, of Religion, and of Class. In all these three variations on the theme of social metamorphosis, it takes not only more than the experience-span of a single lifetime, but also more than a single breach of social continuity through the transmission of experience from one generation to another, to negotiate the passage from an inherited nationality, religion, or class to an adopted one.

In the field of changes of Nationality, this 'law' to the effect that it takes three generations for a family to achieve a social metamorphosis is aptly exemplified in an illustration of it that once came to the writer's personal notice. One day in the summer of A.D. 1932, at a public luncheon in the city of Troy, New York State, the writer, finding himself seated next to the local Director of Public Education, took the opportunity to ask his neighbour what, among all his manifold professional duties, was the job that he was finding the most interesting at the time. 'Organizing English lessons for grandparents' the Director promptly and unhesitatingly replied. 'And how, in an English-speaking country, does anybody manage to arrive at being a grandparent without having mastered the national language?' I thoughtlessly went on to inquire. 'Well, you see,' said the Director, 'Troy is the principal seat of the linen collar manufacturing industry in the United States, and, before the enactment of the United States Immigration Restriction Acts of 1921 and 1924, most of the labour-force here was recruited from foreign immigrants and their families. Now the immigrants who came from each of the principal emigrant-exporting countries had a way—which was natural enough in the new and strange surroundings in which they found themselves over here—of cleaving, as close as they could, to their own familiar past by

continuing to consort with other birds of the same feather. Immigrants of the same national origin were not only apt to work side by side in the same factories; they were apt to live next door to one another in the same blocks of tenements; and so, when the time came for them to retire, most of them knew little more English than they had known when they had first landed on American shores. They did not have to know any more up to this point in the American chapter of their life, because they commanded the services of home-bred interpreters. Their children had arrived in America young enough to go to the public school before entering the factory in their turn, and the combination of an American education with, let us say, an Italian infancy had made them thoroughly bilingual; they talked English in the factory, street, and store and Italian in their parents' homes almost without noticing that they were constantly switching back and forth from one language to the other; and their effortless and ungrudging bilingualism was highly convenient for their old parents. Indeed, it abetted their parents' inclination, after their retirement, to forget even the smattering of English that they had once picked up during their working life in the factory. However, this is not the end of the story; for in due course the retired immigrants' children married and had children of their own, and, for these representatives of a third generation, English was the language of the home as well as the school. Since their own parents had married after having been educated in the United States, one of them would be of non-Italian origin as often as not, and then English would be the *lingua franca* in which the father and mother would communicate with one another. So the American-born children of bilingual parents would not know their grandparents' Italian mother tongue, and, moreover, would have no use for it. Why should they put themselves out in order to learn a foreign lingo that would convict them of an un-American origin which they were eager to slough off and consign to oblivion? So the grandparents found that their grandchildren could not be induced to communicate with them in the only language in which the grandparents were able to talk with any ease, and they were thus confronted suddenly, in their old age, with the appalling prospect of being unable to establish any human contact with their own living descendants. For Italians and other non-English-speaking Continental Europeans with a strong sense of family solidarity, this prospect was intolerable. For the first time in their lives they now had an incentive for mastering the hitherto unattractive language of their adopted country; and last year they thought of applying to me for help. Of course I was eager to arrange special classes for them; and, though it is notorious that the enterprise of learning a foreign language becomes more difficult progressively as one grows older, I can assure you that these English lessons for grandparents have been one of the most successful and rewarding pieces of work that we have ever taken in hand in our department.'

This tale of Troy shows how a series of three generations can achieve, through the cumulative effect of two successive caesuras, a social metamorphosis which could never have been achieved by representatives of a single generation within the span of a single lifetime. The process by

which an Italian family transformed itself into an American family could not be analysed or described intelligibly in terms of any single life. An interaction between representatives of three successive generations was required in order to bring it about. The first generation of immigrants had to wait for the birth of grandchildren to move them seriously to embrace an alien nationality into which their grandchildren had been born. And, when we turn from changes of Nationality to consider changes of Religion and of Class, we find that, in these other two fields likewise, the family, not the individual, is the intelligible unit, and that, in the process of these changes likewise, the cumulative effect of two successive breaks between generations is needed in order to achieve the metamorphosis.

In a class-conscious Modern England which in A.D. 1952 was fast dissolving under the writer's eyes, it had usually taken three generations to make 'gentlefolk' out of a family of 'working-class' or even of 'lower-middle-class' antecedents; and in the field of Religion the standard wave-length of the process of conversion seems to have been the same. In the history of the eradication of Paganism in the Roman World, the intolerantly devout Christian-born Emperor Theodosius I followed the ex-pagan convert Constantine I on the Imperial Throne, not in the next generation, but in the next but one; and in the history of the eradication of Protestantism in an Early Modern Western France there was the same interval between the intolerantly devout Catholic-born Bourbon King Louis XIV and his ex-Calvinist Bourbon grandfather King Henry IV. In a post-Modern Western France at the turn of the nineteenth and twentieth centuries of the Christian Era it took the same number of generations to breed genuinely devout Catholics among the grandchildren of officially reconverted bourgeois agnostics or atheists who had re-embraced Catholicism on the cynically calculating consideration that this was a traditional form of virtual Paganism, native to the soil of France, which promised, if only the Church could re-enlist sufficient support, to serve as an effective institutional bulkhead against a rising tide of Socialism and other ideologies that threatened to do away with the economic inequality between the bourgeoisie and the working class.¹ In the Syriac World, again, under the Umayyad Caliphate, it took three generations to breed genuinely devout Muslims among Mawlās² whose ex-Christian or ex-Zoroastrian grandfathers had officially embraced Islam in order to make themselves eligible for being adopted as clients by influential members of a Primitive Muslim Arab ruling class. The duration of the Umayyad régime, which stood for the conquerors' ascendancy over the conquered, was determined by the three-generations-long period that had to elapse in order to bring the original converts' Muslim-born grandchildren on to the stage of History. The Umayyad agents of a libertarian Arab 'ascendancy' were supplanted by 'Abbasid exponents of a Muslim egalitarianism'³ when, in the name of Islamic principles and ideals, the genuinely devout Muslim grandchildren of cynical converts

¹ See the observations of a French authority in Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1929 (London 1930, Milford), p. 480, n. 1.

² See VI. vii. 142-4.

³ See VI. vii. 147-52.

tried conclusions with the Laodicean Muslim grandchildren of Laodicean Muslim Arab *conquistadores*.¹

If a concatenation of three generation cycles thus proves to be the regular psychic vehicle of social change in the three fields of Religion, Class, and Nationality, it would not be surprising to find a concatenation of four generations playing a similar part in the field of International Politics. In another context² we have already found that, in the field of encounters between civilizations, the Time-interval between the creation of an intelligentsia and its revolt against its makers has had an average length of about 137 years—i.e. about twenty years more than the combined Time-span of four generations of average length—in a set of three or four instances; and it is not difficult to see how a concatenation of four generations might also determine the wave-length of the War-and-Peace Cycle, if we may assume that the agony of a general war makes a deeper impression on the Psyche than is made on it by a comparatively anodyne round of supplementary wars. While it might require no more than a single inter-generational caesura to efface the impression of a general war sufficiently to give the next generation the nerve to embark on supplementary wars of limited scope, it might require two or three caesuras to make the grandchildren or great-grandchildren of the perpetrators and victims of a previous general war so insensitive to their forebears' crimes and sufferings as to have the heart to re-perform the tragedy on the grand scale. A psychological process thus working itself out across two or three inter-generational caesuras would extend, on an average, over a time-span of something between $87\frac{1}{2}$ and $116\frac{3}{4}$ years; and, in the Modern and post-Modern ages of Western history, these are, as we have seen,³ in fact the approximate maximum and minimum lengths of an interval between the outbreak of one general war and another which gives the measure of the wave-length of the War-and-Peace Cycle.⁴

The Subjection of Broken-down Civilizations to Laws of Subconscious Human Nature

This War-and-Peace Cycle, however, is neither the last nor the longest of the regularities and recurrences for which we have to seek an explanation; for each of these cycles running to a wave-length of anything from about 80 to about 120 years is merely one term in a series. In

¹ See VI. vii. 144. This is an exemplification of a 'law'—noticed in III. iii. 24-25—that, in Nomad empires *in partibus agrorum*, it usually takes three generations, reckoning from the date of the Nomad conquerors' eruption out of 'the Desert' on to 'the Sown', for the Nomad empire-builders to degenerate and for their 'human cattle' to recuperate.

² See IX. viii. 341, n. 1.

³ In this series of war-and-peace cycles the overture took 74 years (A.D. 1494-1568), the first regular cycle 104 years (A.D. 1568-1672), the second regular cycle 120 years (A.D. 1672-1792), the third regular cycle 122 years (A.D. 1792-1814). See Table I on p. 255, above.

⁴ In the light of this tentative psychological explanation of the standard wave-length of the War-and-Peace Cycle, we can perhaps now see why a reduplicated general war—in which one general war is followed, after a single breathing-space, by another general war instead of by a round of relatively innocuous supplementary wars—should be so portentous an enormity. If it normally requires two or three inter-generational caesuras to nerve a society to plunge into a general war again, the reduplication of a general war after a single caesura is manifestly something contrary to Human Nature, and the penalty for this breach of a psychic law is likely to be as signal as the breach itself.

Western history a series of war-and-peace cycles which had started in A.D. 1494 was in its 458th year and its fourth cycle in A.D. 1952; in Hellenic history a series that had started in 321 B.C. had run through 290 years and three cycles before it had been wound up in 31 B.C.; in Sinic history, 459 (or 550) years and five cycles had elapsed before a series that had started in 680 (or 771) B.C. had been wound up in 221 B.C.¹ Moreover, each of the first two series was, as we have seen,² only the second chapter of an older and longer story. In the history of each of these civilizations, and of others as well, we can trace these series of war-and-peace cycles in the relations between parochial sovereign states back into the afflicted civilization's growth-phase; we can watch the general wars that the civilization periodically inflicts on itself progressively taking a greater toll of the war-making society's energies until, sooner or later, one of these catastrophes precipitates a social breakdown; and from that epoch-making point we can follow the series of war-and-peace cycles working itself out to its conclusion through a Time of Troubles whose standard length we have found empirically to be of the order of approximately four centuries. A Time of Troubles, however, is no more than one phase of a far longer process of social disintegration; Times of Troubles are apt to be followed by universal states, and these, too, seem to run to a standard length of about four hundred years, which they sometimes exceed when they encroach upon the ensuing interregnum that is apt to intervene between the dissolution of a disintegrating civilization and the emergence of a successor affiliated to it. Thus the total Time-span taken by a series of war-and-peace cycles may vary between a minimum of 400 years and a maximum of 600, or perhaps even more, while the total Time-span taken by the disintegration of a civilization may vary between a minimum of 800 years and a maximum of not much less than 1,100. Will a psychological explanation of regularities in human affairs, which has served us up to this point, avail to account for the uniform recurrence of social processes, phase for phase in an identical sequence and measure for measure on an identical Time-scale, when these processes uniformly recurring in the histories of divers civilizations expand over periods which are many times longer, not only than the individual experience of a single life-time, but also than the cumulative experience of a concatenation of three or four generation cycles? Considering that, on the level of personal consciousness, the span of continuous human experience is confined within the limits of a single life-time, our answer to our question would have been bound to be in the negative if, in our eyes, the intellectual and volitional surface of the Psyche had been the whole of the Psyche, as the Hellenic discoverers of the Intellect were prone to assume that it was.

It is true that even the fathers of Hellenic philosophy were not so thoroughly blinded by the dazzling light of a newly discovered Reason as to be altogether without an inkling of an irrational psychic life brewing below this brightly illuminated surface of the Psyche in the dark depths of a subconscious abyss. Aristotle perceived and declared that 'the Intellect

¹ See Tables II and III, on pp. 268-9 and 273, above.

² See pp. 282-3, above.

by itself moves nothing';¹ and Plato had anticipated, and advanced beyond, this merely negative Aristotelian dictum in his myth of the Soul as a charioteer driving two mettlesome steeds of diverse temperaments.² All the same, it was left to the children of a Western Civilization, affiliated to the Hellenic, eventually to follow up these Hellenic surmises by tardily embarking, in a post-Modern Age of Western history, on the scientific exploration of a psychic underworld that had been familiar to Indic and Sinic contemporaries of the Hellenic discoverers of the Intellect, and that had been the source of every poet's and prophet's inspiration in all times and places.

In the Western World in the writer's generation a Western science of Psychology was still in its infancy; yet the pioneers had already carried their reconnaissances far enough to enable C. G. Jung to report that the subconscious abyss on whose surface each individual human personality's conscious intellect and will were afloat was not an undifferentiated chaos but was an articulated universe in which one layer of psychic activity could be discerned below another. The nearest layer to the surface appeared to be a Personal Subconscious deposited by a personality's individual experiences in the course of his or her own life up to date; the deepest layer to which the explorers had so far penetrated appeared to be a Racial Subconscious that was not peculiar to any individual but was common to all human beings, inasmuch as the Primordial Images latent there reflected the common experiences of Mankind, deposited during the infancy of the Human Race, if not at a stage before Man had yet become completely human. On this showing, it was perhaps not unreasonable to surmise that, in between the uppermost and the lowermost of the layers of the Subconscious that Western scientists had so far succeeded in bringing within their ken, there might be intermediate layers deposited neither by racial experience nor by personal experience, but by corporate experience of a supra-personal but infra-racial range. There might be layers of experience common to a family, common to a community, or common to a society; and, if, at the next level above the Primordial Images common to the whole Human Race, there should indeed prove to be images expressing the peculiar *êthos* of a particular society, the impress of these on the Psyche might account for the length of the periods which certain social processes seemed to require in order to work themselves out.³

For example, one such social image that was manifestly apt to imprint itself deeply on the subconscious psychic life of the children of a civilization in process of growth was the idol of the parochial sovereign state; and it can readily be imagined that, even after this idol had begun to exact from its devotees human sacrifices as grim as any that the Canaanites ever paid to Moloch or the Bengalis to Juggernaut, the victims of a demon which these victims themselves had conjured up might well need the poignant experience, not just of a single life-time and not just of one concatenation of three generation cycles, but of a span of not less than

¹ Aristotle: *Ethica Nicomachea*, Z 2, pp. 1139 A-B, quoted in III. iii. 231, n. 1, and on p. 395, below.

² Plato: *Phaedrus*, 246A-257B.

³ This consideration has been anticipated in IX. viii. 115-16.

four hundred years, in order to bring themselves to the point of plucking this baneful idolatry out of their hearts and casting it from them. It can also readily be imagined that they might need, not just four hundred years, but eight hundred years or a thousand, to dissociate themselves from the civilization whose breakdown and disintegration a Time of Troubles had made manifest, and to open their hearts to receive the impress of some other society of the same species or of the different species represented by the higher religions. For the image of a civilization presumably makes a still more potent appeal to the Subconscious Psyche than the image of any of the parochial states into which civilizations are apt to be articulated on the political plane unless and until they eventually enter into a universal state. From the same angle of mental vision we can likewise understand how a universal state, once established, should sometimes succeed, in its turn, in retaining its hold over its ex-subjects', or even over its actual destroyers', hearts for generations or perhaps even for centuries after it has lost its usefulness as well as its power and has become almost as grievously heavy an incubus as the antecedent parochial states that it had been created to liquidate.¹

'The relation between the external anxieties felt by the representatives of an adult generation—anxieties that are directly conditioned by the social position of the people who feel them—and the inward, automatically operating, anxieties of these people's children in the rising generation is unquestionably a phenomenon of importance over a wide field. . . . The stamp that is set by the procession of successive generations on both the psychic development of the individual and the course of historical change is something that we shall only begin to understand more adequately than we do at present when we have become more capable than we are to-day of taking our observations, and doing our historical thinking, in terms of long chains of generations.'²

If the social laws current in the histories of civilizations are indeed reflections of psychological laws governing some infra-personal layer of the Subconscious Psyche, this would also explain why these social laws should be, as we have found them to be, so much more clearly pronounced and more exactly regular in the disintegration-phase of a broken-down civilization's history than in its foregoing growth-phase.

Though the growth-phase, as well as the disintegration-phase, can be analysed into a series of bouts of Challenge-and-Response, we have found it impossible to discern any standard wave-length common to the successive bouts through which social growth takes place, whether we measure the intervals between successive presentations of challenges or the intervals between successive deliveries of effective responses, and we have also seen that in the growth-phase these successive challenges and successive responses are infinitely various. By contrast, we have found that the successive stages of the disintegration-phase are marked by repeated presentations of an identical challenge which continues to recur because the disintegrating society continues to fail to meet it;³ and we

¹ See VI. vii. 7-46.

² Elias, N.: *Über den Prozess der Zivilisation*, vol. ii: *Wandlungen der Gesellschaft: Entwurf zu einer Theorie der Zivilisation* (Basel 1939, Haus zum Falken), p. 451.

³ See V. v. 12-13.

have also found that, in all past cases of social disintegration that we have mustered in an empirical survey, the same successive stages all invariably occur in the same order, each stage taking approximately the same period of time in the history of one civilization as the corresponding stage in the history of another, so that the disintegration-phase as a whole presents the picture of a uniform process with a uniform total duration when we take a synoptic view of the divers examples of it provided by the histories of a dozen different broken-down civilizations. Indeed, as soon as a social breakdown has occurred and the process of social disintegration has set in, the tendency towards variety and differentiation that is characteristic of the growth-phase of a civilization is replaced by a nîsus towards uniformity and identity that shows its power and persistence by triumphing sooner or later over interference from outside, as well as over recalcitrance from within.

We have observed, for example,¹ how, when first a Syriac and then an Indic universal state was cut short by the impact of an intrusive Hellenic Civilization prematurely, before it had completed a universal state's standard life-span of some four hundred years' duration, the smitten and submerged society could not or would not pass away until, in spite of the disturbing influence of an alien body social, it had duly completed the regular course of a broken-down society's disintegration by eventually re-entering into the interrupted phase and abiding in a reintegrated universal state long enough to make up, in the aggregate, a psychological equivalent of the length of time normally occupied by this phase in the standard pattern of the disintegration-process.² Disintegration did not culminate in dissolution in either of these two historic cases until the prematurely shattered universal state had re-established its structure and resumed its course, even though in Indic history the interrupted universal state had to wait for more than 450 years before it could find its opportunity to achieve an avatar of the Mauryan Empire in the shape of the Guptan Empire, while in Syriac history it had to wait for no less than 950 years for the Achaemenian Empire to re-emerge in the shape of the Arab Caliphate. These belated but insistent resumptions of a regular

¹ In I. i. 73-77.

² This 'psychological equivalent' of a normal continuous Time-span of approximately four hundred years' length does not, of course, add up to precisely the same figure in the aggregate when it is provided in two instalments separated from one another chronologically by the intrusion of an alien civilization. We should expect it to take a longer aggregate tale of years to produce a psychological effect in two instalments than to produce it in a single instalment. In the Syriac case, for instance, in fact, that the effective durations of the interrupted universal state and the Arab Caliphate amount, in the aggregate, not just to 400 years, but to 522 (see Table I in vol. vi, p. 327, and also in vol. vii, p. 769, there). On the other hand the effective durations of the Mauryan and Guptan Empires amount to no more than 322 years (see *ibid.*); and, even if we were to equate the period of the *Pax Guptica* with the full length of time during which the Gupta Dynasty was officially regnant, we should barely arrive at an aggregate exceeding four hundred years for the two instalments here.

This at first sight surprisingly small aggregate duration of a *pax oecumenica* in Indic history is perhaps partly explained by the consideration that a psychological equivalent of it was also provided regionally, during the period of Hellenic intrusion, by the Bactrian Greek, Sakan, Kushan, and Andhran régimes to some extent. In this context we may observe that, during the corresponding Hellenic intrusion upon the Syriac World, the role of the Andhra Dynasty in Indic history was played in Syriac history by the Arsacidae and Sasanidae, and the role of the Bactrian Greek, Sakan, and Kushan princes by the Seleucidae.

course of disintegration, with a standard duration, that had been interrupted by the intrusion of an alien society, have their converse in the belated but ineluctable dissolution of the Egyptiac Society after it had set Fate at defiance by galvanizing its dead body social into a state of life-in-death which it managed to maintain for as long a period—some two thousand years in all—as the aggregate length of the preceding growth-phase and disintegration-phase.¹ The moral of this fruitless Egyptiac *tour de force* is

Nec prorsum vitam ducendo demimus hilum
tempore de mortis nec delibare valemus
quo minus esse diu possimus forte perempti.
proinde licet quot vis vivendo condere saecula:
mors aeterna tamen nilo minus illa manebit,
nec minus ille diu iam non erit, ex hodierno
lumine qui finem vitae fecit, et ille
mensibus atque annis qui multis occidit ante.²

Apparently a broken-down civilization that has travelled so far along the path of disintegration as to have entered into a universal state has no more power to achieve immortality by prolonging this phase of life-in-death in *saecula saeculorum* than it has to anticipate the inevitable hour by going into dissolution before it has served the full term which every disintegrating civilization is doomed to serve in this phase of the disintegration process.

This striking contrast between the regularity and uniformity of the phenomena of social disintegration and the irregularity and diversity of the phenomena of social growth has been noted frequently in this Study up to this point as a matter of manifest historical fact, without any attempt so far to account for it. In the present Part, which is concerned with the relation between Law and Freedom in human affairs, it is incumbent on us to grapple with this problem; and a key to its solution may be found in the difference between the respective natures of the conscious personality on the surface of the Psyche and the subconscious levels of psychic life underlying it.

The distinctive gift of Consciousness is a freedom to make choices—between alternative courses of action for the Will, and between alternative ideas and beliefs for the Intellect; and, although this path of freedom has an inner law and order of its own which is manifest from within to the thinking, planning, and acting personality itself, the same path looks capriciously disorderly when it is surveyed by a spectator from outside. In the sight of an alien observer, 'the wind bloweth where it listeth';³ and, considering that a relative freedom is one of the characteristics of the growth-phase in the history of a civilization, it is, after all, only to be expected that, in so far as human beings are free in these circumstances to determine their own future for themselves, the course which they follow should be in truth, as it appears to be, a wayward one in the sense of being recalcitrant to the rule of 'laws of Nature'.

The reign of Freedom, which thus keeps 'laws of Nature' at bay, is,

¹ See I. i. 136-9.

² Lucretius: *De Rerum Naturâ*, Book III, ll. 1087-94.

³ John iii. 8.

however, precarious inasmuch as it depends upon the fulfilment of two conditions, both of which are evidently exacting and arduous. The first condition is that the conscious personality must keep the subconscious underworld of the Psyche under the Will's and the Reason's control; the second condition is that it must also contrive to 'dwell together in unity'¹ with the other conscious personalities with which it has to dwell on some terms or other in the mortal life of a *Homo Sapiens* who was a social animal before he was a human being, and was a sexual organism before he was a social animal. These two necessary conditions for the exercise of freedom are actually inseparable from one another; for, if it is true that, 'when knaves fall out, honest men come by their own',² it is no less true that, when persons fall out, the Subconscious Psyche escapes from the unwelcome control of each and all of them.

Plato's comparison of the demonic forces of the Subconscious to mettlesome steeds, and of the controlling Personality to a charioteer, is perhaps too flattering to the Soul. The Zen School of Mahayanian Buddhism may be nearer to the mark in likening the Subconscious to an ox and the Conscious Personality to a boy who has to win and keep control over the powerful and recalcitrant beast by cultivating the Orphic arts of tact and charm.³ Mithraism, picturing the beast, not as an ox, but as a bull, draws the conclusion that he cannot be domesticated and must therefore be butchered if the Personality is to assert its freedom effectively, and this militant attitude towards the Subconscious Psyche, which is the antithesis of a Far Eastern *modus vivendi*, was bequeathed by Mithraism to Western Christendom.

'From the beginning the Chinese seem to have favoured a dynamic rather than a moral conception of the Universe. The specialisation of the Intellect never assumed so great an ascendancy as to pit Reasoning Man against Unreasoning Nature. Whereas the heroic attitude of the West tends to picture Man in constant warfare with the destructive powers of Nature, Chinese common sense prefers to convince the bull that a parallel movement is better in every way than mere opposition. In the West the dragon symbolises the power of evil or the force of regression, for the Western mind is rooted in the idea that Man's original nature is evil. In the East the dragon dwells on the highest mountains and is identified with clouds and flowing water, because the Eastern mind sees spiritual events as the interplay of natural elements. Hence the dragon, as symbol of the inexhaustible potential of natural energy, represents beneficent spiritual power.⁴ So long as it is conceived along Miltonesque lines as representing

³ See Suzuki, D. T.: *The Ten Oxherding Pictures* (Kyoto 1948, Sekai Seiten Kanko Kyokai), quoted in VII. vii. 506.

⁴ Was Goethe inspired by some picture, or pictorial image, of Chinese provenance when he wrote

Kennst du den Berg und seinen Wolkensteg?
Das Maultier sucht in Nebel seinen Weg,
In Höhlen wohnt der Drachen alte Brut,
Es stürzt der Fels und über ihn die Flut:
Kennst du ihn wohl?

Dahin! Dahin!

Geht unser Weg; O Vater, lass uns ziehn!

Was it merely a chronological coincidence that an eighteenth-century Western philo-

the power of Hell, it has to be combated as evil. Yet, if we only could regard the dragon as a superior power, it would possibly reveal to us the daemonic aspect of God.¹

A more prosaic variation on the same mythical theme is the picture of a man who has to drive to market neither Saint George's dragon nor Mithra's bull nor a Chinese sage's ox, but some sullenly obstinate animal, such as a camel, a mule, or a goat, or some perversely insubordinate animal, such as a pig. It is relatively easy for the man to survey the country, choose his market, and find the most direct road leading to this goal; but 'the Intellect by itself moves nothing';² the man would be going to market on a bootless errand if he failed to bring the pig along with him; and in any case his freedom does not run to the length of allowing him this choice; for he is tied to the pig by an undetachable umbilical cord, and he must therefore either contrive to take the pig with him or resign himself to never reaching his own objective. His choice lies, not between bringing the pig to market and leaving it behind in its sty, but merely between alternative methods of trying to get the pig to travel his way. If he is Mithraic-minded, he will cut the pig's throat, sling the carcass over his shoulder, and stagger forward with his back bowed down under the weight of Pilgrim's burden. If he is Prussian-minded, he will try to coerce the creature with a drill-sergeant's rod;³ if he is Platonic-minded, he will try to drive it with a charioteer's firm but sympathetic handling of the reins; if he is Zen-minded, he will try to charm it, with Orphic strains, to travel of its own accord towards the magic flute-player's appointed goal for this pair of incongruous yet inseparable Siamese twins. The man has a wide choice of tactics for bringing the beast along with him; the one thing that he cannot do is to travel unencumbered by the creature's awkward company. His predicament has been portrayed, with the insight of genius, by Pascal.

'Il ne faut pas se méconnaître: nous sommes automate autant qu'esprit; et de là vient que l'instrument par lequel la persuasion se fait n'est pas la seule démonstration. . . . Les preuves ne convainquent que l'esprit; la coutume fait nos preuves les plus fortes et les plus crues; elle incline l'automate, qui entraîne l'esprit sans qu'il y pense. . . . Quand on ne croit que par la force de la conviction, et que l'automate est incliné à croire le contraire, ce n'est pas assez. Il faut donc faire croire nos deux pièces: l'esprit, par les raisons, qu'il suffit d'avoir vues une fois en sa vie; et l'automate, par la coutume, et en ne lui permettant pas de s'incliner au contraire. *Inclina cor meum, Deus.*'⁴

It is evident that, even if this life-long implication with a subconscious fellow-traveller were the only impediment to the progress of a personality

sophy discarded a traditional Christian belief in Original Sin in favour of a revolutionary faith in the perfectibility of Human Nature on the morrow of the initiation of a Late Modern Western Republic of Letters into the Sinic Weltanschauung by Jesuit Sino-logues at the turn of the seventeenth and eighteenth centuries? Or did these consecutive events in Western history stand to one another in a relation of cause and effect?—A.J.T.

along the path of freedom, the task of perpetually vindicating this freedom by keeping this obligatory subconscious companion in step with itself would be a heavy tax on a personality's spiritual resources; but, in this ceaseless contest between man and pig, the man also labours under one grievous handicap from which the pig is exempt and of which the pig also knows how to take full advantage. While there is only one pig, there is a host of drivers tethered to his sly tail; and, if the drivers fall out with one another and, in falling out, neutralize one another's efforts to control the pig, then the pig has a chance of capturing the initiative from each and all of them, and of taking his revenge by leading each and all of them by the nose. The worst of it—from the drivers' standpoint—is that, notwithstanding their common interest in keeping the pig in order, it is superhumanly difficult for the drivers to achieve and maintain the mutual harmony without which each of them will be impotent to carry out their identical task; for, though Man is a social animal, and indeed is this *ex officio originis*, his attempts to achieve harmony between will and will and between mind and mind have been as singularly unsuccessful as his attempts to discipline or civilize his subconscious mate, by contrast with Man's extraordinary success in discovering the secrets, and tapping the energies, of Physical Nature. Moreover, in his social life Man has been least unsuccessful within the narrow range of his personal relations; the social problem that has signally defeated him is, as we have seen,¹ the problem of harmonizing wills and minds over a wider range on which a majority of the relations are necessarily impersonal. On this wider range, on which Man is bound to lead his social life if he is not to renounce his ambition to master Physical Nature, Man has so far not hit upon any more effective or less perilous an expedient than to mechanize the relations between wills and intellects by subjecting them to 'social drill' through the enlistment of a faculty of mimesis which is the antithesis of rational choice and is, indeed, native, not to the conscious surface of the Psyche, but to the underlying subconscious abyss. If the quarrelsome drivers of the pig can think of no better way of keeping the peace among themselves than to take a leaf out of a porcine copybook, it is no wonder that their best-laid plans for securing social harmony with one another should 'gang aft a-gley';² and it is, in fact, notorious that the institutional machinery through which Man has endeavoured to organize his life on a supra-personal range has been Man's most tragic and most deadly failure. In the life which Man has made for himself on Earth, his institutions, in contrast to his personal relations, are the veritable slums, and the taint of moral obliquity is still more distressing in the least ignoble of these social tenements of the Human Spirit—for instance, in the churches and the academies—than in such unquestionably malignant institutions as Slavery and War.

Thus the gift of Consciousness, whose mission is to liberate the Human Spirit from 'laws of Nature' ruling over the subconscious abyss of the Psyche, is apt to defeat itself by misusing, as a weapon in a fratricidal conflict between one personality and another, the freedom that is its *raison d'être*; and the structure and working of the Human Psyche

¹ See IV. iv. 133-584.

² Burns, Robert: *To a Mouse*.

account for this tragic aberration without any need for recourse to Bossuet's¹ impious hypothesis of special interventions on the part of an omnipotent yet nevertheless jealous God to make sure that human wills shall reduce one another to impotence by cancelling one another out.

'History is so made that the end result always arises out of the conflict of many individual wills in which every will is itself the product of a host of special conditions of life. Consequently there exist innumerable intersecting forces, an infinite group of parallelograms of forces which give rise to one resultant product—the historical event. This again may itself be viewed as the product of a force acting as a Whole without consciousness or volition; for what every individual wills separately is frustrated by what everyone else wills, and the general upshot is something which no one willed.² And so the course of History has run along like a natural process; it also is subject essentially to the same laws of motion.'³

This acute observation by one of the twin founding fathers of a Communist Church had been elaborated by a later Western student of social laws of Human Nature.

'Historical change, taken as a whole, is not the working out of any "rational" plan; yet at the same time it is also not just a chaotic appearance and disappearance of forms subject to no kind of order. How is this possible? How can it happen, at all, in a human world, that formations should come into being that have not been intended by any single human being, yet which, nevertheless, are worlds away from those shapes without stability, development, or structure that are assumed by the clouds. . . ?

'The answer to these questions is a simple one. The plans and the transactions, the feelings and the thoughts, of individual human beings are perpetually subject to interference, friendly or hostile, from one another. This interweaving of individual human plans and transactions, which is [one of the] fundamental [facts of human life], . . . and which, moreover, goes on continuously from generation to generation, is something that has not, itself, ever been planned. It cannot be understood by reference to the plans and aims of individual human beings, or on the

¹ See the passage quoted on pp. 381-2, below.

² In the same passage, Engels credits his poignantly true story of the mutual frustration of human wills with an unconvincingly 'happy ending':

'From the fact that the wills of individuals—who desire what the constitution of their body, as well as external circumstances, in the last instance economic (either personal or social), determine them to desire—do not get what they wish, but are sunk into an average or common result, from all that one has no right to conclude that they equal zero. On the contrary, every will contributes to the result and is in so far forth included within it.'

This 'happy ending' to Engels' grim proposition rings hollow; for wills that 'do not get what they wish' do equal zero in terms of the achievement of a conscious personality's deliberate purpose; and Engels' statement can mean no more than that each frustrated will would have made a contribution to a resolution of forces if the forces here in play had been mechanical (as they are not) instead of being volitional (as they are).

What moved Engels to adulterate the pure milk of his word by throwing in a grain of comfort that has the triple demerit of being untrue, unconsoling, and incongruous? The belief that human history is subject to laws of Nature is one of the cardinal doctrines of the Communist faith. What has induced this secular theologian thus to blunt his theology's cutting edge? It looks as if Engels were here inadvertently contaminating the Communist conception that laws of Nature come into operation in human affairs through the mutual frustration of human wills with a reminiscence of the Christian conception that human wills can save themselves from frustration in so far, and only in so far, as they voluntarily conform themselves to the will of God.—A.J.T.

³ Engels, F.: Letter of the 21st September, 1890, to J. Bloch, reprinted in Hook, S.: *Towards the Understanding of Karl Marx* (New York 1933, Day), pp. 334-5.

analogy of the pattern that these display. . . .¹ [On the other hand,] it has the power to produce changes and formations which no single human being has planned or created. This interdependence of human beings, one with another, gives rise to an order of a highly special character—and this order is more compelling and more powerful than the will and the reason of the individual human beings who bring it into existence. This order, consisting in a network of interwoven relations, is the power that governs the course of historical change; this is the principle that lies at the root of the process of Civilisation.

"This order is neither "rational"—if by "rational" is meant something that has come into being, like a machine, as a result of purposive thinking done by individual human beings—and it is not "irrational" either—if by "irrational" is meant something that has come into being in a way that is beyond our comprehension. . . . The law governing the phenomena of social interweaving is a distinctive system which is identical neither with the law of the "Spirit" (*des "Geistes"*), in the sense of individual thinking and planning, nor with the law of what we call "Nature", in spite of the fact that all these divers dimensions of Reality are indissolubly bound up with one another in action (*funktionell*)."²

Engels' 'force acting as a whole without consciousness or volition', which comes into play when wills illuminated by Consciousness frustrate one another, and which is governed by a social law that is neither the law of the Spirit nor the law of Physical Nature, is none other than the subconscious tide in the Psyche, which no sooner escapes from the control of some will and mind that have been carrying it whither it would not³ than it relapses into an unchallenged obedience to a law which is the antithesis of Freedom and which is morally facile just because it dispenses its subject from the free spirit's agonizing responsibility for making choices.⁴ The character of these laws of the Subconscious Psyche was being brought to light by post-Modern Western psychologists in the writer's day, and two features of it were already clearly discernible: by comparison with the volatility of conscious thought and volition, the gait of subconscious imaginative and emotional life was evidently as slow as it was regular. Even when a conscious personality was more or less in control of its subconscious underworld, its freedom of manoeuvre would be limited by the necessity of humouring the *éthos* of an inseparable subconscious fellow-traveller who could not be forced, either by coaxing or by coercion or by the *ultima ratio* of resort to a Mithraic butcher's knife, to exceed his own dead-slow maximum pace or his own infinitesimal maximum capacity for swerving from an irrationally sacrosanct rut of routine. *A fortiori*, when the subconscious brute was exempt from the imposition of conscious control thanks to an incapacitating fratricidal strife among the host of conscious personalities between whom

¹ This passage will be found, in the original, on p. 476.—A.J.T.

² Elias, N.: *Über den Prozess der Zivilisation*, vol. ii: *Wandlungen der Gesellschaft: Entwurf zu einer Theorie der Zivilisation* (Basel 1939, Haus zum Falken), pp. 313-15.

³ John xxi. 18.

⁴ The penalty that conflicting wills bring upon themselves by frustrating one another is thus not merely their own dethronement; it is the re-enthronement of the Subconscious Psyche; and this disconcerting positive consequence of mutual frustration is not faced by Engels in the perfunctory consolations of Philosophy that he offers in the passage quoted on p. 335, n. 2, above.

this control had to be shared, it was only natural that Caliban should celebrate his release from an irksome servitude by moving at a slower and more regular gait than ever.

On this showing, a process of social disintegration running through a regular series of phases in an unvarying order, and moving at a set pace over periods of approximately identical length in all cases, can be seen to reflect the *ethos* of a Subconscious Human Nature so faithfully that the detection and recognition of this process can hardly be dismissed as the baseless conceit of a phantasy arbitrarily imposing a subjective standard pattern of its own on the histories of broken-down civilizations in their disintegration-phase. A student of the *ci-devant* intelligence that had been petrified into instinct in the psychic life of the bees had ascertained that, in this apian psychic universe, instinctive acts that fall into sequences of chapters have to be performed integrally if they are to be performed at all. No chapter can be omitted because it has become superfluous, or be repeated because it has not been performed effectively at the first essay, or be transposed from its established place in the series because a transposition would make for increased efficiency;¹ for the law that rules over the instinctive life of the bees is not the flexible law of rational experiment and reflection; it is the adamant 'law of the Medes and Persians which altereth not',² however convincingly and insistently a change may be demanded by an empirical common sense.

These findings of an apian social science can be translated into the human language of Plato's simile of the charioteer and our own simile of the cart and the wheel. So long as the driver of a vehicle is seated on the box with the reins in his hands, no spectator who does not happen to be in the driver's confidence can foretell the equipage's destination, route, or speed; but, if a brawl between two rival coachmen scrambling for possession of the reins unintendedly gives the horses their head, an observer has only to acquaint himself with the horse-power of the draft animals and the relief of the *terrain* in order to be able to calculate exactly how many seconds will elapse and how many revolutions of the wheels will occur before the runaway horses land themselves and the carriage and its quarrelling occupants in the ditch. 'Fertur equis auriga neque audit currus habenas.'³ For the purposes of this calculation it makes no difference whether the accident has overtaken the party at the outset of the journey or within sight of their destination, nor what route the map records nor what mileage the taximeter registers nor what passage of time the stopwatch reads down to the moment when the driver lost control and the catastrophe happened. All these antecedent data are irrelevant because, whatever they may be—and they may, of course, be widely diverse in different cases—the carriage and pair, when once left to their own devices, will take, in every case, an identical course and an identical time to go to perdition.

(III) ARE LAWS OF NATURE CURRENT IN HISTORY INEXORABLE OR CONTROLLABLE?

If our foregoing survey has convinced us that human affairs are amenable to laws of Nature as a matter of fact, and that the currency of these laws in this realm is also explicable, at least to some extent, we may now go on to inquire whether laws of Nature current in human history are inexorable or controllable. If we here abide by our previous procedure of considering laws of Non-Human Nature first before we bring laws of Human Nature into our picture, we shall find that, as far as laws of Non-Human Nature are concerned, we have virtually answered our present question in the preceding chapter.

The short answer is that, though Man is powerless either to modify the terms of any law of Non-Human Nature or to suspend its operation, he can affect the incidence of these immutable and inexorable physical laws on human affairs by steering his own course on lines on which the laws of Non-Human Nature will be ministering to human purposes instead of frustrating them. It is true, for example, that no human being, by taking thought, can add one cubit unto his stature;¹ but it is also true that a biped on whose bodily height a 'ceiling' of little more than four cubits above ground level had been imposed by Physical Nature so long as the creature was standing with its feet on *terra firma*, had succeeded in raising this 'ceiling' to an altitude of several miles above sea-level for human beings whose intelligence and manual skill had enabled them to take to the air by making other laws of Non-Human Nature work for Man through the device of the internal combustion engine. We have already watched Man eluding the incidence of the Day-and-Night Cycle by equipping his ships and his industrial plants with large enough crews to keep the ship travelling, or the factory wheels turning, for twenty-four hours in the day by the device of dividing the crews into 'shifts' constantly relieving one another. We have likewise watched Man eluding the incidence of the Year Cycle by growing crops in the antipodes, inventing cold storage and rapid means of transport in bulk, and keeping the cold and the heat at bay by divers methods of artificial heating and cooling.

Western Man's success in modifying the incidence of laws of Non-Human Nature upon human activities had been registered in reductions in rates of insurance premium. Improvements in charts, followed up by the installation of wireless and radar on board ship, had diminished the risk of shipwreck through running aground or through crossing the path of a hurricane; the installation of lightning-conductors had diminished the risk of lightning damage to ships, ricks, and buildings; the smudge-pots of Southern California and the gauze screens of the Connecticut Valley had diminished the risk of frost damage to crops cultivated in a climate that would have been just too inclement to harbour them without Man's deft intervention in Flora's favour; the devices of inoculation, spraying, and baptism with pest-killers had diminished the danger of pest-damage to crops, trees, and flocks; while, in the life of the human husbandmen of this domesticated Flora, and shepherds of this

¹ Matt. vi. 27; Luke xii. 25.

domesticated Fauna, the incidence of disease had been diminished, and the expectation of life had been lengthened, by advances in preventive medicine which had proved most effective when they had taken the positive form of improvements in the physical and spiritual conditions of human life.

When we pass into the realm of laws of Human Nature, we find the same tale being told by reductions in rates of insurance premium here likewise. The risk of accidents on the road and in the factory had been reduced through a moral education in a sense of responsibility still more effectively than through the imposition of pains and penalties or through the installation of physical safety-devices. The risk of burglaries—which was more conspicuously refractory than the risk of accidents was to reduction either through precautions or through punishments—had been found to vary in inverse ratio with the general average level of moral probity, and this, in its turn, was apt to vary in some relation with the minimum level of material well-being in societies in which there was no more than an infinitesimally rare leaven of saints capable of rising wholly superior to their material circumstances.

On the economic plane it had been found that the volume of production per man-hour could be increased by the stimulation of the will to work more notably than by improvements in the skill of the workman or in the efficiency of his tools; and religious, ideological, and political motives for working with a will had sometimes proved more potent than economic incentives.

When we come to consider, for our purpose in this chapter, those alternating increases and decreases in Western economic activity that had come to be known as business cycles, we find the professional students of them drawing a distinction between the 'controllable' and the 'uncontrollable' factors,¹ and one school—namely, the exponents of the 'pure monetary theory'—going so far as to maintain that these fluctuations were due to a control deliberately exercised by the bankers over the activities of the traders and the manufacturers. A majority, however, of the experts in the writer's day evidently held that these deliberate acts, based on rationally calculated considerations of individual self-interest, on the part of persons occupying key positions of power in the economic system, counted for less in the generation of a rhythm of alternating booms and slumps than the uncontrolled play of imagination and feeling welling up from the subconscious lower levels of the Psyche.

'In rejecting some and accepting other schemes, the men of money are taking an important, though not a conspicuous, part in determining how labor shall be employed, what products shall be made, and what localities built up. Not all lenders, however, are able to make intelligent decisions. The great mass of small investors, and not a few of the large, lack the experience or ability or time to discriminate wisely between profitable and unprofitable schemes. . . . Investors who lack independent judgment are peculiarly subject to the influence of feeling in the matters where feeling is a dangerous guide. The alternating waves of confidence and timidity

¹ See, for example, Haberler, G.: *Prosperity and Depression* (3rd ed., Geneva 1941, League of Nations), p. 7.

which sweep over the market for securities are among the most characteristic phenomena of business cycles. Even those who are relied upon for advice are not wholly immune from the emotional contagion. Thus the guidance of economic activity by the investing class is only in part an intelligent review of plans by competent experts.¹

This picture of economic activity fluctuating under the ascendancy of almost blindly irrational subconscious psychic forces came into sharper focus when Economic Man was considered, not as a producer, but as a consumer.

'One reason why spending money is a backward art in comparison with making money [is that] the family continues to be the dominant unit of organisation for spending money, whereas for making money the family has been superseded largely by a more highly organised unit. The Housewife, who does a large fraction of the World's shopping, is not selected for her efficiency as a manager, is not dismissed for inefficiency, and has small chance of extending her sway over other households if she proves capable. . . . It is not surprising that what the World has learned in the art of consumption has been due less to the initiative of consumers than to the initiative of producers striving to win a market for their wares.'²

These considerations suggested that the fluctuations in the volume of business activity in an Industrial Western World might continue to escape control so long as the units of consumption continued to be households, and the units of production freely competing individuals, firms, trade-unions, and states whose conflicting wills largely cancelled one another out and, to that wide extent, left the economic arena open for the play of subconscious psychic forces. At the same time there seemed no reason why the Hebrew Patriarch Joseph's legendary success, as economic intendant of an Egyptiac World during the last days of a Hyksos régime, in making provision during years of abundance against coming years of scarcity should not be emulated on a 'global' scale in a latter-day Western World that had become coextensive with the entire habitable and traversable surface of the planet. By maintaining reserves of non-perishable commodities, by rendering perishable commodities non-perishable through deep-freezing, and by constantly rationing supplies of consumers' and producers' goods and purchasing power on a comprehensive long-term plan, there seemed no reason why some historic American or Russian Joseph should not one day bring the sum total of Mankind's economic life under a central control which, whether benevolent or malevolent, would assuredly outrange in its effectiveness the wildest flights of either Mosaic or Marxian fancy.

When we pass from business cycles with a forty-months-long or a nine-to-ten-years-long wave-length to a Generation Cycle with a wave-length of something between a quarter and a third of a century, we can see that, in a twentieth-century Westernizing World, the wastage to which any cultural heritage was perhaps bound to be subject in some measure in the course of its transmission from one generation to another was being reduced on the physical plane by typing, printing, photostating, and

¹ Mitchell, W. C.: *Business Cycles, the Problem and its Setting* (New York 1927 (reprinted 1930), National Bureau of Economic Research, Inc.), p. 163. ² *Ibid.*, pp. 165-6.

other techniques for producing permanent visual records, and on the spiritual plane by improvements in education—in the broader meaning of the word—that were making a larger proportion of the total social heritage more fully available to a higher percentage of the total population in each successive rising generation. This diminution of the entries on the debit side of the Generation Cycle's account was, however, manifestly less difficult to achieve with the physical and spiritual means so far acquired by Man than it would be for Man deliberately to engineer an enhancement, or even merely to safeguard the maintenance, of the Generation Cycle's positive service to mortal men as a culturally profitable regulator of social change. In a rationally ordered world, in which a progressive improvement in record-taking and in education had reduced the wastage of Man's social heritage through the Generation Cycle to vanishing-point, it was conceivable that Mankind might one day wake up to find that, in the act of making itself master of the Generation Cycle, it had enslaved itself to the tyranny of an indelible tradition no less cramping than the indelible instincts into which, for ages past, a *ci-devant* Intelligence had been petrified in the Spartan-like universe of the Ants and the Bees.

When we pass on from the Generation Cycle to social processes with a vastly longer wave-length, such as a series of war-and-peace cycles running to three or four revolutions of 'the sorrowful wheel', or the disintegration of a broken-down civilization in the eight-or-ten-centuries-long course of a Time of Troubles and an ensuing universal state, our present question whether laws of Nature current in History are inexorable or controllable assumes a form in which—however academic it might have looked in Western eyes at any date during the two and a half centuries ending in A.D. 1914—this question was now insistently presenting itself to an increasing number of minds in the Western World on the morrow of what had been the second world war within living memory.

When a civilization had once broken down and entered on the path of disintegration, was it doomed already in advance to go on following this path to the point at which it would end in dissolution? Or was there a possibility of retracing one's steps—at any rate so long as the broken-down society had not yet slipped farther down than the upper and less precipitous slopes of the *descensus Averni*? In A.D. 1952 this question could no longer be ignored or dismissed by any citizen of a Western Society who had any sense of History (and this sense seemed to be becoming more acute, as it is apt to become in days of increasing distress and anxiety). At the same time there was no guarantee that an increasingly anxious post-Modern Western Man would be in any way better placed for finding an answer to the riddle of the Sphinx than his persistently self-complacent Late Modern Western forebears would have been if the same fateful question had ever rung in their ears.

Perhaps the strongest practical motive for the interest that was undoubtedly being taken by the writer's Western contemporaries in a synoptic study of the history of Man in Process of Civilization was an eagerness to take their historical bearings at a moment in the history of their own civilization which they felt to be a turning-point. In this crisis

the Western peoples, and the American people perhaps above all, were manifestly conscious of a load of responsibility that was weighing upon them. 'See, I have set before thee this day Life and Good and Death and Evil.'¹ Mid-way through the twentieth century of the Christian Era, Westerners saw themselves confronted with choices which might perhaps decide the fate, not merely of their own society, but of all Mankind; and, in looking to past experience for light to guide them in taking momentous decisions, they were turning to the only human source of wisdom which had ever been at the disposal of Mankind—though wise men had also never failed to recognize that the lessons of experience could not be applied automatically to grind out cut-and-dried solutions for current problems. In the twentieth century, Western minds were seeking in Mankind's historical experience for such guidance as experience could be expected to give; but they could not turn to History for light on how they ought to act without first putting to the oracle the preliminary question: Did History give them any assurance that they were really free agents? The lesson of History, after all, might turn out to be, not that one choice would be better than another choice, but that their sense of being free to choose was merely a flatteringly oppressive illusion, and that in truth it was out of their power to affect their own future. A comparison of the unfinished history of the Western Civilization with the histories of other civilizations in which the whole story was already known from beginning to end might inform the living generation of Westerners that they were in a phase in which their future no longer lay even partially in their own hands. The lesson of History might be that there was nothing now for them to do except to recognize, and resign themselves to, a doom from which there was no possibility of escape.

Was there indeed a stage in the disintegration of a civilization at which it ceased to be possible for human intellects and wills to recover control and to make use of this recaptured power by taking rational steps to avert an irretrievable disaster? In the regularly recurring pattern of the disintegration-process there was at least one landmark that was so outstanding as to be unmistakable whenever it was reached, and this was the termination of a Time of Troubles through the establishment of a universal state as a result of the forcible liquidation of all previously contending parochial states save one. At stages in the course of disintegration before this mark was reached and passed, was a recovery still feasible? In answer to this first question, perhaps the most that could be said was that, among all the untoward developments that were characteristic of a Time of Troubles, there was no sign of any that would make a recovery inherently impossible, though no doubt it would always be harder to recover from a relapse after a rally than to recover from an original breakdown that had not yet been repeated. The second question that presented itself was whether there was likewise no ground for assuming a recovery to be impossible after the establishment of a universal state, and in this case we might find ourselves giving a decidedly pessimistic answer with rather more assurance than we might have felt in giving a tentatively optimistic

¹ Deut. xxx. 15. Cp. 19.

answer to an identical question regarding the prospects during a Time of Troubles.

When once a Time of Troubles has passed over into a universal state, there are manifest inherent obstacles to recuperation that are so serious that they may well be insurmountable. To begin with, it is difficult to imagine how a society could have purchased peace at this price without having involuntarily inflicted mortal wounds upon itself. The price of a *pax oecumenica* imposed through the establishment of a universal state is, after all, a sacrificial price; for it is nothing less than the elimination, by force of arms, of all the previously contending parochial states save one which, if it does not die of its wounds, has to pay for its survival by suffering a grievous derangement of its life; and, in this political hecatomb, the parochial *regna peritura* themselves are the least valuable of the treasures that are destroyed; for, in the process of becoming the idols of infatuated communities, these political Juggernauts have a way of centring round themselves many of the non-political elements in a now disintegrating civilization's life; and, by the time when the progressive exacerbation of the Time of Troubles has come to threaten the stricken society with imminent death, it is as impracticable to overthrow these idols without simultaneously shattering the treasures now inextricably associated with them as it is imperative to overthrow these idols, whatever the cost. 'Ubi solitudinem faciunt, pacem appellant'¹ is, for this reason, an indictment on which all architects of universal states are bound in the nature of the case to be found guilty; and, for our present purpose, it is beside the point to argue whether or not the stricture is morally just; for, however convincingly the defendant may plead that he has saved a suffering world from a greater evil at the cost of inflicting on it a lesser evil in a situation in which no third choice was open to him, he will find it difficult to rebut the charge that even this lesser evil to which he has thus made himself a party is in the first place irretrievable and in the second place necessarily fatal in the long run to the afflicted body social.

If we may employ the homely simile of the eggs and the omelette, and identify the eggs with our clutch of contending parochial states, we may say that, during a Time of Troubles, down to the moment when it is liquidated through the establishment of a universal state, some, at any rate, of the eggs are likely to have remained unbroken, however severely even these may have been battered; but, when once the cook has converted all that is left of the eggs into an omelette, he has put it beyond his own or anyone else's power ever to reconstruct the eggs again by the impossible feat of putting scrambled yolks back inside broken shells. Moreover, as we have noticed in another context,² the chef's successors will find it beyond their power to preserve even the scrambled relics of broken eggs unadulterated, though, in originally making the omelette, the cook was aiming solely at preserving at least some recognizable vestige of his drastically processed raw materials. Time soon shows that the omelette will not keep without an infusion of preservatives, and these indispensable condiments inevitably de-nature the omelette's texture

¹ Tacitus: *Agricola*, chap. 30.

² In VI. vii. 57-60.

and taste, so that the pursuit of a conservative policy produces an unintended innovatory effect which plays straight into the hands of an insidious Spirit of Change. In our foregoing study of universal states¹ our principal conclusion has been that the conservative-minded makers and masters of universal states work, willy-nilly, for future destroyers, supplanters, and heirs of the civilization which the empire-builders themselves have been striving to make immune against the assaults of decay and death.

On this showing, it looks as if the process of social disintegration is likely to become inexorably irreversible if and when the disintegrating society passes out of a Time of Troubles into a universal state; and this finding raises the further question: Is there any remedy, short of the fatal imposition of a universal state, for the progressively more and more destructive fratricidal warfare between contending parochial states which appears to be the commonest symptom of a social breakdown?

If we try to answer this question empirically, as we ought, in the light of the historical evidence presented by the histories of civilizations up to date, we shall have to report that, out of some fourteen clear cases of breakdown, we cannot point to one in which the malady of fratricidal warfare had been got rid of by any means less drastic than the eventual elimination of the war-making parochial states themselves; but, in accepting this formidable finding, we must not allow ourselves to be discouraged by it; for a loyalty to the empirical method of investigation that requires us to be frank also requires us at same time to be judicious. The inductive method of reasoning is, after all, even at best, notoriously an imperfect logical instrument for proving a negative proposition, and the smaller the number of the instances under review the weaker, of course, the argument is. Now, at the time of writing, the number of known specimens of societies of the species 'civilizations' amounted, on the largest admissible count, to something less than thirty, and the species itself was apparently not more than some 5,000 or 6,000 years old, which was a brief span by comparison with the 300,000 or 600,000 or 1,000,000 years during which societies of a primitive kind had been in existence since the days before a sub-human social animal had achieved its mutation into Man. Against this historical background it was evident that the experience of some fourteen civilizations over a span of some five or six millennia established no very strong presumption against the possibility that, in response to the challenge by which these pioneer civilizations had been worsted, some other representative of the infant species might succeed some day in opening up a hitherto unknown avenue for a fresh and unprecedented spiritual advance by finding some less prohibitively costly device than the forcible imposition of a universal state for curing the social disease of fratricidal warfare between parochial states.

If, with this possibility in mind, we now glance back, once again, at the histories of those civilizations which, by the time of writing, had trodden the whole length of the *via dolorosa* leading from breakdown to dissolution without having managed to stop short of taking the perhaps irretrievable step of passing into a universal state, we shall observe that

¹ In VI, *passim*, in vol. vii.

at least some of them had caught a Pisgah sight of a saving alternative solution, even though none of them had ever yet succeeded in translating this ideal into an achievement.

In the Hellenic World, for example, the vision of a Homonoia or Concord that might do what Force could never do towards healing a deadly strife between contending states and contending social classes, and even between contending civilizations, had unquestionably been caught by certain rare Hellenic souls¹ under the spiritual stress of a Time of Troubles that had set in at the outbreak of the Atheno-Peloponnesian War of 431-404 B.C.—even though this glimpse of a happier alternative possibility had not availed to save the Hellenic Society from continuing to tread the path of destruction to the point at which a temporary reprieve had been purchased, through the imposition of a Roman Peace, at the cost of making the Hellenes' descent of Avernus irretrievable. In a post-Modern Western World the same ideal had been embodied, in response to the challenge of two successive world wars, in two successive oecumenical institutions—in the League of Nations after the War of A.D. 1914-18, and in the United Nations Organization after the War of A.D. 1939-45. In Sinic history during the Sinic Society's first rally after its breakdown, Confucius's zeal for the revivification of a traditional code of conduct and ritual and Lao-tse's quietist belief in leaving a free field for the spontaneous operation of the subconscious psychic forces of Wu Wei² had both been inspired by a yearning to touch springs of feeling that might release a saving power of spiritual harmony; and in the Sinic, as in the Western, World this yearning had also found institutional expression. In 681-679/8 B.C., for example, at a date when the progressive assertion of rival parochial sovereignties *de facto* was already threatening the Sinic Society with the breakdown that it eventually brought upon itself in 634 B.C., an attempt was made to provide an effective substitute for a now shadowy oecumenical presidency of the Imperial House of Ch'ou by an international recognition of the hegemony of one of the leading parochial Powers of the day;³ and at least two Powers in turn

¹ There could be no doubt that this idea which was at the same time an ideal had made its epiphany in the Hellenic World in the course of its Time of Troubles; the only point in dispute between latter-day Western scholars was the question: Whose soul was it that was to be given the credit for having caught the vision first? For the debate between the respective champions of Alexander of Macedon and Zeno of Citium, see V. vi. 6, n. 4. Since the publication of that volume of the present Study, the debate had been carried farther. Alexander's advocate, Sir W. Tarn, had expounded his theory more fully in his masterly work *Alexander the Great* (Cambridge 1948, University Press, 2 vols.); and, according to this exposition (in op. cit., vol. ii, pp. 447-8), Alexander's ideas about Brotherhood and Unity could be seen to be 'three facets of a single idea':

'The first is the statement that all men are brothers; Alexander was the first man known to us, at any rate in the West, to say so plainly and to apply it to the whole Human Race, without distinction of Greek or Barbarian. The second thing is his belief that he had a divine mission to be the harmonizer and reconciler of the World, to bring it to pass that all men, being brothers, should live together in Homonoia, in unity of heart and mind. . . . The third thing . . . was the desire, expressed in the libation and prayer at Opis, that all the peoples in his realm should be partners and not merely subjects.'

In *Classical Philology*, vol. xlv, No. 3, July 1950, Tarn's contentions had been disputed by Philip Merlan in a paper under the title 'Alexander the Great or Antiphon the Sophist?' in which the writer argues that 'the idea of the equality of all men, Greeks and Barbarians alike', had been 'proclaimed, a century before Alexander the Great', by the fifth-century Athenian man of letters Antiphon in his work called *Truth*.

² See III. iii. 187 and V. v. 416-19.

³ The first hêgemôn in the series, Huan, the prince of the parochial state Ts'i, secured

duly exercised this authority in the name of the Chóu before this embryonic constitution for a Sinic League of Nations fell into abeyance.¹ Thereafter, there were occasional revivals—as, for instance, in 546 B.C.²—of the international conferences for the preservation of peace between parochial states which, between 679 and 628 B.C., had been convened under the successive hegemonies' auspices. It was not until after the opening of the second chapter in a Sinic series of war-and-peace cycles that the contending states finally abandoned their half-hearted quest for some way of living peacefully side by side, and allowed their fratricidal warfare to degenerate into a sheer struggle for existence; and, even after the onset of this second paroxysm of a Sinic Time of Troubles, the moderating institution of hegemony seems to have been revived once or twice.³

These Sinic, Hellenic, and Western essays pointed to a possibility of preventing the perhaps inevitable friction between parochial states from grinding a body social to powder by recourse to some remedy less drastic than the shattering of these trouble-making idols at the cost of mortal injury to the suffering society itself. As an alternative to the forcible imposition of a universal state, which had invariably proved in the event to have been a lethal remedy for a mortal disease, might not some civilization some day succeed in responding to the challenge of breakdown by inducing the loyal subjects of still unliquidated parochial states voluntarily to subordinate their parochial patriotisms to an overriding allegiance to some paramount oecumenical institution which would be a political embodiment of the whole of the society and not just of one or other fragment of it? Would not some such new solution for an old political problem offer a more favourable expectation of life to the parochial states themselves, as well as to the society of which these were political articulations? Surely, if these parochial states ceased to be a menace to the survival of the society in virtue of ceasing to be objects of idolatrous worship, then their votaries need no longer have to face the agonizing choice of allowing their idolization of these parochial political institutions to break the society up or else acquiescing in the preservation of the society at the all but prohibitive price of allowing the parochial states, and all the treasures associated with them, to be liquidated in order to make way for a universal state imposed by force.

The objective on the political plane was to find a middle way between two mutually antithetical deadly extremes: a devastating strife between

the recognition of his hegemony by the states represented at a congress which he convened in 681 B.C. This arrangement was embodied in a formal diplomatic instrument in 679/8 B.C. (see Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), p. 161).

¹ The two hégemonies whose hegemonies seem to be historical are the first two out of the five in the traditional list: Prince Huan of Ts'i (*dominabatur* 685–643 B.C.) and Prince Wên of Tsin (*dominabatur* 635–628 B.C.). In Franke's opinion (see op. cit., vol. i, p. 162) the hegemonies of the three last princes on the list are not so well attested by the historical evidence, and Franke suggests that these three were included in order to make up the tale of five, because of the significance of this number in the conventional system of Sinic thought. The Time-span of the Age of the Hegemonies in Sinic history would thus be 685–628 B.C. instead of 685–591 B.C., which is the traditional dating.

² See I. i. 89 and V. vi. 292.

³ In this period there may have been some recognition of the hegemony of King Kou-tsen of Yüé (*regnabat circa* 500–470 B.C.) and of Prince Hiao of Ts'in (*dominabatur* 361–338 B.C.) according to Franke, op. cit., vol. i, pp. 162 and 177–8.

irreconcilable parochial states and a desolating oecumenical peace imposed through the delivery of a knock-out blow. The reward for success in running the gauntlet of these adamantyne Symplegades, whose clashing jaws had crushed every vessel that had attempted to make the passage up to date, might be the Argonauts' legendary experience of bursting out of the perilous straits into a hitherto un-navigated open sea. If the children of one of the civilizations one day were to accomplish this feat of pioneering, such an achievement might well open a new chapter of history with a new spiritual climate. It was obvious, however, that this happy issue out of some of the afflictions that Man had been bringing on himself in the Age of the Civilizations could not be ensured by any talismanic blue-print of a federal constitution for an oecumenical polity. The precise constitutional arrangements best calculated to secure the saving harmony of multiplicity-in-unity and unity-in-multiplicity would necessarily vary according to the nature of the particular circumstances in which the challenge presented itself; and the most adroit and opportune political engineering applied to the structure of a body social could never serve as a substitute for the spiritual redemption of souls. Such proximate causes of breakdown and disintegration as the horizontal schism cleft in the Body Social by warfare between parochial states and the vertical schism cleft in it by strife between classes were in truth no more than political symptoms of a spiritual disease; and a wealth of experience had long since demonstrated beyond dispute that technically perfect institutions were of no avail to save froward souls from bringing themselves and one another to grief, whereas brethren who had attuned their wills to dwell together in unity would find no insuperable difficulty in making technically imperfect institutions work by short-circuiting a mimetic social drill through flashes of 'light caught from a leaping flame'¹ and by subordinating the things that are Caesar's to the things that are God's.²

If the prospects of Man in Process of Civilization, on his arduous climb up a precipitous cliff-face towards an unattained and invisible ledge above,³ evidently depended above all on his ability to recover a lost control of the pitch, it was no less evident that this issue was going to be decided by the course of Man's relations, not just with his fellow men and with himself, but, above all, with God his Saviour.

¹ Plato's Letters, No. 7, 341 B-E, quoted in III. iii. 245.

C. THE RECALCITRANCE OF HUMAN AFFAIRS TO LAWS OF NATURE

(I) A SURVEY OF INSTANCES

(a) THE VARIABILITY OF THE RATE OF CULTURAL CHANGE

1. *The Hypothesis of Invariability and the Evidence against it*

IN the preceding division of this Part we have come to the conclusion that there are laws of Nature to which human affairs are amenable; but the same empirical survey of historical facts that has borne witness to the currency of these laws has also informed us that they are not inexorable.

We have found that laws of Non-Human Nature which Man cannot abrogate or even modify can nevertheless be brought under human control in the sense that Man can elude the incidence of these laws when their operation would have frustrated his purposes, and court it when this will serve them. Though, for example, Man is powerless to change either the direction or the force of the winds, he can trim his sails to catch winds that will carry his ship towards the port for which he is making; he can design a rig that will enable him to take advantage of almost contrary winds by sailing in their eye; and, when he encounters a hurricane blowing dead against him, he can reef his sails and thus mitigate the impact of the blast. By adroitly steering the course of human affairs amid the play of non-human forces subject to rigid and therefore calculable and predictable laws, Man can prevent potentially adverse laws from hindering him and can constrain potentially favourable laws to help him in the execution of his plans; and, where the laws of Nature with which he is confronted are laws of the Human Psyche, Man can bring these laws, likewise, under human control in the sense that he can diminish the discord and increase the harmony in human life by reconciling personal wills that are bound to encounter one another in the life of a creature that had to become social before it could become human, and by bridging the gulf between each of these conscious personalities and the Subconscious Psyche with which any personality is bound to be mated in the life of a creature in whose soul the Spirit could never have moved except upon the face of the waters,¹ and which could never have been made to see the light except against the foil of the darkness.²

Such evidences of Man's ability to control his own affairs either by circumventing laws of Nature or by harnessing them raise the question whether there may not be some circumstances in which human affairs are not amenable to laws of Nature at all. We can explore this possibility by following the same empirical method of inquiry that we have just been employing in order to ascertain the extent of Nature's dominion over Man; and we may begin by inquiring into the rate of social change. If the tempo proves to be variable, this will be evidence, as far as it

¹ Gen. i. 2.

² Gen. i. 4.

goes, that human affairs are recalcitrant to laws of Nature in the Time-dimension at least. We cannot, however, take the variability of the rate of social change for granted.

In studying the phenomena of social disintegration, we have found that the disintegration-process has run a regular course which it has followed uniformly in a dozen divers instances up to date. It has invariably opened with a Time of Troubles which has invariably passed over into a universal state; the transit from the outbreak of the Time of Troubles, signifying the civilization's breakdown, to the break-up of the universal state, signifying the civilization's dissolution, has invariably been accomplished within the compass of three and a half revolutions of a Rout-and-Rally Cycle; and this process has invariably taken a minimum period of eight centuries to work itself out, while its maximum period has never been as much as eleven hundred years. Moreover, the rules of this process have been proved by the apparent exceptions.

When a universal state has been interrupted, before it has completed its regular Time-span of some four hundred years' duration, by the impact of an alien body social, the assaulted society has declined to accept this intervention as a *coup de grâce* and has obstinately prolonged its own existence until it has found an opportunity to swing back into the regular course of the disintegration-process by resuming its interrupted universal state and, this time, abiding in it until this phase of social experience has produced the full psychological effect that it has been its function to produce according to the disintegration-process's hitherto standard pattern. This process that has thus refused to allow an external agency to prevent it from working itself out has likewise been intractable to attempts to tamper with it from within. A universal state that has completed the full normal period of its course may have perversely insisted on superfluously prolonging the tale of its years; but we have seen that in every case it has broken up in the end, however long it may have succeeded in postponing the evil day; and we have also seen that in every case this illegitimate epilogue has been barren of creative achievements. The vanity of all such attempts to set the laws of social disintegration at defiance testifies to the inexorability of these laws so impressively, and this law-bound process of social disintegration has loomed so large in the history of the societies of the species 'civilizations' during the first five or six thousand years of this species' existence, that we are moved to ask ourselves whether the time-keeping propensity which has thus displayed itself in the disintegration-process over a span of something between a minimum of about eight hundred and a maximum of about a thousand years may not govern the histories of civilizations, not only when these societies are disintegrating, but also when they are still in growth.

If the tempo of History should indeed prove to be constant in all circumstances, in the sense that the passage of each and every decade, century, or millennium could be shown to generate a definite and uniform quantum of psychological and social change, it would follow that, if we knew the value either of a quantum in the psycho-social series or of a span in the Time-series, we should be able to calculate the

magnitude of the corresponding unknown quantity in the other series. Supposing, for example, that, in the history of civilization α , a generation β were known to be separated from a generation α by a Time-interval of, say, one hundred years, we ought then to be able to estimate the psychic and social distance between these two generations, even if their chronological relation to one another were the only information about them that we had on record. Conversely, if we knew the psychic and social difference between two generations, thanks to being informed about their respective manners and customs by undated records such as folk-tales handed down orally or the material evidence of stratified artifacts disinterred by archaeologists, we ought then to be able to estimate the chronological interval between them by inference, even if we had not inherited or recovered any table of dates to tell us their chronological relation to one another in plain figures. The assumption that a particular quantum of psycho-social change invariably takes the same span of Time in accomplishing itself had become so unquestionable an article of faith in the mind of at least one distinguished Modern Western student of Egyptiac history that he actually rejected the chronological data presented by Astronomy on the ground, not that this evidence was dubious in itself, but that to accept it would mean accepting, in consequence, the, to him, inadmissible proposition that the tempo of psycho-social change in the Egyptiac World must have been notably quicker during one period of two hundred years' length than it had been during an immediately preceding period of an approximately equal span.

'If we find that the heliacal rising of Sirius is noted in an Egyptian document as falling in a certain month of a certain year in the reign of a certain king, it would seem that by calculating the loss of days implied we could discover the year B.C. to which the given year corresponds. On this principle, by means of a statement in a papyrus found at Kahun, that Sothis rose heliacally on the first of the month Pharmouthi in the seventh year of Senusret III, it has been computed that this year was 1882 (1876) or 1876 (1872) B.C., while from the same data another computer has arrived at 1945 B.C. But there are many considerations which militate against an unreserved acceptance of either of these dates, in the present state of our knowledge. If the former date were accepted, the end of the XIIth Dynasty would fall in 1788 B.C.¹ But it will be admitted by all who have studied the material for the history of the time that to allow only two centuries for the period between Dynasties XII and XVIII is difficult. If there are resemblances in culture between the XIIth and the early reigns of the XVIIIth Dynasty which argue a comparative proximity in time, there are, on the other hand, differences which cannot be accounted for if the distance is to be measured by no more than two hundred years. The XIIth Dynasty itself lasted for two centuries. Are the changes observable during its continuance in any way comparable to those which had come

¹ The last (incomplete) year of the Twelfth Dynasty's régime would be, not 1788 B.C., but 1778 B.C., according to L. H. Wood's revision (in the *Bulletin of the American Schools of Oriental Research*, No. 99, October 1945 (New Haven 1945, A.S.O.R.), pp. 5-9) of W. F. Edgerton's chronology (in the *Journal of Near Eastern Studies*, vol. i (Chicago 1942, University of Chicago Press), pp. 306-14). R. A. Parker, in *The Calendars of Ancient Egypt* (Chicago 1950, University of Chicago Press), p. 69, makes the last year of the Twelfth Dynasty's régime 1786 B.C.—A.J.T.

about between its termination and the rise of the XVIIIth? The answer can only be a decided negative.¹

This answer might be correct; yet it would not avail, by reason of that, to prove the case which is here based upon it. It might be true that, during the interval between the end of the Twelfth Dynasty and the beginning of the Eighteenth Dynasty, the Egyptiac culture had changed more than it had changed while the Twelfth Dynasty had been on the throne; but it would not follow that the time taken by the greater of these two unequal quanta of change must have been proportionately longer than the time taken by the lesser quantum. So far from its being requisite to assume that the rate of change must have been constant, it would be surprising if the pace of change had in truth been the same in two periods which were so different from one another in their social circumstances. The second of the two was an anarchic interregnum in which we should expect the pace of change to accelerate, whereas the preceding period was a time of relative peace, order, and stability in which we should expect the pace of change to be sluggish. An expectation based on this difference in character between two periods would thus have anticipated the astronomical evidence indicating that the greater quantum of change during the second period took no longer a time to come to pass than the smaller quantum during the first period; and, in fact, by the time when the present chapter of this Study was being written in A.D. 1950, the consensus of Egyptologists had declared itself unmistakably in favour of accepting the chronological evidence of Astronomy without regard for an unconvincing hypothetical law to the effect that the tempo of psycho-social change is not subject to variation.

This judgement of common sense is strikingly vindicated by indisputable facts in a number of cases in which the spans of time taken by cultural changes comparable in character to the change from a Twelfth-Dynasty culture to an Eighteenth-Dynasty culture in Egyptiac history are known to us from chronological records that cannot be impugned by any subjective estimate of the time required for allowing these cultural changes to take place.

For example, we know for a fact that the remains of the Temple of Zeus at Olympia and of the Parthenon at Athens which are still standing in our day date from the fifth century B.C.; that the remains of Hadrian's Olympieum at Athens and of the Temple of the Sun at Ba'lbak date from the second century of the Christian Era; and that the Church of the Ayía Sophía at Constantinople dates from the sixth century of the Christian Era. Supposing, however, that we had no record of any of these dates, and that in the absence of direct evidence we tried to reconstruct the chronology by making an estimate of the Time-intervals between the dates of the three sets of buildings on the basis of Hall's assumption that the tempo of cultural change is invariable, we should be bound to guess that the Time-interval between the Olympieum and the Ayía Sophía—representing, as these two buildings do, two orders of architecture that are, not merely diverse, but antithetical in their styles,

¹ Hall, H. R.: 'Egyptian Chronology', in *The Cambridge Ancient History*, vol. i, 2nd ed. (Cambridge 1924, University Press), pp. 168-9.

inspiration, and *êthos*—must be notably longer than the Time-interval between the Parthenon and the Olympieum, considering that the Olympieum is manifestly a mere variation on the Parthenon's architectural theme. In reality, as we happen to know, beyond dispute, the Time-interval between the Parthenon and the Olympieum, so far from being notably shorter than the Time-interval between the Olympieum and the *Ayía Sophía*, was half as long again, and an estimate of the relative length of the intervals, based on the hypothesis of invariability in the tempo of change, would be utterly misleading.

If we turn our attention from ecclesiastical to naval architecture and apply the hypothesis of invariability in the tempo of change to the dating of successive types of battleship in the history of the British Navy, we shall find ourselves inveigled into inferring that the *Sovereign of the Seas* (launched in A.D. 1637) must have been separated from the *Queen* (launched in A.D. 1839)¹ by a notably shorter Time-interval than that separating the *Queen* from the *Royal Sovereign* (launched in A.D. 1891). On this *a priori* method of reckoning, no other conclusion would be plausible, considering that the *Queen* was a wooden three-masted square-rigged sailing ship with her guns mounted along her broadsides, whose points of difference from the *Sovereign of the Seas* were merely points of detail, whereas the *Royal Sovereign*, with her gun-turrets fore and aft and her iron hull, steel armour, pair of funnels, and propellers driven by steam, was a Martian sea-monster that would not have been recognized as being a ship, in any intelligible sense of the word, by any sailor in Codrington's squadron at Navarino on the 20th October, 1827.

We should be similarly misled if we were to put our trust in the same *a priori* principle in trying to estimate the relative Time-intervals between the equipment of a Roman soldier in the last days of the Roman Empire in the West, a Saxon soldier in the *comitatus* of the Holy Roman Emperor Otto I, and a Norman knight depicted on the Bayeux tapestry. Considering that the round shields and the gladiator's square-rimmed crested helmets with which Otto's soldiers are equipped are manifest variations on the equipment of Majorian's soldiers,² whereas William the Conqueror's soldiers are equipped with Sarmatian conical helmets

¹ 'As late as 1845 there was laid down at Devonport a *Sanspareil* designed upon the lines of the ship of the same name captured from the French in 1794, although, it is true, the vessel was never actually launched as a sailing line-of-battle ship, but, while yet upon the stocks, was lengthened, converted to a screw ship of 80 guns, and launched as such in 1851' (Clowes, W. L.: *The Royal Navy: A History*, vol. vi (London 1901, Sampson Low, Marston, & Co.), p. 191). 'The first [British] ship of the line to be designed, *ab initio*, for the screw was the *Agamemnon*, which was laid down at Woolwich in 1849, and launched in 1852' (*ibid.*, p. 191). [British] wooden battleship, though fitted with a screw, was the *Collingwood* of 1861' (Mr. Christopher Lloyd, of the Navy Records Society, in a letter of the 23rd January, 1951, in which he kindly gave this information to the Librarian of the R.I.I.A. in answer to an inquiry made on the present writer's behalf).

² No doubt we have to allow for the possibility that the portrayal of a tenth-century Western soldier's equipment may have been influenced by a perhaps unconscious conservatism that may have made it look more like a fifth-century Roman soldier's equipment than it actually was; but such conservatism cannot have gone so far as to blind Western artists in the Dark Ages to the visual evidence, for they did not ignore the new-fangled equipment of an eleventh-century knight; on the contrary, they evidently took a delight in reproducing it faithfully to the facts. On this showing it seems reasonable to assume that their portrayal of a tenth-century Western soldier's equipment is likewise essentially true to life.

and with kite-shaped shields, the hypothesis of invariability in the tempo of change would lead us, here too, to fly in the face of the chronological facts by guessing that the Time-interval between Otto I (*regnabat et imperabat* A.D. 936-73) and William the Conqueror (*ducebat et regnabat* A.D. 1035-87) must have been notably longer than the Time-interval between Majorian (*imperabat* A.D. 457-61) and Otto I.

In the three cases just cited, estimates based on the assumption that the tempo of change is invariable fall wide of the true chronological marks because in reality the tempo was not constant. In all these three cases a spell of relatively slow cultural change was succeeded rather abruptly by a spurt of relatively fast change. We may complete our exposition of the argument against the hypothesis of invariability in the tempo of change by citing an inverse case in which a spurt of fast change was succeeded by a spell of slow change.

Anyone who takes a synoptic view of the standard Western male (non-military and non-clerical) dress as worn in A.D. 1700 and in A.D. 1950 respectively will see at a glance that the coat, waistcoat, trousers, and umbrella of A.D. 1950 are merely variations on the coat, waistcoat, breeches, and sword of A.D. 1700. By contrast, the doublet and trunk-hose of A.D. 1600 are as different from the Western civilian costume of A.D. 1700 as the Western military equipment of A.D. 966 is from the Western military equipment of A.D. 1066. If a child ignorant of the dates were asked to guess, from a series of pictures of celebrated Western poets, which two of our three sets of costumes were separated from one another by a Time-interval of a century and a quarter, and which two by an interval of two centuries, the innocent child would assuredly guess that the century and a quarter was the interval between Pope (*natus* A.D. 1688) and T. S. Eliot (*natus* A.D. 1888), and that the two centuries was the interval between Shakespeare (*natus* A.D. 1564) and Pope (*natus* A.D. 1688).

These cautionary tales are warnings against the danger of confiding in an hypothesis of invariability in the tempo of change as a basis for trying to estimate, not only the Time-interval between an Egyptiac Middle Empire and New Empire, but also the length of time that it took for successive strata of the debris of human occupation to accumulate on some site whose history has to be reconstructed solely from the material evidence disinterred by the archaeologist's spade, in default of chronological data furnished by independent, decipherable, and authoritative written records.¹ If, for example, we were tempted to compute the dura-

¹ Such an attempt to work out an absolute chronology by inference from the thickness of strata of deposits has, of course, to be distinguished from an attempt to estimate the relative age and duration of the strata deposited on different sites within the same broad cultural field by comparing the likeness and differences between their respective contents, on the lines of C. F. A. Schaeffer's monumental and masterly *Stratigraphie Comparée et Chronologie de l'Asie Occidentale (iii^e et ii^e Millénaires): Syrie, Palestine, Asie Mineure, Chypre, Perse et Caucase* (London 1948, Oxford University Press). In comparing the successive strata on different sites, Schaeffer is comparing entities that are legitimately comparable. The error in method lies in assuming that the tempo of change is constant and that it is therefore feasible to argue from the thickness of strata to duration of Time, or vice versa. Absolute chronological values cannot be assigned to strata of debris with any likelihood of accuracy unless two conditions are satisfied. In the first place the stratum that is to be dated must contain some object bearing evidence of having

tion of the Neolithic Age on the site of Cnossos by measuring the thickness of the Neolithic deposits and reckoning that these were laid down at a constant rate of so many feet per century, without allowing for the possibility that the rate of deposit might have been slower at the dawn of the Neolithic Age than on the eve of the Chalcolithic, we should be well advised, before we committed ourselves to this wild-goose chase, to take to heart the two pertinent facts that the cubic content of the archives deposited in Whitehall during the six war years A.D. 1939-45 was equal to that of all extant British archives deposited before September 1939, and that the cubic content of the mineral ore mined by Mankind during the quarter of a century ending in the year A.D. 1925 was equal to that of all the ore that had ever been mined down to the year A.D. 1900 inclusive.¹

The second of these two facts ought to warn us against attempting to estimate age by measuring height, whether we are practising on a slag-heap or on a *tell*. This procedure might perhaps be legitimate if we were dealing with an ant-heap or with a termitary, since the insect societies which deposit these inanimate material traces of their life have been in stable equilibrium with their environment² for ages beginning long before the epiphany of the Human Race. It might even be legitimate to assume the rate of deposit to be a constant if we were dealing with primitive human societies in their latter-day Yin-state (the only state in which we have any knowledge of them)³—always supposing that we could lay hands on a primitive society, either still alive or else extinct yet still on record, which was uncontaminated by the radiation of any of the civilizations and which had deposited debris comparable in size and solidity, scale for scale, with a termite community's baetyl-like phalanstery. However that may be, the hypothesis of invariability in the tempo of change is manifestly not legitimate when we are dealing with civilizations, considering that the distinguishing mark of their rhythm is an

been manufactured during some particular reign or some other independently well-defined and limited unit of Time. In the second place the reign or other Time-unit with which the stratum has thus been identified must be assignable to some definite place in a chronological table continuous with the well-established chronology that begins in Egyptian history *circa* 1580 B.C. with the inauguration of the New Empire by Amosis and which runs on thence without a break until it passes over into the Christian Era.

¹ These two statements of fact both have the sanction of high authority. The second of them was made by Professor C. K. Leith, of the University of Wisconsin, at a lecture at the Williamstown Institute of Politics in August 1925 at which the writer of this Study was present in the audience; the first was verified by the writer at a conference on war documentation at Amsterdam in September 1950 in conversation with Professor W. K. Hancock, the scholar in charge of the production of official histories of the acts of the divers departments of the Government of the United Kingdom during the War of A.D. 1939-45.

A reiteration of Leith's statement is on record in a book published eighteen years after the delivery of the lecture. 'The burst of industrialisation since the opening of the present century has intensified the use of minerals, both in volume and [in] variety. In this forty-years period of industrial expansion the World has used more of its mineral resources than in all preceding history' (Leith, C. K.: *World Minerals and World Peace* (Washington, D.C. 1943, The Brookings Institution), p. 1). Leith's estimate of the acceleration in the use of minerals in general is corroborated by another contemporary expert's estimate of the acceleration in the use of copper. 'The total world production from earliest times up to 1910 has been estimated at 21 million tons. In the years 1911-1930 a further 25 million tons have been extracted' (Högbom, I.: 'Mineral Production', in the *Proceedings of the Royal Swedish Institute for Engineering Research*, No. 117 (Stockholm 1932, Svenskabokhandelscentralen), p. 29).

² See III. iii. 106-10.

³ See I. i. 179-80.

instability that is equally characteristic of their growths and of their disintegrations.

2. *Instances of Acceleration*

We may perhaps usefully follow up our opening attack on the hypothesis that the rate of cultural change is invariable by making a brief survey of instances, first of acceleration, then of retardation, and, in the third place, of an alternating rate.

A familiar example of acceleration is the phenomenon of Revolution within the family circle of a single society; for Revolution, in this commonest current Western usage of the term, proves on analysis—as we have found, in a previous context in this Study¹—to be a social movement generated by an encounter between two communities which, though they belong to the same society, happen at the moment to be in different stages of evolution—military, political, economic, intellectual, or spiritual, as the case may be—differing markedly enough to stimulate the more backward of the two parties deliberately to quicken his pace with the intention of catching up, by a forced march, with his more forward neighbour and contemporary. In Late Modern Western history the classical example is the French people's revolutionary move, in and after A.D. 1789, to catch up with the constitutional progress, ahead of an eighteenth-century French *ancien régime*, that had been achieved in Great Britain and the United States by that date.

A rather more violent kind of revolution is generated by an encounter between marchmen on the fringe of a civilization and the more precociously cultivated denizens of the interior, when the marchmen set out to make good a cultural lag which in their case is apt to be greater than any cultural differentiation between one community in the interior and another. In Hellenic history the classical example is the Roman people's series of revolutionary moves to catch up, first with the constitutional progress of Athens, and afterwards with the social progress of Sparta. When Rome entered on her forced march in the fifth century B.C. she was, as we have seen,² some 140 or 150 years behind Athens, if we are right in equating the compilation of the Twelve Tables of Roman Law by the Decemviri *circa* 450 B.C. with the constitution that Solon worked out for Athens in and after 594 B.C. By the year 133 B.C., when Tiberius Gracchus launched in Italy a revolutionary programme of agrarian reform emulating the programme launched in Lacedaemon by King Agis IV in 243 B.C.,³ the Roman marchmen of the Hellenic World had reduced their Time-lag behind the communities in the heart of Hellas from nearly 150 years to no more than 110; but it took the century of revolution and civil war which Tiberius Gracchus undesignedly precipitated to enable Rome to draw right abreast of the farthest advanced of her Hellenic contemporaries. In the course of this terrible century the *stasis* within the bosom of the Roman Commonwealth became identical with the final paroxysm of an Hellenic Time of Troubles; and the no longer distinguishable tasks of bringing international peace to the Hellenic World and internal peace to the sole surviving Hellenic

¹ In IV. iv. 135–6.

² In IV. iv. 205.

³ See V. vi. 288, n. 4.

Great Power were both performed in the same act by an Augustus who combined a revolutionary dictatorship within the Roman body politic with a providential mission for the salvation of the Hellenic World in a personal union between the *deus ex machina* and the boss which made this Janus-headed statesman as great a hero in the eyes of Rome's intolerably oppressed subjects as it made him a villain in the eyes of a tardily chastened Roman senatorial aristocracy which had so long and so abominably abused its power.

This progressive acceleration of the Romans' pace in the course of Hellenic history is, of course, merely one outstanding example of the forced marches made by peoples on the fringes of a society's domain in order to catch up with more precociously cultivated peoples living nearer to the society's heart. In Minoan history, for instance, we catch glimpses—even through Archaeology's dark glass—of the Peloponnese progressively catching up with the Cyclades and Crete, Central Greece with the Peloponnese, and Thessaly with Central Greece.¹ When Thessaly passed out of her Neolithic into her Chalcolithic Age *circa* 2000 B.C., she was no less than 1,000 years behind the Peloponnese, the Cyclades, and Crete, which had all made the same transition *circa* 3000 B.C., and was 500 years behind even Central Greece, which had parted company from Thessaly by emerging from the Neolithic Age *circa* 2500 B.C. Thereafter, when Thessaly made the subsequent transition from the Chalcolithic Age to the Bronze Age *circa* 1580 B.C., she was only 620 years behind the Peloponnese, which had crossed the same line *circa* 2200 B.C., and no more than 820 years behind the Cyclades and Crete, which had crossed it *circa* 2400 B.C. At the end of the Minoan story, *circa* 1200 B.C., Thessaly plunged out of the civilization of the Bronze Age into the barbarism of the Iron Age² neck and neck with all the other provinces of a dissolving Minoan World—which means that, during the 380 years 1580–1200 B.C., Thessaly had covered the cultural distance which it had taken the Cyclades and Crete the 1200 years 2400–1200 B.C. to traverse. This series of comparative dates indicates that, in Thessaly in the time of the Minoan Civilization, there was a progressive acceleration of the cultural tempo in the course of eight hundred years ending at the turn of the thirteenth and twelfth centuries B.C.

Beyond the outermost marches of a civilization's geographical domain there lies a limbo tenanted by primitive societies whose children are potential converts to the culture of an adjoining civilization in its growth stage but become an alienated external proletariat when the civilization loses its attractiveness as the result of a breakdown.³ In an earlier context⁴ we have glanced at what happens to these transfrontier barbarians after the collapse of a universal state's military *limes* which has been

¹ See the chronological chart in Glotz, G.: *La Civilisation Égée* (Paris 1923, La Renaissance du Livre), pp. 28–31. Glotz's dating of strata of debris in the Minoan World is based on the presence there of objects of Egyptian provenance which have made it possible at least tentatively to translate the relative terms of Aegean stratigraphy into the absolute terms of Egyptian chronology from the date of the Eighteenth Dynasty's inauguration onwards.

² See III. iii. 160–1.

³ See V. v. 194–210.

⁴ In VIII. viii. 45–72.

damming the barbarians back for generations or perhaps even for centuries. By the time when the sudden bursting of a barrage that has been cultural as well as military brings the flood of Barbarism down in spate upon the long sheltered but now at last defenceless remains of a garden-city within the fallen ring-wall, the cultural differentiation between the unreclaimed barbarians and the sophisticated citizens of a cosmopolis has become so extreme that the effort of cultural acceleration required of the barbarian invaders, if they are to make good their Time-lag behind the conquered subjects of the vanished universal state, usually proves to be beyond the limits of the Human Psyche's adaptability. The barbarians' fate is therefore often an ironical one. The more sensational their military and political triumphs, the more demoralizing their spiritual *bouleversement* is apt to be.

These encounters between marchmen just within the fringe of a civilization's domain, or barbarians just beyond its pale, and the more highly cultivated communities in the interior are variations on the same historical theme as the encounters between representatives of two or more different civilizations; and in our study of these we have noticed that, when a civilization is hit by the impact of a more powerful and aggressive society of its own kind, one of the defensive responses that the children of the assaulted civilization are apt to make is the attempt to fight the aggressor with his own weapons which we have labelled 'Herodianism'.¹ Since Time is of the essence of the Herodian's problem if his policy is to be justified by success in making an assaulted society able to hold its own before it has been overwhelmed, Herodianism necessarily calls for an effort of cultural acceleration; and this is assuredly the explanation of the success of the Herodian movement which was an abortive Scandinavian Civilization's prevailing reaction to the impact of an early Medieval Western Christendom.

The writer of this Study vividly remembers the impression made on him by a visit to the Nordiska Museet at Stockholm in the summer of the year 1910. After passing through a series of rooms displaying *chefs-d'œuvre* of the Scandinavian Palaeolithic, Neolithic, Bronze-Age, and pre-Christian Iron-Age cultures, he was startled to find himself walking through a room displaying Scandinavian-made products of the Early Modern Age of Western history in the style of the Italian Renaissance. Wondering how he could have failed to notice the Scandinavian-made products of the Western Middle Ages, which must surely be on view in their due place in the sequence, the English visitor retraced his steps—to find that there was, sure enough, a Medieval room, but that its contents were so inconspicuous, by comparison with the trophies of the pre-Christian ages, that after all it was quite easy to traverse it unawares. Thus the visual impression made on a traveller through this series of rooms in a museum of Scandinavian arts and crafts was that Scandinavia had passed in a flash out of a Late Iron Age in which she had been beginning to create a promising distinctive civilization of her own into an Early Modern Age in which she had become an undistinguished participant in a standardized Italianate Western Christian culture; and

¹ See IX. viii. 580-623.

this impression faithfully reflected the patent historical truth that the Scandinavian peoples' *tour de force* of grafting themselves on to the stem of an alien Western Christian Civilization had been achieved by a forced march.

Part of the price of this feat of acceleration had been the cultural impoverishment to which the Nordiska Museet bore witness; for the banality of the Italianate Modern Western paraphernalia attesting the Scandinavians' success at that stage in drawing abreast of the main body of Western Christendom was thrown into relief by the inimitable excellence of the products of ages anterior to Scandinavia's cultural conversion in the eleventh century of the Christian Era; and this excellence had been one of the fruits of a previous Time-lag which the Scandinavian converts to a Western Christian culture had subsequently made good. The products of a Scandinavian Palaeolithic Age, Neolithic Age, and Bronze Age had been excellent because a laggardly Scandinavian craftsmanship had been wont to go on cultivating and perfecting imported techniques and *motifs* long after these had been abandoned in favour of some new-fangled device in the culturally precocious regions in which these *motifs* and techniques had originated.¹ To retain the cultural advantages of laggardliness while achieving the *tour de force* of catching up with precocious neighbours was beyond the wit of the Scandinavian or any other school of culture; and, over and above a cultural acceleration's inescapable penalty of cultural impoverishment, the Scandinavian Herodians also had to pay the further penalty of spiritual demoralization² which had likewise been the price of the Romans' forced march to catch up with the Greeks,³ and of the Vandals' forced march to catch up with the Romans.

After this glance at one instance of acceleration in the field of encounters between contemporaries, in which a long procession of Westernizing Herodians, extending from Hauk Erlendsson through Peter the Great to Mustafâ Kemâl, had succeeded, through forced marches, in catching up, at least on the surface of life, with the current Western culture of their day, we may turn next to the field of renaissances in which dead cultures had been brought back to life through being conjured up by living societies; and in this field we shall see that an acceleration of cultural tempo is part and parcel of the response to the challenge from the *revenant* which we have labelled 'the Antaeon rebound'.⁴

This lively reaction to the evocation of a ghost is evidence that the establishment of a psychic contact with the dead can be exhilarating; and this at first sight surprisingly stimulating emotional effect of so eerie an encounter is explained by the fact that the necromancer's communion with the dead gives him a chance of sharing in experiences which are still out of his reach in his own living world. This exciting possibility is opened up by the gruesome art of Necromancy because an experience that lies chronologically in the Past may be situate philosophically in the Future, in the sense of being something that the necromancer who has conjured it up out of a dead civilization's repertory has

¹ See II. ii. 342-3; III. iii. 138 and 157.

³ See IV. iv. 505-10.

² See II. ii. 357-60.

⁴ See pp. 140-8, above.

never yet experienced in his own life. If, for example, the *lacrimae rerum*¹ that Virgil has immortalized in his poetry have been distilled from the experience of an age of Hellenic history that is philosophically some five hundred years later than Dante's age in Western history, then, if Dante can succeed in entering into Virgil's thoughts and feelings, he will be anticipating a stage in the experience of his own living society that will not be reached there until, at earliest, the generation of Wordsworth, and perhaps not until a generation still unborn in A.D. 1952. This means that in psychic, as opposed to chronological, terms a Dante who has placed himself *en rapport* with a Virgil will be, not recoiling thirteen hundred years back into the Past, but shooting ahead five hundred years forward into the future. In other words, his feat of raising Virgil from the dead will have been a feat of cultural acceleration.

The most drastic of all known movements of cultural acceleration is the offspring of a mood of Futurism² in which the heirs of a disintegrating civilization reject their own cultural heritage in order to embrace an alien culture which attracts these purest of all revolutionaries to the extent to which it presents an antithesis to ancient cultural traditions when these have ceased to satisfy deep spiritual needs that insist on seeking satisfaction from some source or other. A classical example is the conversion of the Hellenic World during its universal state from its native cults of nature-worship, state-worship, and philosophy to incoming Oriental religions which now met with no serious rivals except one another for the allegiance of pagan Hellenic souls, and whose competition ended in the decisive victory of Christianity. This complete triumph of Christianity in the Hellenic World has a counterpart in the Sinic World in the partial triumph there of the Mahāyāna; and in both cases we find the spiritual revolution expressing itself visually in an aesthetic revolution that is no less thorough. In a dissolving Sinic Society the native Sinic art of the Han Age was rejected in favour of an Hellenic-Indic art that was the Mahāyāna's aesthetic vehicle. In a dissolving Hellenic Society the Hellenic style was rejected in favour of the Byzantine.

If the latter, at any rate, of these two aesthetic revolutions was, as it would seem to have been, a conscious and deliberate act,³ this would explain how it could happen that the four hundred years between Hadrian's and Justinian's day should have witnessed a change of style in the architecture of the Hellenic World that was incomparably more radical than any change that can be observed in the course of the six hundred years between Ictinus's day and Hadrian's.⁴ On the aesthetic plane, as on the military plane,⁵ Justinian's generation had deliberately taken the plunge out of a disintegrating Hellenic into a nascent Byzantine culture which the next generation was compelled to take on the economic and political planes willy-nilly by the deluge that descended after Justinian's death. This revolutionary breach of cultural continuity accounts for the striking acceleration in the rate of change in the style

of architecture that is recorded visually in the contrast between the *Ayia Sophia* and the *Olympieum*; and in this Helleno-Byzantine illustration of the rapidity of the pace of cultural change during the social interregnum intervening between the histories of an antecedent civilization and its successor we have the answer to H. R. Hall's conundrum; for in Egyptian history the interval between the end of the Twelfth Dynasty and the beginning of the Eighteenth Dynasty was likewise a social interregnum that can be recognized, on close inspection, as being the historical lesion that it is, in spite of the solidity with which a parted steel cable's frayed and flying ends have been posthumously spliced and welded together in the white heat of an explosion of cultural fanaticism.

In previous contexts¹ we have seen reasons for believing that, after the expiry of the mandate of a Middle Empire which had served as a disintegrating Egyptian Society's universal state, the disintegration-process was heading towards the dissolution of the time-expired civilization and the eventual emergence of a new society affiliated to it, when this normal course of events was arrested and reversed by the abnormal effects of a fanatical hatred that had been aroused in Egyptian souls by Hyksos barbarian invaders who had committed the, in Egyptian eyes, unpardonable offence of acquiring a tincture of an alien culture before setting foot on Egyptian soil. The consequent anti-Hyksos *union sacrée* between an Egyptian dominant minority and internal proletariat resulted in a resurrection of the Egyptian universal state in the shape of the New Empire and in the consequent substitution of an Epimethean epilogue to Egyptian history for the new civilization, distinct from the Egyptian though affiliated to it, that was showing signs of coming to birth when the normal course of historical development was given a peculiar twist in this Egyptian case. The social interregnum insulating a moribund Egyptian Civilization that refused to die from an embryonic affiliated civilization that was denied the opportunity of being born was to that extent abortive; yet the breach of cultural continuity at this point, which was afterwards so studiously patched up and plastered over by the hands of archaistic-minded Egyptian Zealots under the régime of a post-Hyksos restoration, was nevertheless sharp enough to account for the empirically verifiable fact that the two centuries between the end of the Twelfth Dynasty and the beginning of the Eighteenth Dynasty witnessed a notably greater change of style in Egyptian art than the immediately preceding two centuries during which the Twelfth Dynasty had been continuously in the saddle. So far from its being incredible that 'the changes observable during its [the Twelfth Dynasty's] continuance' should not be 'in any way comparable to those which had come about between its termination and the rise of the Eighteenth,'² it would be inexplicable if the second of these two periods of equal chronological length should not have witnessed a notably greater change of style than the first, considering that during the first the Egyptian Civilization was in its universal state, whereas the second period was occupied by one of

¹ See I. i. 136-45; IV. iv. 85, 412; V. v. 2-3, 152, and 351-3.

² H. R. Hall, quoted on pp. 350-1, above.

those social interregna in which the current of history perceptibly quickens its pace.¹

If we were challenged to find evidence for some general law governing the tempo of change in the realm of Life, the evidence that has proved irreconcilable with the hypothesis of invariability might perhaps lend itself more speciously to an hypothesis of secular acceleration.

In the history of Life on Earth, the Fauna had developed faster than the Flora; the vertebrates faster than the invertebrates; the mammals faster than the reptiles; Man through the transmission of a social heritage by means of education faster than the non-human animals through the transmission of a racial heritage by means of physical procreation;² Upper Palaeolithic Man faster than Lower Palaeolithic Man; and Man in Process of Civilization faster than a Primitive Man who had lapsed into a Yin-state in reaction from the Yang-effort of struggling up into becoming human. In a twentieth-century Westernizing World in which the pace of Man's intellectual and technological progress had been speeded up once again, and this time to an unprecedented degree, by a recent Western Industrial Revolution, it looked as if a crescendo that had been rising by geometrical progression, in a steeper and steeper curve, ever since Life's first epiphany, might now be on the point of culminating, in Human Life, in a pace at which men's racing thoughts and wills would no longer find themselves able either to coax or to drive their inseparable subconscious fellow-traveller in the depths of the Psyche to keep in the running; and the psychic catastrophe which this threat of psychic discord portended seemed at this stage to be not merely overtaking the surviving primitive societies and surviving non-Western civilizations that were being uprooted by the Western bulldozer's titanic impact; it now also appeared to be impending over the heads of the demonic Western chauffeurs of a potently mechanized Juggernaut's car.

'One of the phenomena that bring out, particularly clearly, the relation between the magnitude and pressure of the network of interdependence [linking together individual human beings in the Modern Western World] on the one hand and the psychic state of the individual on the other hand is what we call "the tempo" of our age. This [term] "tempo" is in reality nothing but an expression for indicating the multiplicity of the chains of the social network that find a node in every single social function and the pressure of the competition, emanating from this far-flung and densely populated net, that puts its "drive" into every single transaction.'³

We need not commit ourselves to the theory of a secular tendency towards acceleration in the march of Life which might seem at first sight

¹ See I. i. 43-44.

² See pp. 319-26, above. Julian Huxley points out that, in the jump from evolution on the inorganic level to Life, as well as in the subsequent jump from the transmission of a heritage by procreation to its transmission by education, 'the evolutionary process' had to pay for being 'much accelerated in time' by being 'immensely restricted in extent' (Huxley, J.: *Evolutionary Ethics*, the Romanes Lecture, 1943, reprinted in Huxley, T. H. and J.: *Evolution and Ethics*, 1893-1943 (London 1947, Pilot Press), pp. 120-1 and 123).

³ Elias, N.: *Über den Prozess der Zivilisation*, vol. ii: *Wandlungen der Gesellschaft: Entwurf zu einer Theorie der Zivilisation* (Basel 1939, Haus zum Falken), p. 337.

to be commended by the evidence that we have just been marshalling; for one manifestly weak point in the implicit argument is that the evidence, impressive though it looks when viewed *en gros*, does not cover, at the human climax of the story, more than the intellectual and technological sides of Man's nature and activity; and the formidably clear-cut picture of imminent and apparently inescapable disaster falls out of focus as soon as we begin to make it more true to real life by bringing Man's aesthetic and religious faculties and activities into the frame. The value of this specious hypothesis of a secular acceleration in the tempo of change lies, not in any intrinsic probability of its own, but in its testimony against the probability of the hypothesis that the tempo is invariable.

3. *Instances of Retardation*

Now that we have mustered these divers instances of acceleration in the tempo of cultural change, we shall not find it difficult to identify antithetical instances of retardation.

For example, the accelerations that declare themselves in revolutions within the family circle of a single society have their antithesis in the social enormities that are generated by a straggler's refusal to try to catch up with the progress of the main body.¹ A classical example of an enormity arising from a wilful retardation is the exacerbation of the Modern Western institution of Plantation Slavery in the Southern States of the American Union during the generation that elapsed between the peaceful abolition of Slavery throughout the British Empire in A.D. 1833 and its forcible abolition in the United States in A.D. 1863 at the cost of the Civil War of A.D. 1861-5.²

The acceleration that is demanded of marchmen when they are inducted into the life of more precocious communities in the interior, and into which the transfrontier barbarians are spurred at a hotter pace when they pour across a fallen *limes* into the derelict provinces of a universal state, has its antithesis in the retardation that is apt to be the price of migrating, in the opposite direction, from the heart of a society towards its extremities. Classical examples are the 'living museums'³ in which a seventeenth-century Normandy, Ulster, England, and Holland, and a sixteenth-century Castile and Portugal, were still to be found in a twentieth-century Quebec, Appalachia, Charleston, Transvaal, Peru, and Macao. The moral *bouleversement* that registers a barbarian invader's inability to accelerate the pace of his cultural adaptation to the almost prohibitively extreme degree demanded by the suddenness of his translation from an unreclaimed wilderness into a derelict paradise has its antithesis in a previous arrest of this adolescent's psychic development that has registered his frustration when he has found himself barred out by a military *limes* whose sudden creation at the moment of a universal state's establishment is as portentous an event in an external proletariat's experience as the sudden collapse of the *limes* when the universal state eventually breaks up.

³ See III. iii. 134-9.

that deliberately quickens its pace, in order to learn, before it is too late, how to keep an alien assailant at bay by fighting him with his own weapons, has its counterpart in a Zealotism that wilfully slows its pace down in the vain hope of thereby breaking off contact with a galloping adversary. In Jewry's reaction to the impact of Hellenism, classical examples of Zealotism are presented by the violent responses of the Maccabees and *sicarii* and the non-violent responses of the Pharisees, Scribes, and Rabbis;¹ and, in an Islamic Society's reaction to the impact of a Modern Western Civilization, the militant Maccabees and *sicarii* have their counterparts in the Wāhhābis, Sanūsīs, Idrīsīs, and Mahdists.² In the field of encounters in the Time-dimension an Antaeus rebound that wins from Necromancy an anticipatory communion with the Future has its antithesis in an Atlantean stance in which a Necromancer who has yielded to the legendary Epimethean impulse of Lot's wife is petrified by the hypnotic stare of a resuscitated corpse's Medusan countenance into the rigidity of a pillar of salt pinned down by the incubus of the Past. A classical example is the retardation of the Orthodox Christian and Far Eastern civilizations on the political plane through the resuscitation of the Roman Empire in the shape of the East Roman Empire in the one case, and of the Han Empire in the shape of the T'ang Empire in the other,³ and their retardation on the linguistic and literary plane through the resuscitation of the Hellenic and the Sinic Classics.⁴

The violent acceleration in the tempo of cultural change that is generated by Futurism when it repudiates a social heritage has its antithesis in a comparably extreme retardation that is induced by Archaism when it surrenders itself to the spell of the Past. We have already come across classical examples of this archaistic retardation on the linguistic and literary plane in the Neo-Attic and Neo-Sanskrit languages and literatures,⁵ and on the visual aesthetic plane in a Western Neo-Gothic architecture⁶ and in an Egyptiac revival, in the Age of the Twenty-sixth Dynasty, of the classic style of an Old Kingdom which had been obsolete for some two thousand years.⁷ A Saïte régime that recoiled that distance back into the past in its search for aesthetic inspiration was the penultimate avatar of an Egyptiac universal state which had refused to be content with a universal state's standard lease of life; and such tortoise-paced 'Tithoni',⁸ within whose creeping carapaces a senile body social continues to lead a lingering life-in-death, are enormities of the same genus as the 'fossils' of extinct civilizations exemplified in the Jews and the Parsees,⁹ and as the live but arrested civilizations exemplified in the Spartans and the Esquimaux.¹⁰ An arrest which had been the nemesis of superhuman previous exertions was perhaps the most dramatic instance of retardation in the histories of the civilizations up to date; and in the histories of the primitive societies this had its counterpart in Primitive Man's eventual lapse into a Yin-state that had been the nemesis of a social animal's previous *tour de force* of transmuting itself from Sub-Man into Man.

4. *Instances of an Alternating Rate of Change*

In our survey of evidences of variability in the tempo of change we have so far confined our attention to cases in which this variability has displayed itself in some single change of speed, whether upwards or downwards. Our survey would be incomplete if we did not also take account of cases in which there has been a concatenation of changes of speed in which the two antithetical movements of acceleration and retardation have alternated.

A conspicuous instance of an alternating change of speed is the rhythm of Withdrawal-and-Return which we have analysed in a previous Part.¹ The purpose, whether conscious or subconscious, of a potentially creative minority's temporary withdrawal from full participation in the contemporary common life of the society of which it is a member is to win for itself an opportunity of realizing its potentialities by forging ahead of the rank-and-file. Its disengagement from contact with its neighbours permits an acceleration of its own pace which it could never have achieved if it had been content to have its own pace set for it by the average pace of these pedestrian neighbours; and it is in the course of this individual spurt of acceleration that the minority succeeds or fails in bringing its creative potentialities to fruition. This, however, is not the end of the story; for, as we have seen, a creative minority's mission is to perform its work of creation, not just for itself, but for the benefit of the whole of the society to which it belongs. A creative withdrawal therefore will have missed fire if it is not followed by a redemptive return; and a re-entry into the ranks that the minority has temporarily deserted is necessarily accompanied by a retardation of its pace from the rate at which it has been travelling *in vacuo* to the slower rate at which it must now travel once more if it is to keep in step with neighbours whom it has to convert to the newly created idea or ideal or aptitude that it is bringing back with it from its lone reconnaissance. It will be seen that, on analysis, the movement of Withdrawal-and-Return turns out to follow a rhythm of three beats entailing two changes of speed, the first change upward and the second downward; and, as far as it is possible to portray a spiritual act in terms of the mechanical play of physical forces, we may compare the tripartite movement of a creative minority's withdrawal and return with the drill performed by the driver of a car when he changes gear by the threefold action of declutching, acceleration, and a re-engagement that reabates the momentarily free-running engine's racing speed by loading it once again with the retarding weight of the momentarily disengaged vehicle.

A concatenation of alternating changes of speed which runs, not just to two, but certainly to three and possibly to four, terms is to be found in the Modern Western history of the arts of shipbuilding and navigation. This story begins with a sudden acceleration which revolutionized both these arts in the West during the fifty years A.D. 1440-90; this spurt was followed by a technological retardation which persisted throughout the sixteenth, seventeenth, and eighteenth centuries; and

¹ In III. iii. 248-63.

this relatively long spell of comparative stagnation was then followed by another sudden acceleration which revolutionized the same arts once again during the fifty years A.D. 1840-90. In A.D. 1952 the next phase was still enigmatical because it was still in progress; but to a layman's eye it looked at this date as if the fresh technological advances achieved during the immediately preceding sixty years, remarkable though they might have seemed in any other historical context, might prove in retrospect not to compare in extent with the revolutionary achievements of a Victorian half-century. This series of alternating changes of pace in one sphere of technological activity in the history of one civilization is worth examining for the light that it may throw on the general question of the relation between Law and Freedom in History.

The key-notes of the fifteenth-century acceleration in the shipwright's and the navigator's art were its suddenness and its speed.

'In the fifteenth century . . . there was a swift and momentous change in the building of ships. It was a great era of architecture. In the space of fifty years the sea-going sailing-ship developed from a single-master into a three-master carrying five or six sails.'¹

And this technological revolution in the West not only gave its authors access to all quarters of the Globe by making them masters of Oceanic navigation; it also gave them an ascendancy over all non-Western mariners whom they encountered in any seas.²

'At the beginning of the fifteenth century the seaborne trade of Europe was carried in ships markedly inferior in design and workmanship to the vessels used in many parts of the East; but at the end of the sixteenth century the West European ships were the best in the World. They were, perhaps, less handy and less weatherly than the junks of the China seas, but in general, in their combination of seaworthiness, endurance, carrying capacity, and fighting power, they proved superior to anything else afloat.'³

This new-fangled Western type of vessel is the most characteristic emblem of a Modern Age of Western history (*currebat circa* A.D. 1475-1875) during which its unchallenged supremacy was proclaimed in its monopoly of the title 'ship', by which it came to be known *par excellence*. The 'ship's' distinctive virtue, in which it surpassed its successors as conspicuously as its predecessors, was its power to keep the sea for an almost unlimited length of time on end; and this virtue has been divined and lauded by a nineteenth-century Western man of letters who lived to see the 'ship' reach its peak of technical perfection, and all but lived on to see it disappear from the seas as suddenly as it had invaded them some four hundred years earlier.

'L'ancien navire de Christophe Colomb et de Ruyter est un des grands chefs-d'œuvre de l'homme. Il est inépuisable en force comme l'infini en

souffles, il emmagasine le vent dans sa voile, il est précis dans l'immense diffusion des vagues, il flotte et il règne.¹

This Modern Western ship was the offspring of a happy marriage between divers traditional builds and rigs, each of which had peculiar excellencies but also consequent limitations. The Western ship that was brought to birth between A.D. 1440 and A.D. 1490 was a felicitous harmonization of the strong points of an age-old Mediterranean oar-propelled 'long ship', *alias* galley, and a coeval Mediterranean square-rigged 'round-ship', *alias* 'carrack', with a lateen-rigged Indian-Ocean-faring 'caravel' whose forerunner is depicted in the visual records of an Egyptian maritime expedition to the East African land of Punt in the reign of the Empress Hatshepsut (*imperabat* 1486-1468 B.C.), and with a massively built Atlantic-Ocean-faring sailing-ship which caught Caesar's eye in 56 B.C. when he occupied the territory of the insurgent Veneti around the city that afterwards came to be known as Vannes in Brittany.² The fifteenth-century Western harmonization of these far-fetched elements was felicitous in the sense that their diverse excellencies were combined in a new pattern in which their respective limitations were transcended.

The carrack—which was introduced from Mediterranean into Atlantic waters, and was there blended with the local indigenous Ocean-faring type of craft, at the turn of the fourteenth and fifteenth centuries³—had the right rig to serve as the main equipment of ships of the large dimensions to which the coming West European Indiamen must run, because the carrack's square rig allowed the sail to be broken up into units of a manageable size, and therefore allowed the total spread of sail to be progressively increased by multiplying the number of these units.⁴ At the opening of the fifteenth century the standard Western square-rigged ship had only a single sail, since it had only a single mast, and this mast carried no top-sail.⁵ By the middle of the century the standard number of masts had risen from one to three in West European Atlantic waters;⁶ and, though the sixteenth-century addition of a fourth mast was discontinued in the seventeenth century and was not reintroduced until the nineteenth,⁷ the spread of sail was nevertheless increased by the alternative method of progressively raising the number of tiers of sail on each mast to six and by supplementing the regular sails with studding sails. This advantage of the square rig was, however, offset by the drawback that it gave the navigator no choice but to sail before the wind;⁸ and no doubt this was one reason why 'the square-rigged ship—the *nau*—played no considerable part in the early discoveries. The Portuguese preferred a borrowed alternative, the lateen caravel—a highly individual craft which betrayed Asiatic influence in its every line.'⁹

⁹ *Ibid.*, p. 22.

The lateen sail had been invented in the Indian Ocean; and lateen caravels had been introduced into the Mediterranean by the Muslims and had been borrowed by the Portuguese from them.¹ In Prince Henry the Navigator's annual southward voyages of discovery down the Atlantic coast of Africa, which had begun in A.D. 1421, if not before,² caravels were 'first used in 1440, to judge by Azurara'.³ The virtue of the lateen rig was that it enabled the navigator to beat to windward;⁴ but in this rig there were two drawbacks to set against the advantage. One was that in a lateen-rigged vessel it was difficult to 'go about'—a manœuvre that might be seldom necessary in monsoon navigation, but that became a matter of serious concern when the lateen rig was introduced from the Indian Ocean into other waters.⁵ The other drawback of the lateen rig was that the size and weight of lateen spars were so great in proportion to the size of the sail which they could carry, by comparison with the sail-carrying capacity of the square rig, that this defect of the lateen rig set limits to the maximum spread of canvas, and therefore to the maximum size of the vessel thus equipped.⁶

Out of these two piquantly diverse types of vessel, the Portuguese and Spanish shipwrights succeeded, before the end of the fifteenth century, in creating a new composite type with a mixed rig, the *caravela redonda*.⁷ This was a three-masted vessel of barquentine rig, in the sense that it carried square sails on the fore-mast and lateen (not, of course, yet fore-and-aft) sails on the main-mast and the mizen-mast.⁸ By an early date in the sixteenth century this type—with the main-mast as well as the fore-mast now square-rigged—had become the standard type throughout Western Christendom;⁹ and, though the vessels used by Vasco da Gama are recorded to have been, not *caravelas redondas*, but *naus*,¹⁰ we may presume that these late-fifteenth-century 'ships' resembled the late-fifteenth-century caravels in having a mixed rig, even if they differed from them in being of heavier tonnage¹¹ and clumsier build. In the course of the sixteenth century this clumsiness was fined down in the build of the galleon, which was a carrack with a *caravela redonda*'s mixed rig and with a Mediterranean galley's slim lines.¹² By A.D. 1485 the navigators of this full-blown Modern Western 'ship' had equipped themselves for finding their way over the high seas by mastering the art—invented by Arab navigators in the Indian Ocean—of reckoning their latitude by the co-ordinated use of the quadrant and a set of astronomical tables.¹³ By the opening of the sixteenth century they had equipped them-

selves for holding their own against any human adversaries *en voyage* by the invention of opening up gun ports between-decks.¹

'What is so remarkable about these ships is their wonderful development. They do not stand so very far distant in point of general structure and rig from the ships of Nelson's day;²

and, by the same token, what is so remarkable about the half-century of acceleration in the Western arts of shipbuilding and navigation *circa* A.D. 1440-90 is that it was followed by three centuries of hardly less conspicuous retardation.

'[The] smug complacency [of the majority of British shipowners at the time of the revision of the Navigation Acts in A.D. 1845] had devastating effects on the shipbuilding industry itself, as well as disclosing an inertia that was out of step with the changing times; for we were passing, as a nation, out of an agrarian order into an industrial one, which made far greater demands on transport. How much progress had been made in naval architecture in the past two centuries? Certainly there had been many innovations and important improvements in the construction and the rig.³ Labour-saving appliances, too, had been invented. But, if we confine ourselves to essentials, especially in respect of the hull, the progress is almost negligible. After all, there was little incentive towards better ship-design while there was little competition. . . .

'Builders were content to pursue the well-tried methods, and there is small evidence of creative originality. The Dumer's draughts of ship-plans for 1680 . . . show a method of ship-building which does not differ very appreciably from that employed a century later. The standard work on the architecture of the wooden ship was written by Frederick Hendrick Chapman, who became Chief Constructor and Admiral Superintendent of the Swedish Naval Dockyard at Karlskrona. This great designer, born in 1721, came of an old English family from Deptford, from whom he inherited his skill and enthusiasm for naval architecture. His *Architectura Navalis Mercatoria* and his *Treatise on Shipbuilding*, an amplification of the former work published in 1775, were freely quoted from in the official report of the Chatham Committee of Naval Architects of 1842-44.⁴ There could be no more conclusive evidence than this of the "mark-time" in shipbuilding and ship-design. . . .

'The ordinary standard of merchant ships was not creditable. They were slow, unhandy, ill-equipped, and inferior in workmanship. Can one say they reflect two centuries of progress? Ship-design, like a spinning-top, rotated on a point. The opening of the nineteenth century saw no

¹ See Parry, *op. cit.*, pp. 27-28; Bowen, *op. cit.*, p. 14.

² Bassett-Lowke, J. W., and Holland, G.: *Ships and Men* (London 1946, Harrap), p. 48.

³ 'The main innovation in the course of the three hundred years A.D. 1500-1800 had been the Dutch invention of the fore-and-aft rig, which was 'an immense advance upon the lateen for beating to windward'. In the non-square-rig part of the rig of big ships (as distinct from the small craft in which the fore-and-aft rig had been first developed), fore-and-aft sails were substituted for lateen sails by the Dutch towards the end of the seventeenth century (Parry, *op. cit.*, pp. 133-4). 'The late seventeenth and early eighteenth centuries saw great improvements in the rig of sea-going ships, notably the introduction of fore-and-aft headsails working on the stays, and a little later the transformation of the cumbersome lateen mizen into the fore-and-aft "spanker"' (*ibid.*, p. 186).—A.J.T.

⁴ 'Vessels were built to the patterns laid down under the Stuarts right down to the death of George III, even to the start of Victoria's reign' (Abell, W.: *The Shipwright's Trade* (Cambridge 1948, University Press), p. 102).—A.J.T.

lively effort to improve ship-design, nor any of that competitive enterprise that marked the race of the factory-owners for business.¹

Thus, at a date some four hundred years after the opening of the half-century, bestriding the transition from a Medieval to an Early Modern Age, that had witnessed a revolution in the build and rig of Western ships, it might have looked in retrospect as if a fifteenth-century burst of acceleration in the tempo of Western marine technology, which had given the West a subsequent Ocean-wide ascendancy, had been a unique bout of creativity in the long annals of a Western maritime practice that had been almost as stagnant during the Modern sequel to this short-lived golden age as it had been during the Medieval prelude to it. Yet at this very date the Western art of shipbuilding was actually on the eve of another burst of acceleration that was to produce as great a revolution as its predecessor; and this time the work of creation at high speed was to go forward along two parallel lines. On the one hand, artificially generated mechanical power was to be substituted for wind-power as the driving force by which ships were to be propelled; and contemporaneously, in response to the same challenge that had thus evoked the application of steam-power to navigation, the art of building the classic Modern Western sailing-ship was to awake from its long slumber in order to carry an old type to a new and previously undreamed-of degree of perfection at which, for some of the purposes of maritime traffic, the sailing-ship was to hold its own against the steamship throughout the doubly creative half-century A.D. 1840-90.

The new-fangled type of vessel that was to acquire its classic form in the course of the half-century beginning in A.D. 1840 had by that year only just emerged from the pioneer experimental stage of its development. Though William Symington's steamship *Charlotte Dundas* had plied on the Forth and the Clyde as early as A.D. 1802,² and the Atlantic had been crossed by steam-power reinforced with sail-power in A.D. 1819³ and by unaided steam-power in A.D. 1827,⁴ the era of mechanical navigation as 'a practical proposition' did not open earlier than the triennium A.D. 1838-40, which saw the launching of the first screw-propelled vessel, the *Archimedes*,⁵ in A.D. 1838, the successive establishment of the Cunard, the Royal Mail, and the Peninsular and Oriental steamship navigation lines (the first two of the three in A.D. 1839 and the third in A.D. 1840),⁶ and the crossing of the Atlantic under steam in A.D. 1838 by the *Sirius* and the *Great Western*, and in A.D. 1840 by a *Britannia* that was the first Cunarder to make the passage.⁷

'The power-ship opens a new era in water-transport. She is not evolutionary but revolutionary, for she represents a complete break with tradition. Any compromise with the sailing-ship works to her disadvantage both in efficiency and aesthetically. . . . Not till conservative tradition had been scrapped could the power-ship evolve in accordance with her own needs. For the power-ship is modern, different, and original. Her life is not in the

sails but [in] the engine-room. Her natural home is the port rather than the sea. She is tied to her fuel supplies and crosses the oceans sailing to a time-table. Her officers are composed of scientists and technicians, specialists confined to special departments—deck or engine-room—and her crews have specialised duties. The engine-room staff is proportionately bigger than the deck-staff, which grows less and less numerous.¹

The conquest of the Ocean by this new-fangled mechanically driven type of vessel in the course of the fifty years A.D. 1840–90 was indeed as great and rapid a revolution as the previous triumph of the Modern Western Ocean-faring sailing-ship some four hundred years earlier; but the distinctive virtue of the steamship, like the qualities of the carrack and the caravel, was offset by consequent limitations. In the act of liberating navigation from its age-long servitude to the vagaries of the winds, the revolutionary new invention of mechanical propulsion re-tethered *Homo Navigans* to the land, of which he had been virtually independent ever since he had substituted the sail for the oar. The steamship dispensed with wind-power at the price of tying itself to coaling-stations; and, however short the intervals at which she might reluctantly consent to break her voyage in order to refuel, she would still be constrained to convert commercially valuable cargo-space into bunker-space which was as unprofitable as the rowing-space which the invention of the sailing-ship had long since enabled the merchantman to eliminate. A high consumption of coal for each effective unit of coal-generated steam power had to be paid for in a reduction of cargo-space and in a shortening of the maximum possible length of unbroken voyage that made the archaic steamship's performance uneconomic by comparison with the classic sailing-ship's.

In mechanically propelled vessels using coal for fuel the solution of this problem had to wait for the invention of the compound engine, which was first installed in the Holt Line S.S. *Cleator* in A.D. 1863, and which in A.D. 1865 enabled the Holt Line S.S. *Agamemnon* to make a non-stop run of 8,500 miles from Liverpool to Mauritius.² Even after this triumph of marine engineering, auxiliary sail, which had been the steamship designer's earliest expedient for keeping down the rate of coal consumption, was rigged in the Cunard S.S. *Umbria* as late as A.D. 1884;³ and sailing-ships which avoided the steamship's handicaps by continuing to rely on wind-power alone earned the highest profits in their commercial history during those mid-nineteenth-century decades in which the technique of steam-propulsion was still feeling its way towards full efficiency.⁴ The sailing-ship's nineteenth-century *tour de force* of keeping in the running with her new mechanically propelled rival could hardly have been achieved, however, if, during the same fifty years A.D. 1840–90, that saw the steamship's crucial problems solved, the sleeping art of sailing-ship construction had not bestirred itself out of a three-hundred-years-long stagnation in order to enter on a fresh spurt of creativity. In tempo and in quality alike, the improvements made in the Modern Western sailing-ship in that half century could bear com-

parison with the contemporary progress that was being made in the outlandish mechanism of the new-fangled steamship,¹ and perhaps even with the fifteenth-century revolution in marine technology which had brought the Modern Western sailing-ship herself into being.

The designers of the 'clipper' ship in the eighteen-thirties and eighteen-forties abandoned the late-seventeenth-century models which their predecessors had been lazily copying for the last 150 years in order to introduce revolutionary changes of build which gave a higher speed to a sailing-ship of more than twice the previous standard tonnage;² and they were also no less alert than the architects of the steamship in turning an Industrial Revolution to account. The use of iron as a material for shipbuilding, which was introduced in A.D. 1829,³ made it possible to reduce the weight of the hull by 35 per cent.⁴ A composite construction, part iron and part wood, was employed for sailing-ships from A.D. 1851 to A.D. 1870 or thereabouts.⁵ The first sailing-ships constructed wholly of iron were built for the Australia wool trade.⁶ The year A.D. 1851 saw the first use of ropes made of wire instead of hemp,⁷ and the early eighteen-eighties the first use of steel tubing instead of timber for masts and lower yards.⁸ Circa A.D. 1884 the substitution of mild steel for iron as the material for the construction of large sailing-ships made possible a further reduction of weight—by 15 per cent., this time.⁹ In and after A.D. 1887 donkey engines, driven by steam, were installed on sailing-ships to save man-power, and, with the same end in view, all tiers of sails above the top-gallants were then cut out.¹⁰

Though the overcoming of the steamship's original limitations through the successful experiment with the compound engine in A.D. 1863–5 had spelled a rejuvenated sailing-ship's eventual doom, the Modern Western sailing-ship actually attained its acme at a time when it was thus already under sentence of death at the hands of a now irresistible competitor. Just as the coaches and the canals had been brought to their highest point of efficiency in Great Britain on the eve of their being put out of action by the railways, and a Medieval Western Latin poetry had reached its zenith throughout Western Christendom on the eve of its being silenced by the voice of the vernacular tongues, so the Modern Western sailing-

¹ According to Schumpeter, J. A.: *Business Cycles* (New York 1939, McGraw-Hill, 2 vols.), vol. 1, pp. 369–70, the innovations in the construction of Western sailing-ships from circa A.D. 1840 onwards were partly evoked by the new challenge presented to the sailing-ship by the steamship's epiphany.

² The new move in sailing-ship design which produced the 'clipper' started in the shipbuilding yards at Baltimore, and it seems to be a moot point whether the *Ann McKim*, launched there in A.D. 1832, or the *Scottish Maid*, launched in A.D. 1839, was the first ship that could fairly claim the new title (see Bowen, op. cit., p. 58). Ships on the lines of the Baltimore clippers, but with a tonnage of over 750 tons, began to take the sea from American yards in and after A.D. 1843 (see Clowes, op. cit., p. 103). The development of the new breed of sailing-ship was given an impetus by the discovery of gold in California in A.D. 1849, since at this date the cheapest and surest route thither from the Atlantic seaboard of North America was by sea round Cape Horn. The average tonnage of a clipper then rose from 1,000 tons to 2,000 tons plus or minus (Bassett-Lowke and Holland, op. cit., pp. 145–6).

³ According to Bassett-Lowke and Holland, op. cit., p. 168, the first iron ship was built as early as A.D. 1821.

ship sang its swan song during the quarter of a century A.D. 1865-90, bestriding the transition from a Modern to a post-Modern Age of Western history, when it was on the point of being driven off the seas by the steamship. The tonnage of the sail-borne British merchant marine reached its peak in A.D. 1875.¹ The historic race between tea clippers from Foochow to London was run in A.D. 1866;² the historic race between wool clippers from Australia to London in A.D. 1887-8.³ The *Thermopylae* was launched in A.D. 1868; the *Cutty Sark*—a composite-built ship with a tonnage of 2,100 tons—in A.D. 1869.⁴ The largest sailing-ship ever launched—the *Preussen*, with a length of over 400 feet and a tonnage of over 5,000 tons gross—was built at Geestemünde, near Bremen, after the turn of the century, in A.D. 1902.⁵

The writer of this Study had the good fortune, as a child, to catch a last glimpse of the sailing-ship before she vanished from the seas, and to be initiated into the lore of her divers rigs by the former master of an East Indiaman, his great-uncle Captain Henry Toynbee (*vivebat* A.D. 1819-1909),⁶ who had retired from the sea in A.D. 1866 without ever having seen service on a steamship or indeed on any build of sailing-vessel other than a full ship since his first voyage at a tender age on a barque. On summer holidays in the eighteen-nineties at St. Margaret's Bay on the English shore of the Straits of Dover, under the eye of the South Foreland lighthouse, the small boy learnt the rigs from the old sailor as the ships came gliding past: schooners and three-masted schooners and top-sail schooners (very common); brigantines and brigs (rather rare); barquentines and barques; and full-rigged ships ranging from classic three-masters to the four-masters and five-masters that were a nineteenth-century revival of a sixteenth-century fashion. He learnt to know and love them all, without ever suspecting that he would live to see the disappearance of this divine work of Man's hands which, in his uncle's confident eyes, was as much a part of the eternal order of Nature as the chalk cliff on which they were standing, or as the water which gave the measure of the distance from the shore to the passing ship. In the eighteen-nineties the sailing-ships plying through the Straits were still far more numerous than the steamships (though doubtless steam had by then long since outstripped sail in aggregate tonnage). As late as the summer of 1910, there used always to be several four-masted sailing-ships at anchor in Falmouth harbour, and in the summer of 1911 the wreck of one huge sailing-ship was lying huddled against

⁶ 'Captain Henry Toynbee was one of the most scientific navigators of his day. . . . "He was always sure of his longitude within five miles," writes one of his officers. And his wonderful landfalls were the admiration of his passengers.

'Toynbee . . . went to sea in 1833 at the age of fourteen as a midshipman in the East Indiaman *Dunvegan Castle*. . . . Toynbee's first command was the *Thermopylae*. . . . He had also commanded the *Gloriana* and *Marlborough* before he took command of which he resigned in 1866 in order to succeed Admiral . . . Superintendent of the Meteorological Office. He retired in 1888, and lived to be over ninety years of age, an example of all that an officer in our mercantile marine should be (Lubbock, Basil: *The Blackwall Frigates*, 2nd edition (Glasgow 1950, Brown, Son, & Ferguson), pp. 145-6).

the cliffs between the South Foreland and Dover. Yet, already, forty years back, sail was being driven by steam off one sea-route after another. The China tea clippers had been put out of business by the opening of the Suez Canal in A.D. 1869,¹ which had deprived them of their advantage over steamships trying to compete with them on the long voyage round the Cape; by A.D. 1875 all routes except the Australian had been captured by steamships;² and in A.D. 1881 the Australian route itself was conquered for steam by the S.S. *Aberdeen* with her triple expansion engines,³ though the wool clippers went on fighting their losing battle till the end of the decade.⁴ The interval between the first two world wars saw the process of extinguishing the sailing-ship completed.⁵

If a lay observer's eye is not mistaken, the close of the ninth decade of the nineteenth century, which marked the virtual end of a fifty-years-long struggle between a rejuvenated sailing-ship and a new-fangled steamship, also marked the end of the spurt of creative activity which the shipwright's art had been making during those same fifty years in both these competing lines. While the standard battleship and merchantship of A.D. 1890 had no more recognizable affinity with those of A.D. 1840 than a basilisk has with an angel fish, the standard battleship and merchantship of A.D. 1950 bore as close a resemblance to those of A.D. 1890 as the standard battleship and merchantship of A.D. 1840 had borne to those of A.D. 1640. No doubt the sixty years A.D. 1890-1950 had also brought with them further innovations and improvements. The introduction of turbine engines driven by steam generated by burning oil instead of coal had been a change of perhaps the same order of magnitude as the substitution of fore-and-aft sails for lateen sails in the Modern Western ship at the turn of the seventeenth and eighteenth centuries,⁶ while the invention of radio-telegraphy and the installation of the apparatus on board ship just after the end of the First World War, and the invention of radar and its installation after the Second World War, were perhaps as great landmarks in the history of the Western art of navigation as the eighteenth-century solution of the problem of calculating longitudes through the perfecting of the chronometer.⁷ Yet, however notable these changes might be in themselves, they looked insignificant by comparison with the swiftness and greatness of the revolution that had been accomplished between A.D. 1840 and A.D. 1890. To a lay observer born in A.D. 1889 and looking back in the year 1952, it seemed clear that his own lifetime had been, in the history of shipbuilding, a period of retardation in the tempo of change by comparison with the pace of the forced march during the immediately preceding half century.

If this impression was correct, then a series of alternating accelerations and retardations which had begun with the acceleration *circa* A.D.

1440 had run through a first retardation into a second acceleration and thence into a second retardation in the course of some five centuries.

This glance at the history of the Western shipwright's art concludes our survey of evidences of variability in the rate of social change; and these evidences—which have presented themselves in divers phases of the histories of a number of different civilizations—are so many indications that a recalcitrance to laws of Nature is no less characteristic of Human Nature than an amenability to them. Indeed, if we now look again at the pattern of the disintegration-process, in which we have found our classic example of regularity, we shall see that a varying rate of change is one of this regular process's uniformly recurring features. There is a particularly sudden and extreme change of tempo at the transition from a Time of Troubles to a universal state; for the second paroxysm of a Time of Troubles, which is precipitated by the first relapse and is pulled up short by the second rally, is the most feverishly fast-moving episode in the story, whereas there is no episode in it so slow-moving as the first spell of oecumenical peace which supervenes. This rebellious variability in the rate of change is not, however, the only irregularity in the gait of History which suggests that, after all, Man may not be completely subject to Nature's orders.

(b) THE DIVERSITY OF CORRESPONDING EPISODES IN THE HISTORIES OF DIFFERENT CIVILIZATIONS

1. *A Diversity in the Duration of the Growth-Phases of Civilizations*

Evidences of human recalcitrance to laws of Nature multiply when we place the records of the life-histories of civilizations side by side and take a synoptic view of them. Two breaches of uniformity that stand out conspicuously are a quantitative diversity in the duration of the growth-phases of those civilizations whose growth-spans we are able to measure, and a no less striking qualitative diversity in the relations of Religion to the rises and falls of civilizations in different generations.¹

The diversity in the length of measurable growth-spans is extreme, as can be seen by anyone who runs his eye down Table V at the end of the present volume.

In compiling this table we have had to leave out of account the seven civilizations of the first generation (the Egyptiac, Sumeric, Minoan, Indus Culture, Shang Culture, Andean, and Mayan), since each of these arose out of the mutation of some primitive society² at a stage of social development earlier than the invention of techniques for keeping records; and, though we may know, or guess, the nature of the challenges from Physical Nature by which these mutations were evolved,³ we have no means of even approximately estimating the dates at which they occurred. In the history of the Egyptiac Civilization, for example, the evidence, as it stood in A.D. 1952, did not suffice to indicate whether the age of 'the Old Kingdom' was to be equated with the growth-phase of the Egyptiac Society, or whether an investigator was to see here a uni-

¹ See Table IV: Primitive Societies, Civilizations, Higher Religions, in vol. vii, *ad fin.*

² See II. i. 188.

³ See II. i. 302-30.

versal state representing the last phase in the disintegration of a society whose antecedent Time of Troubles, breakdown, and growth-phase were still buried in oblivion.¹ In our present search for approximately ascertainable measurements of growth-spans, our field is therefore limited to the group of 'affiliated' civilizations; and in A.D. 1952 there were seven-teen known specimens of these (reckoning the Sinic Civilization as one, now that the progress of archaeological discovery had deprived it of its title to rank as a primary civilization by bringing its Shang predecessor to light).

The epiphany of an 'affiliated' civilization ought to be less difficult to date, since we may expect to see it emerge out of an interregnum following the break-up of a universal state representing the last phase in the history of an antecedent civilization. There were, nevertheless, at least three 'affiliated' civilizations—the Yucatec, Mexic, and Sinic—whose epiphanies were almost as difficult to date as those of the primary civilizations in the dim and flickering light of the archaeological evidence at the disposal of an historian mid-way through the twentieth century of the Christian Era. In their pioneer attempts to link the Mayan Society's impressively exact, but self-contained and insulated, chronological records with the post-Amosan chronology of the Old World, Modern Western scholars had divided into two schools whose respective datings differed by no less than a quarter of a millennium; and this discrepancy was reflected in a corresponding uncertainty about the chronology of the growth-phases of the affiliated Yucatec and Mexic civilizations. As for the dating of the epiphany of the Sinic Civilization, Western scholars were confronted here with a discrepancy within the Sinic tradition itself, in which, for the period before the year 841 B.C., the standard chronology was challenged by the testimony of the so-called 'Bamboo Books'.² These two conflicting Sinic chronologies were as much as seventy-two years apart in their dating of the overthrow of the Shang Power by the Chóu invader Wu Wang; and, even if we were to opt in favour of the Bamboo Books' date 1050 B.C. against the standard chronology's date 1122 B.C., we might still find ourselves uncertain how to interpret this event in terms of the replacement of an antecedent Shang Society by an affiliated Sinic. Was the Shang Power whose latest capital at Mo the archaeologists had disinterred³ since the publication of the first three volumes of the present Study in A.D. 1934 a universal state in the sense in which we have been using the term? And was the Chóu Power that replaced the Shang Power a semi-barbarian successor-state like the Achaean Power that asserted itself at Mycenae after the sack of Cnossos, or the Ostrogoth Power that established itself at Ravenna after the collapse of the Roman Imperial Government's rule over the Roman Empire's western provinces? These moot points of historical interpretation conspired with the discrepancy between conflicting chronological systems to baffle an historian seeking in A.D. 1952 to date the Sinic Civilization's epiphany.

¹ See pp. 682-92, below.

² See Hirth, F.: *The Ancient History of China* (New York 1908, Columbia University Press), p. 176.

³ See VI. vii. 213, n. 1.

Moreover, there was at least one 'affiliated' civilization—the Western—whose epiphany could be dated but whose growth-span nevertheless could not be measured in A.D. 1952 because at that date it was still impossible to tell whether this civilization had or had not yet broken down.¹

Subject to these still unclarified uncertainties, it was possible in A.D. 1952 to draw up the accompanying table² of the approximate Time-spans of the growth of the 'affiliated' civilizations in a descending order of duration.

In this table there are, no doubt, certain traces of regularity. For example, apart from the two extremes represented by the Western Civilization and the Mexic Civilization respectively, the Time-spans appear to fall into five groups: one of about 600 to 700 years length (in four instances); one of about 400 years (in three instances); one of about 300 years (in two instances); one of about 175 to 200 years (in four instances); and one of about 100 years (in two instances). It also seems unlikely to be merely an accident that two civilizations so closely resembling one another in their structure as the Hellenic Civilization and the Medieval Western city-state cosmos should have an identical Time-span. Such appearances of regularity, however, are insignificant by comparison with the magnitude of the differences in a spread of Time-spans ranging in length from 850 years or more to zero; and some of the greatest of these chronological differences are to be found between the respective spans of twin societies that are affiliated to the same predecessor and are coeval in their epiphanies. The Hellenic Society's growth-span of some 700 years presents as great a contrast to the twin Syriac Society's span of some 200 years as the Western Society's span of 875 years or more presents to the twin Orthodox Christian Society's span of some 300 years.

2. *A Diversity in the Relations of Religion to the Rises and Falls of Civilizations in Different Generations*

In a previous context³ we have observed that every social interregnum between civilizations of different generations that had occurred in the history of this species of society up to date had been marked by flashes of religious light; but we have also observed that these successive flashes had been strikingly unequal in the degree of their luminosity. The higher religions which had made their epiphany during the falls of the secondary civilizations had brought into the world a spiritual illumination which seemed beyond compare with the fainter light cast either by the rudimentary higher religions that had appeared during the falls of the primary civilizations or by the secondary higher religions that had been appearing during the falls of the tertiary civilizations.⁴ This difference in degree of spiritual power was so great that it amounted to a difference in kind and quality; and there could be no clearer intimation than this that the rotation of the sorrowful wheel of Human Life on

¹ See XII, *passim*, below.

² Table V at the end of the present volume.

³ In VII. vii. 420-5.

⁴ See Table IV in vol. vii, *ad fin.*

Earth was something more than one of those vain repetitions of the Heathen¹ through which Man is convicted of being in penal servitude to laws of Nature.

(II) POSSIBLE EXPLANATIONS OF THE INOPERATIVENESS OF LAWS OF NATURE IN SOME PHASES OF HUMAN AFFAIRS

Now that we have encountered some phases in which human affairs have all the appearance of being recalcitrant to laws of Nature, we shall find ourselves looking for possible explanations of a partial inoperativeness of these laws in the field of Human Life, where we have previously found impressive evidences of their currency. Divers alternative possibilities suggest themselves. This appearance of recalcitrance might be merely an illusion, due to ignorance, which would be dispelled if we were precisely informed of all the relevant facts. Or, supposing that an advance in our knowledge had made it certain that this appearance was a faithful reflection of Reality, then a genuine recalcitrance of human affairs to laws of Nature might perhaps be explicable as being either an effect of the play of Chance or a product of creative responses to challenges. Let us look further into each of these three possibilities.

The interpretation of the appearances of freedom in Human Life as mere mirages induced by sheer ignorance was one possible explanation that a twentieth-century Western inquirer was not entitled to rule out, since in that age a post-Modern Western intellect was only on the verge of discovering laws of Nature reigning in the Human Psyche's subconscious abyss, while at the same date the actual quantity of recorded statistical evidence bearing upon laws of Nature in the affairs of Man in Process of Civilization was still minute by comparison with the potential quantity of the evidence in the same field that might accumulate in the future.

The number of civilizations that were known to have existed up to date—leaving out of the reckoning those that had been abortive or had been arrested—amounted to no more than twenty-one, and these represented no more than three generations, so far, spread over no more than five or six thousand years, reckoning from the probable era of the species' epiphany down to the time of writing. In previous contexts² we have observed that, if we were to reckon the duration of the Age of the Civilizations up to date at the maximum figure of 6,000 years and were to halve the figure of 1,000,000 million years at which twentieth-century Western scientists had estimated the Human Race's present expectation of life on its native planet (always supposing that the race did not exterminate itself long before reaching the end of Nature's rope), there would be time during these next 500,000 million years for no less than 1,743,000,000 further civilizations to come and go if they were to continue to come and go at the same rate as during the first 6,000 years of the history of this species of Society. For an historian this was an in-

¹ Matt. vi. 7.

² In I. i. 456-64 and VII. vii. 453-4, and on p. 344, above.

timidating calculation, notwithstanding the evidence indicating that the tempo of social change was by no means uniform as a matter of fact. Within the writer's own infinitesimally short experience between the time when he was drafting his first systematic notes for this Study in A.D. 1927-9 and the time in A.D. 1950 when he was approaching the completion of the writing of the text, previously unknown facts had been brought to light—for example, in the realm of pre-Sinic archaeology and in the realm of Sumeric chronology—which were no mere points of detail but were 'integral' facts throwing fresh light on the whole study of History. The spectre of ignorance haunted the writer at the close of his work as insistently as at the beginning; and it was always in his mind that future students of History, equipped with vastly ampler funds of relevant knowledge, might smile at his faith in a pittance of knowledge that, by comparison with what they knew, would look as tiny as a squirrel's winter store. A faith that had moved him to carry out his own reconnaissance did not blind him to the possibility—improbable though he personally felt this to be—that the appearance of freedom in human affairs might be dissipated one day by a progressive increase in the candle-power of Science's dry light.

If a haze of Ignorance was thus one of the contingencies that had to be reckoned with, was it also necessary to allow for the play of Chance? The answer to this second question could be given out of hand, without any question here of having to await the verdict of a still untold tale of 500,000 million years; for the settling of the historian's accounts with Chance was a matter, not of fact-finding, but of reasoning; and Reason pronounces that Chance is not an absolute positive concept, but a negative and therefore necessarily a relative one, and that accordingly to see in Chance an ultimate explanation of any phenomenon would be as naïve an error as to mistake a sign-post for the goal to which it pointed. Just as the label 'Heterodoxy' merely indicates the existence of another 'doxy' labelled 'Orthodoxy',¹ and the name 'Neustria' merely indicates the existence of another country labelled 'Austrasia',² so the labelling of a phenomenon as an outcome of the play of Chance merely indicates that this phenomenon does not display the pattern of some particular kind of order that the thinker happens to have in mind—and perhaps also to expect, or even desire, to find—at the moment when he indicates its absence in the case in point by holding Chance responsible for the production of the phenomenon that has to be accounted for. To attribute a child's paternity to Chance is thus merely a form of words for stating that this child cannot be credited with some other paternity that might have been expected to be proved; but this negative label does not tell us what the child's true paternity is; nor can this or any other verbiage act as a spell to perform the miracle of begetting a child without recourse to any father at all. The patronymic 'child of Chance' merely informs us that the foundling is not the child of so-and-so; and this negative finding

¹ A theologian with a sense of humour who was asked by a lady at a dinner party to explain the difference between Orthodoxy and Heterodoxy is said to have answered her: 'Well, Orthodoxy is *my* doxy and Heterodoxy is *your* doxy.'

² See II. ii. 167, n. 2.

leaves us just where we were; for it leaves still unanswered our original question asking who the child's true father is.

All nature is but art, unknown to thee;
All chance, direction which thou canst not see.¹

This relativity, and consequent inconclusiveness, of the concept of Chance has come to our attention already in this Study in other contexts;² and, in order to make sure, once again, of making this logical point clear, we will quote, once again, a French philosopher's lucid exposition of it.

'If, at a venture, I select a volume in my library, I may replace it on the shelves, after taking a glance at it, with the remark "This isn't verse". But is this really what I perceived when I was turning the pages? Clearly not. I did not see, and I never shall see, an absence of verse. What I did see was prose. But, as it is poetry that I am wanting, I express what I find in terms of what I am looking for; and, instead of saying "Here is some prose", I say "This isn't verse". Inversely, if it takes my fancy to read some prose and I stumble on a volume of verse, I shall exclaim "This isn't prose"; and in using these words I shall be translating the data of my perception, which shows me verse, into the language of my expectation and my interest, which are set upon the idea of prose and therefore will not hear of anything else. . . .

'An order is contingent, and appears so to us, in relation to the inverse order, in the way in which verse is contingent in relation to prose, and prose in relation to verse. . . . If we analyse the idea of Chance, which is a near relation to the idea of Disorder, we shall find the same elements. When the purely mechanical operation of the causes which bring the roulette to a halt on a particular number makes me win and so behaves as a good genius would have behaved if he had been looking after my interests, and when the purely mechanical force of the wind snatches a tile from the roof and flings it down on my head—thus acting as an evil genius would have acted if he had been plotting against my life—in both cases I find a mechanism in a place where I would have looked for—and ought, it would seem, to have encountered—an intention; and that is what I am expressing when I speak of "Chance". And in describing an anarchic world, where the phenomena follow one another at the pleasure of their caprice, I shall say, again, that this is the reign of "Chance", and I shall mean by this that I find myself confronted by acts of will, or rather by "decrees", when what I was looking for was mechanism. . . . The idea of "Chance" simply objectifies the state of mind of someone whose expectation has been directed towards one of two species of order and who then encounters the other. Chance and Disorder are, then, necessarily conceived of as relative.'³

In another context⁴ we have noticed already that this mirage of 'Chance' and 'Disorder', even when it has been conjured up out of the emotional underworld of the Psyche by some disappointment of expectations, can avail to obscure the regularities and uniformities of an underlying positive order only so long as the number of instances of the

phenomenon under consideration which the observer has at his command is less than ten or thereabouts.

If we take Bergson's elucidation of the concept of 'Chance' as our clue for unravelling the answer to our question whether the play of 'Chance' can be accepted as a possible explanation of an apparent recalcitrance of human affairs to laws of Nature, we shall have now to put two leading questions to ourselves: First, what is the species of order that we are expecting to find in human affairs? And, second, what is the other species of order with which we are actually confronted when we say that we find ourselves here in the presence of the reign of 'Chance'? In our foregoing inquiry into possible explanations of the manifest currency of laws of Nature in human history, our finding was that these laws governing human affairs were, for the most part, laws current in the Human Psyche's own subconscious underworld; and, if this is the species of order for which we are looking in this field, then the different order, found in fact to be reigning here, that we label 'Chance' because it is not what we had been expecting, must be one or other of three possible alternatives. It may be the order of Physical Nature as contrasted with Psychic Nature, or the order of human will as contrasted with the subconscious level of the Human Psyche, or the order of God's will as contrasted both with human wills and with the by-laws, psychic and physical alike, which the will of God has enacted.¹ These three alternatives would seem to exhaust the possible identities of the order, not identical with an expected subconscious psychic order, that we have left incognito in labelling it 'Chance'. Our negative label must mask some one of these three positive realities, since a label cannot be pasted on to a vacuum. We have already noticed that the 'Chance' which appears to come into play when conflicting human wills frustrate one another is a label masking the self-assertion of the laws of the Subconscious Psyche.² On this showing, the 'Chance' which appears to come into play when these laws of the Subconscious Psyche fail, in their turn, to answer to conscious expectations by asserting themselves must be a label masking the operation of some other positive force.

The possibility that 'Chance' in our present context might prove to be a label masking the order of Physical Nature diminishes to a vanishing point in the light of our inquiry into the amenability of human

¹ A belief in the reality of any of these three kinds of order, like a belief in the reality of the order of Subconscious Psychic Nature, is the offspring of experience wedded to faith. Without the faith that 'is the substance of things hoped for, the evidence of things not seen' (Heb. xi. 1), a human being's experience of Physical Nature, his experience of his fellow human beings, and even his experience of himself, would not guarantee the reality of any of these phenomena; and a belief in the reality of God and of His action in the Universe derives from the same twofold source. The experience of an encounter with God that was attributed to Jacob, Moses, and Samuel, and that was granted to the prophets of Israel, Judah, and Iran according to these prophets' own conviction, may not be experienced even by the prophets in more than one or two brief flashes in a lifetime, while the great majority of human beings may never have this experience at all at first hand; so that a belief in God will be an act of faith for the prophet himself for most of his life and for most of his followers for all of their lives. 'Blessed are they that have not seen, and yet have believed' (John xx. 29) is thus a truth that is conspicuously true of a belief in the reality of God; yet a belief in the reality of one's self, of other selves, and of Nature, Psychic or Physical, also requires a large measure of faith as well as of experience.

² See pp. 326-37, above.

affairs to laws of Nature; for we have found that, by comparison with the jurisdiction of the laws of the Subconscious Psyche, the jurisdiction of the laws of Physical Nature over human affairs has never been of much consequence; and we have also found that, whatever this jurisdiction may have amounted to originally, the human social animal has been singularly successful in discovering how to elude its incidence, and has been liberating himself in this way from Physical Nature's dominion at a pace that has been increasing by geometrical progression. We have watched human beings successfully conspiring to elude the incidence of the astronomical law of the Year Cycle that governs the yield of their domesticated plants and trees; we have watched them similarly eluding the incidence of a physiological law of the Day-and-Night Cycle;¹ and we have also seen them turning to human account even Nature's in-human device of a procession of generation cycles punctuated by the deaths of individuals, when human beings have overlaid Nature's own method of transmitting a racial heritage of instincts and aptitudes through the physiological process of procreation with the artificial human device of transmitting a social heritage of habits and knowledge through the spiritual process of moral and intellectual education.² On this showing, an apparent play of 'Chance' in human affairs is unlikely, if it looms at all large, to mask a reign of laws of Physical Nature; for, *pace* the astrologers, it seems much less likely that human affairs in which we do not discern the operation of laws of the Subconscious Psyche are governed, under the label of 'Chance', by hitherto unrecognized laws of Physical Nature than that they are governed either by hitherto unrecognized laws of the Subconscious Psyche itself or else by the will either of human beings or of God.

When human wills encounter one another without concurring in a common purpose to do God's will, they are prone, as we have seen, to frustrate one another, and their thus unintentionally concerted self-stultification reopens the way for the compulsive laws of the Subconscious Human Psyche to reassert themselves. When a human soul encounters God, what is the outcome of a meeting between wills of such immeasurably unequal potency?

Theologians who have pictured God in Man's image, through a failure to rise to a worship of God in spirit and in truth,³ have sometimes fallen into the spiritual error of imagining that God exerts His irresistible power to make His own will prevail over Man's—either by ruthlessly over-riding it or by craftily bending it to conform to God's will unawares.⁴ This picture of an iron law of God the Tyrant lurking under the mesh that God's guileless creatures label 'Chance' has been painted for us by Bossuet.

'Ne parlons plus de hasard ni de fortune, ou parlons-en seulement comme d'un nom dont nous couvrons notre ignorance. Ce qui est hasard à l'égard de nos conseils incertains est un dessein concerté dans un conseil plus haut, c'est-à-dire dans ce conseil éternel qui renferme toutes les causes et tous les effets dans un même ordre. De cette sorte tout concourt

⁴ See pp. 175-9, above.

à la même fin, et c'est faute d'entendre le tout que nous trouvons du hasard ou de l'irrégularité dans les rencontres particulières.¹

The orator's language is as brilliant as it is masterful, but the theologian's ideas of what God is and how God acts are as unconvincing as they are repellant to any drinker at the fountain-head of Christianity. As God is revealed in the Gospels, He is Love as well as Omnipotence; He is the Soul's father, redeemer, and illuminator, as well as its creator and its master;² and this Christian faith assures us that, when a soul encounters the God of whom this is the authentic Christian picture, Love suspends the fiat of Omnipotence in order to transmute a command into a challenge which confronts the human recipient of it with a free choice between Good and Evil and between Life and Death.³ Such challenges from God may evoke in human souls creative responses that are genuinely free human acts; and this spiritual drama of Challenge-and-Response⁴ is perhaps the key to an explanation of those human affairs in which human action wears the appearance of being at any rate partially exempt from the dominion of laws of Nature.

If we now recall some of our instances of an apparent recalcitrance of human affairs to laws of Nature, we shall find that these are also instances of a creative response to a challenge.

When, for example, a creative individual or minority distinguishes itself by breaking contact with the rank-and-file, forging ahead of them, and then re-entering into contact again, these distinctive moves, which are so many evidences of the minority's freedom of action, are at the same time so many stages in a response that the creative individual or minority has been stimulated to make in answer to some challenge that has been presented to all the members of the society, including the unresponsive rank-and-file, and also perhaps including other individuals or minorities who have made a choice of Evil instead of Good that brings Death instead of Life.⁵

If we now also look again at the history of the art of ship-building in the Modern and post-Modern ages of Western history, in which we have watched the sequence of an acceleration followed by a retardation occurring, not once only, as in the movement of Withdrawal-and-Return, but twice over, we shall find this duplication of the same sequence accounted for here by the presentation of two different challenges in succession.

The challenge that evoked the creation of the Modern Western 'ship' within the half-century A.D. 1440-90 was a political one. Towards the close of the Medieval Age of Western history, Western Christendom found itself not only conclusively foiled in its attempt to break out of its West European homeland south-eastward into Dār-al-Islām and Orthodox Christendom, but seriously threatened by a north-westward-heading counter-attack in which the military resources of Orthodox Christendom and Islam were brigaded under Ottoman auspices.⁶ The dangerousness of Western Christendom's plight in the fifteenth century

was accentuated by geographical circumstances that had perhaps also been partly accountable for the launching of the ill-starred Crusades. The homeland of the Western Christian Society happened to lie at the tip of one of the peninsulas of the Great Eurasian Continent, and a society so precariously situated must sooner or later be pushed into the Ocean by the pressure of mightier forces thrusting outwards from the heart of the Old World if this besieged society did not succeed in forestalling disaster by breaking out of its West-European *cul-de-sac* into some larger *Lebensraum*. By the fifteenth century of the Christian Era the *peine forte et dure* of being crushed to death between the Devil and the Deep Sea had already brought to their last gasp the surviving representatives of an abortive Far Western Christian Civilization in 'the Celtic Fringe' of the Old World; and a Latin Christendom likewise had been exposed, since its birth, to this manifest destiny of all West European societies by which a Celtic Christendom was eventually to be overtaken. In the Crusades the Latin Christians—choosing the Mediterranean Sea as their war-path and faring across it in vessels of the traditional Mediterranean builds—had been moved by a nostalgia for the cradle of their Christian faith¹ to defy Fate by breaking out of Western Europe into the Levant; and the eventual failure of this enterprise had not been followed by a return of the *status quo ante*. The retort to Medieval Western aggression had been in Egypt the replacement of effete 'Fātimids' by militarily efficient Mamlūks,² and in Orthodox Christendom the replacement of an effete East Roman Empire by 'Osmanlis who were still more efficient and far more aggressive than their Mamlūk cousins.'³

These local revolutions which the West's own aggression had precipitated had eclipsed the West's military and political prospects in the Levant, and had made her commercial prospects there dependent on the new Islamic Powers' goodwill. In what other direction was Western Christendom to look for an outlet? A once barbarian no-man's-land in Northern Europe had been eliminated before the end of the fourteenth century of the Christian Era by a parallel northward advance of Western and of Russian Orthodox Christendom which had carried their common frontier up to the shore of the Arctic Ocean;⁴ and, when Western Christendom had taken advantage of Russia's prostration by a tornado of Mongol invasion from the Eurasian Steppe in order to trespass on her Russian neighbour's domain in White Russia and the Ukraine, this eastward aggression overland had been halted, in its turn, by the rise of Muscovy.⁵ Mid-way through the fifteenth century, when the sea-route via the Mediterranean into the Levant and the land-route via Russia into the heart of the Eurasian Continent had both been effectively closed against any further Western expansion in either of these directions, the Atlantic Ocean was the sole remaining frontier of Western Christendom that was not beset by an impassable hostile human cordon; and the Atlantic was thus uninfested by human adversaries of the West only

because it was, and always had been, believed by all denizens of the Old World to be an unharvested and unharvestable sea, setting an impassable physical western limit to the habitable portion of the Earth's surface. In the fifteenth century of the Christian Era the Atlantic was challenging the beleaguered peoples of Western Christendom by confronting them with a choice between two extreme alternatives. If they were not to be driven into the Atlantic in their turn, as they themselves had been driving the hapless Celtic Christians, they must convert Seneca's fancy¹ into fact by conquering an Ocean which not even a poet had ever seriously supposed to be conquerable by Man 'in real life'. The dual alarum of simultaneous challenges from the Atlantic and the 'Osmanli' was the emergency that, within the half century A.D. 1440-90, stimulated Western shipwrights to create an Ocean-faring, globe-encircling sailing-ship, capable of keeping the sea continuously for months on end, of which the like had never before been designed or even imagined.

Why was this fifteenth-century outburst of creative energy in the Western shipwright's trade followed by a spell of relative stagnation lasting some three or four hundred years? Challenge-and-Response is the clue to the answer to this question likewise; for the creation of the Modern Western ship had been so effective a response to the military and political challenge presented to the West in the fifteenth century that the fifteenth-century Western shipwright's epigoni had little incentive for seeking to improve on their predecessors' work until they were eventually shaken out of their lethargy by a new challenge that was not military or political but was economic, and that did not impinge on the Western World from abroad but emerged from within.

The Modern Western ship had been an adequate solution for the Early Modern Western World's besetting problem of *Lebensraum*. It had enabled the Western peoples with one hand to acquire in the Americas what looked like an inexhaustible addition to their reserves of cultivable land, and with the other hand to seize for themselves a monopoly of all the existing Oceanic maritime trade in the World; and this sudden turning of the tables in their favour in their competition with the other living civilizations had not only given the Western peoples full military and political security; it had also amply satisfied their economic needs in an age in which they, as well as their contemporaries, were still living under the traditional economic dispensation of Man in Process of Civilization. In this dispensation—which, in the Lower Nile Valley and the Lower Tigris-Euphrates Basin, had already been a going concern at least as early as the end of the fourth millennium B.C.—agriculture was the staple source of livelihood and the standard occupation, while trade and manufacture were subsidiary and exceptional. In societies of this traditional type, towns and ports that lived by importing foodstuffs and raw materials and paying for these by exporting manufactured goods and by performing the economic services of providing and financing maritime and overland transportation, were few and far between; rarer still were the parasitic capitals of oecumenical empires—a Rome, a Constantinople, or a Peking—which used the lever of political

¹ See Seneca: *Medea*, ll. 364-79, quoted in II. i. 263, n. 1.

power to exact imports without making any economic return;¹ and the only other notable variation on the prevailing economic pattern of subsistence farming was an exchange of cereals and other products of agriculture for products of stockbreeding between the Nomads of the Steppes and their nearest sedentary neighbours. Classical examples of this unusual trade in commodities that were necessities, not luxuries, had been the importation of grain into the homeland of the Hellenic Civilization round the coasts of the Aegean out of the Russian agricultural hinterland of the Great Western Bay of the Eurasian Steppe from about the sixth century B.C. to about the third century of the Christian Era, and the importation of the same staff of life out of Sicily and Apulia into a sixteenth-century Spain² whose heart had been given over to breeding sheep for wool.³

The Western Society continued, like its contemporaries, to live under this traditional economic dispensation for some three centuries (*circa* A.D. 1475-1775) after it had won its economic victory over these other living civilizations in terms of the traditional economic values by monopolizing the Oceanic maritime trade in luxuries and impounding the World's largest still uncultivated reserve of cultivable land. During the last third or quarter of the eighteenth century, however, a new economic revolution—almost comparable in magnitude to the earlier revolution from food-gathering and hunting to agriculture and stock-breeding—declared itself in Great Britain and spread thence progressively to Belgium, Germany, and the Northern United States and eventually to Japan and other Westernizing countries beyond the original bounds of the Western World.

The two outstanding features of this fresh economic revolution were a sudden increase in population at a steeply accelerating rate and a concomitant rise of commerce and manufacturing industry to a decisive preponderance over agriculture as the standard occupations and staple sources of livelihood, no longer merely in tiny, rare, and insulated urban enclaves, but throughout whole countries and regions previously dedicated to subsistence farming. This sweeping subordination of agriculture and stockbreeding to industry was the more impressive considering that Western agriculture and Western stockbreeding, so far from remaining stagnant or regressing, were actually passing at this time through a simultaneous revolution in which their productivity, like the productivity of urban industry, was being notably increased by the jettisoning of traditional methods in favour of new experiments that were as rational as they were radical. The eighteenth-century technological revolution in agriculture⁴ ran neck and neck with the eighteenth-century

¹ See VI. vii. 87-91, for the digging of the Grand Canal in China, after the political unification of the main body of the Far Eastern Society by the Sui Dynasty, in order to bring foodstuffs to a northern capital from a southern centre of agricultural production.

technological revolution in industry, as the nineteenth-century creation of the 'clipper' sailing-ship ran neck and neck with the nineteenth-century creation of the steamship. If, in spite of this sudden spurt of progress, agriculture nevertheless failed to maintain its age-old primacy over industry in a Western and a Westernizing World, the reason was that the eighteenth-century agricultural revolution, by itself, would have been no adequate response—even in combination with the accompanying extension of the acreage under cultivation in Western Europe as well as overseas—to the Malthusian challenge which the eighteenth-century industrial revolution did prove able to meet.

The formidably steep and rapid increase in population, which declared itself in Great Britain first among the countries of the Modern Western World, seems to have been due to a reduction of the death-rate, thanks to an improvement in the standard of public health,¹ which was not offset by any countervailing fall in the birth-rate for the next five or six generations. In Great Britain the fall in the death-rate began to make itself felt *circa* A.D. 1740;² 'between 1740 and 1820 the death-rate fell almost continuously, from an estimated 35.8 for the ten years ending in 1740 to one of 21.1 for those ending in 1821';³ but net rates of reproduction did not begin to fall off in either Great Britain or France before A.D. 1875-80, and not in other West European countries before A.D. 1905-10.⁴ The net increase in the population of Western Europe through this Time-lag between the fall in the death-rate and the fall in the birth-rate was to reach its peak in A.D. 1890-1910.⁵ By the time of writing of the book, published in A.D. 1947, in which these remarkable figures are presented, the average expectation of life in the Western World had risen from the span of thirty-five years, at which it had stood under the *ancien régime*, to a span of no less than sixty.⁶

This great spurt in the growth of population, first in Great Britain and then in other provinces of a Western and a Westernizing World, would have been an economic liability if the explosion of the Industrial Revolution had not responded to the challenge by converting this potential liability into an asset. The Industrial Revolution enabled an increasing population actually to raise its standard of living through a concomitant increase in the volume of economic production that more than kept pace with the increase in the number of mouths to be fed and bodies to be clothed and housed; and our familiarity with this achievement must not blind us to the truth that it was an amazing *tour de force*.

'The spectre of the pressure of population on the means of subsistence which oppressed the mind of Malthus in 1798 was no chimaera. . . . An increase of people . . . does not necessarily mean either a greater effective demand for manufactured goods or an increased production of these in

¹ As many as ten distinct influences operating in Great Britain, from about A.D. 1740 onwards, to reduce the incidence of death are enumerated by T. S. Ashton in *The Industrial Revolution, 1760-1830* (London, 1948, Oxford University Press), p. 4.

⁶ See *ibid.*, vol. i, p. 304.

the country concerned . . . it may just as well lead to a lower standard of life for all!¹—

which, was, in fact, its consequence in Ireland, where the population increased in the late eighteenth and early nineteenth century *pari passu* with the simultaneous increase in the adjoining island. This Irish, and not the English, consequence was likewise the sequel to corresponding increases in the populations of China in the same age under a *Pax Manchuana*, and of India in the second half of the nineteenth century and the first half of the twentieth century under a *Pax Britannica*.

"There are to-day on the plains of India and China men and women, plague-ridden and hungry, living lives little better, to outward appearance, than those of the cattle that toil with them by day and share their places of sleep by night. Such . . . standards . . . are the lot of those who increase their numbers without passing through an industrial revolution. . . .²

"The central problem of the age [A.D. 1760–1830 in Great Britain] was how to feed and clothe and employ generations of children outnumbering by far those of any earlier time. Ireland was faced by the same problem. Failing to solve it, she lost in the 'forties about a fifth of her people by emigration or starvation and disease. If England had remained a nation of cultivators and craftsmen, she could hardly have escaped the same fate, and, at best, the weight of a growing population must have pressed down the spring of her spirit. She was delivered . . . by those who, seeking, no doubt, their own narrow ends, had the wit and resource to devise new instruments of production and new methods of administering industry.³ . . . Britain might have learnt from bitter experience the fallacy of the view that, because with every pair of hands there is a mouth, therefore every expansion of numbers must lead to an increase of consumption, and so of output, if, after the middle of the nineteenth century, there had been no railways in America, no opening up of the prairies, and no steamships.⁴

We can now see what the challenge was which, after a three-or-four hundred-years long interlude of comparative stagnation in the Western art of shipbuilding, evoked, during the half-century A.D. 1840–90, a burst of fresh creative activity—comparable to the previous burst in A.D. 1440–90—which brought forth the 'clipper' and the long-distance steamship in a twin birth. Under the goad of a sudden sharp increase in the pressure of population on the means of subsistence, a Modern Western Society which, so far from being resigned to seeing its standard of living fall, was bent upon raising it, had set out—in the footsteps of the Hellenic Society of the sixth century B.C.⁵—to convert an economy of subsistence farming into an economy of specialized production for export; and, for the first time in the history of Man in Process of Civilization, this economic revolution was now being put in train, not just within the walls of a handful of city-states, but throughout the body social of a hitherto preponderantly agricultural society. This revolutionary economic enterprise could not be carried through to success unless the *entrepreneurs* could multiply, many times over, a maritime carrying capacity that had met the comparatively modest requirements

¹ Ashton, *op. cit.*, p. 6.

² *Ibid.*, p. 161.

³ *Ibid.*, p. 161.

⁴ *Ibid.*, p. 6.

⁵ See I. i. 24–25; II. ii. 38–42; III. iii. 122; IV. iv. 200–14; IX. viii. 429–30.

of the traditional economy; for these requirements had been limited to the transport of luxuries for a small governing class and of foodstuffs and raw materials for a few towns and ports specializing in commerce and industry. In order to make the revolutionary new economic régime work, maritime carrying capacity had to be expanded at short notice to cater for the transport of bulky and heavy primary commodities for consumption, not just by a few exceptional urban communities, but by the entire body social of a society that was making itself preponderantly industrial instead of remaining preponderantly agricultural.

Maritime carrying capacity could be expanded along three lines: by increasing the number of ships in commission, by increasing their size, and by increasing their speed and thus increasing the frequency of their voyages; and all three expedients were, in fact, resorted to in the Western World in face of the nineteenth-century Western maritime carrying-capacity crisis.

The line of least resistance was, of course, to shirk the arduous task of structural and mechanical innovation by simply increasing the number of ships of the customary size, build, and drive.

'The data available show that the changes in the size of vessels were not notable in England until after 1830, even though the proportion of the larger vessels to the total increased, especially after 1730. If we were to study the shipping of Europe as a whole, the changes in the size of merchant vessels would be less considerable than in the case of England alone. Down to 1850 no merchant vessels are recorded with a registered tonnage in excess of 1200 tons, and there were very few vessels in England in the group from 420 to 1199 tons. There were large numbers of vessels of that rate in the Mediterranean as early as 1500; there were proportionately more in Holland than in England, though the size of Dutch vessels was probably not as great as that of the larger Mediterranean carriers. Throughout the period [*circa* A.D. 1572-1830] the merchant fleets of the different countries included large numbers of very small vessels.'¹

¹ Usher, A. P.: 'The Growth of English Shipping, 1572-1922', in *The Quarterly Journal of Economics*, vol. xlii (Cambridge, Mass. 1928, Harvard University Press), p. 476.

'There were changes in the proportions between the definitely small and the medium-sized vessels in all the countries, but less change in England than elsewhere, because the conditions in England were especially favourable to the persistence of small units in the carrying trade' (*ibid.*, pp. 476-7). The average tonnage of a British merchantman had risen to a surprisingly small degree during the two centuries between the end of King James I's reign in A.D. 1625 and the end of King George III's in A.D. 1820. During James I's reign, the normal tonnage of English merchantmen had jumped from 100 tons to 300/500 tons, and between A.D. 1675 and A.D. 1680 sixteen East Indiamen had been built with tonnages ranging as high as 1,600 tons; but after A.D. 1702 the average figure for an East Indiaman had dropped back to 350/400 tons; and, though it had risen again in A.D. 1750 to a standard of 499 tons, and in A.D. 1786-90 to a new level of 1,200 tons, the average tonnage of British merchantmen of other ownership did not rise concomitantly. In the British merchant marine in A.D. 1810, apart from the East India Company's fleet, there were only twenty ships with a tonnage of more than 600 tons, and none with a tonnage of more than 1,000 tons (Abell, W.: *The Shipwright's Trade* (Cambridge 1948, University Press), pp. 99-100).

This virtual stationariness of the average size of the standard merchantman in the Western World in general, and in Great Britain more especially, over a period of some two hundred years ending *circa* A.D. 1830 is the more remarkable considering that, within the same period, the volume of British maritime trade was not static, but, on the contrary, was subject to perceptible fluctuations. 'The curve for the tonnage of the merchant fleet indicates that there were three periods of active growth: 1663-1730, 1770-1811, 1840-1910. The intervals between these periods, while not registering actual decline, were periods of relative stagnation, particularly the later intervals. The clearances in foreign trade disclose two periods of growth: 1663-1760 and 1801-1910' (Usher, op.

By contrast, from *circa* A.D. 1830 onwards, increases in the size of ships, requiring revolutionary changes in their build, and soon also in their drive, came to contribute far more than increases in the number of ships in commission towards the now steeply rising increase in the aggregate tonnage of the United Kingdom merchant marine, as can be seen from the following figures in the tables compiled by Usher.¹

Year	Number of vessels	Register tonnage
1788	12,461	1,279,062
1830	19,174	2,201,592
1860	27,663	4,658,687
1890	21,591	7,978,538
1910	21,090	11,555,663

Percentage of Vessels in the United Kingdom Merchant Marine in Each of the Different Tonnage-Classes Distinguished in the Series of Columns Set Out Below

Year	Under 100 tons	100-419 tons	420-1,199 tons
1788	31.1	62.1	6.8
1830	25.2	62.4	12.4

Year	Under 100 tons	100-399 tons	400-1,199 tons	1,200-1,999 tons	2,000-3,999 tons	4,000 tons and over
1869	9.6	27.4	45.9	15.6	1.2	0.3

It is manifest that the almost six-fold increase in the United Kingdom merchant marine's aggregate register tonnage from a figure of 1,551,072 tons in A.D. 1799 to a figure of 9,304,108 tons in A.D. 1900 was mostly accounted for by an increase in the size of vessels, and not by an increase in their numbers, considering that, between the same two dates, that saw a 600 per cent. increase in aggregate tonnage, the numbers increased by hardly more than 50 per cent., from 12,461 in A.D. 1799 to 19,982 in A.D. 1900, after having reached and passed in A.D. 1860 a peak figure of 27,663.² It is no less evident that the increase in size could never have

cit., p. 474). 'The rapid growth in the seventeenth century is comparable to the growth of the late nineteenth century, which we have been inclined to think of as unexampled in the centuries preceding' (ibid., p. 472). Yet, in spite of the building of sixteen abnormally large East Indiamen during the years A.D. 1675-80, an increase in size evidently counted for much less than an increase in numbers in the doubling, between A.D. 1663 and 1688, of both the tonnage of the English merchant marine and the clearances in England's foreign trade (see the figures in Table I, on p. 467, and Table II, on p. 469, of Usher, op. cit.). 'It is important to note that the commercial growth of the late seventeenth century, as shown by both sets of data, was not accompanied by any large increase in population, whereas the increase in population was very considerable in the nineteenth century' (ibid., p. 474).

¹ The two sets of figures set out above are extracted respectively from Table I, on p. 467, and from Table IV, on p. 475, of Usher, op. cit. In Table I the figures for A.D. 1830, by comparison with those for A.D. 1788-1825, have been cut down by about 7 per cent. through the exclusion of lost vessels formerly carried on the register. The figures of tonnage for the years beginning with A.D. 1860, by comparison with those for A.D. 1830-50, have been raised by about 7.5 per cent. through a change in the rules for the measurement of tonnage that became effective in A.D. 1857.

² See Usher, op. cit., Table I, on p. 467.

been carried to the lengths attained in the event without an accompanying revolution in build.

'Some increase in size would have been possible without a change in materials. Wooden vessels could be built up to 4000, and possibly 5000, tons, but with rapidly increasing costs of construction and maintenance. Serious structural difficulties would have been encountered in building very large wooden vessels, because the stems and stern-posts must needs be single timbers, and there are fairly definite limits to the size of first-class timbers for these purposes. The introduction of iron and steel disposed effectively of all these problems. This radical change should be borne in mind in any discussion of the size of vessels in the earlier periods. The revolution in the character of the merchant fleet is a chapter in the history of the late nineteenth century—an outgrowth of the development of the iron ship.'¹

The employment of iron made it feasible, as we have seen,² to build clippers of double the tonnage of the largest previous standard size of sailing-ship; yet, even when the problem of construction had thus been solved, there were limits to the possible tonnage of a sail-borne ship even of the square rig in which the total spread of sail could be increased, up to a point, by adding to the number of the tiers of sails and to the number of the masts; and the size of the nineteenth-century British merchantman, like that of the fifteenth-century Portuguese lateen-rigged caravel,³ would have been confined, perforce, within the limits thus set by the technique of sail-drive, if revolutionary-minded nineteenth-century British shipwrights had not made the further innovation of propelling their new-fangled iron hulls by steam-power instead of by wind-power. The tonnage of British steamships, as distinct from the tonnage of all British merchantmen, whether steam-propelled or sail-borne, doubled between A.D. 1860 and A.D. 1868 according to Rostow;⁴ and the ever more preponderant part that was being played by the increase in steam-propelled tonnage, as compared with the increase in wind-propelled tonnage, in the aggregate increase of United Kingdom merchant-marine tonnage, is reflected in the fact that the United Kingdom merchant marine's approximate carrying power, adjusted for steam, rose, according to Usher,⁵ from 4,068,000 tons in A.D. 1850, when there was an aggregate register tonnage of 3,651,133 tons distributed among 25,984 vessels of both kinds, to 30,924,000 tons in A.D. 1900, when there was an aggregate register tonnage of 9,304,108 tons distributed among 19,982 vessels.⁶

It will be seen that, when nineteenth-century shipwrights were challenged, by the explosion of the Industrial Revolution, rapidly to cater for an enormous increase in marine carrying capacity which had to be conjured up somehow if an audaciously revolutionary economic enterprise was not to end in a catastrophic failure, the shipwrights solved the

⁴ See Rostow, W. W.: *British Economy in the Nineteenth Century* (Oxford 1948, Clarendon Press), p. 23.

⁵ In Usher, *op. cit.*, Table I, on p. 467.

⁶ In Schumpeter, J. A.: *Business Cycles* (New York 1939, McGraw-Hill, 2 vols.), vol. i, p. 268, the United Kingdom merchant marine's approximate carrying-power, adjusted for steam, is reckoned, as by Usher, at rather less than 31 million tons for A.D. 1900, but at rather more than 8 million tons for A.D. 1850.

crucial problem with which the Industrial Revolution had thus confronted them by enlisting new technical resources that the Industrial Revolution itself had placed at their disposal. The creativity displayed in the nineteenth-century shipwrights' response was proportionate to the severity of the challenge that evoked it. But, as soon as the problem of carrying capacity had been solved through the creation of a long-distance steamship whose speed could be progressively increased *pari passu* with progressive increases in its size, there was a slackening of the pressure that had been constantly stimulating the shipwrights' inventive faculties during the preceding fifty years; and this relaxation of tension would seem to explain why it was that, in shipbuilding, the rate of innovation during the sixty years A.D. 1890 to 1950 was markedly slower than it had been between A.D. 1840 and A.D. 1890, in spite of the fact that, during the six decades ending in A.D. 1950, the general progress of Western technology had been continuing to accelerate in a geometrical progression.

The sensitiveness, speed, and vigour of the Western shipwright's responses to two altogether different challenges within the four and a half centuries running from *circa* A.D. 1440 to *circa* A.D. 1890 are striking evidences of human freedom of action in response to a technological challenge; but Technology is, after all, the field where, if anywhere, evidences of human freedom are to be expected, considering that Man never comes so near to being master of a situation as when he is dealing with Non-Human Nature. Man seldom shows anything like the same mastery in his dealings either with the Subconscious Psyche underlying his personality or with the other personalities who are his fellow human beings; and it is therefore perhaps more remarkable if we find evidences of Challenge-and-Response giving birth to human freedom on the spiritual as well as on the technological plane. We do, in fact, find such evidences here too when we recall the part played by Challenge-and-Response in generating the diversity between corresponding episodes in the histories of different civilizations.

The diversity in the duration of the growth-phases of civilizations has manifestly been the consequence of a recurrent freedom of choice that brings with it, each time, both a chance of success and a risk of failure. As we have found in a previous context,¹ the process of social growth consists in a concatenation of acts of Challenge-and-Response in which a successful response to one challenge gives rise to another challenge which may be met by another successful response giving rise to yet another challenge in the series. It will be seen that, in each successive act, the recipients of the challenge of the hour are free to choose between a Good and an Evil that are fraught with Life and with Death;² and this means that each act raises afresh the issue 'to be or not to be'. In any such series of encounters between God the deliverer of the challenge and Man the recipient of it, there is manifestly nothing that makes it impossible for the spinning of a golden thread of challenge-met-by-successful-response-leading-to-further-challenge-met-by-further-successful-response to continue *ad infinitum*. It is equally manifest that, at the

¹ In III. iii. 119-20.

² Deut. xxx. 15-19.

presentation of each successive challenge, there can be no assurance that the spinner will not fail, this time, to add another fathom's length to his life-line; for in each act Man is free to choose Death instead of Life; and, each time, his momentous choice depends on the uncertain issue of a spiritual struggle within his soul between an aspiration towards Grace and a gravitation towards Original Sin.

The severity of this perpetually recurring struggle is indicated by our finding that, out of twenty-two known civilizations,¹ there was only one that could not be certified to be either dead or in disintegration by the twentieth century of the Christian Era. It is true that these figures did not warrant any inferential estimate of a civilization's normal expectation of life, because this species of Society was at this date still so young, and the number of its representatives was still so few, that any attempt at a generalization must be subject to a stultifyingly wide margin of error. Yet, even if the statistics gave no legitimate ground for pessimism, it might be argued that each additional round might be likely to make the game more perilous, since a sinful Human Nature was apt to be tempted by every successful response to a challenge into succumbing either to the active sin of hybris or to the hardly less ruinous passive sin of resting on its oars.² If 'the greater the success, the greater the temptation' were in truth one of the laws to which the Human Psyche was subject, then it would seem to follow that an equilibrium which had to be unstable if it was to be a vehicle for the growth-process must be prone to become ever more precarious with each successive victory of Life over Death.

This besetting danger, which was the price of freedom, was advertised in the spectacle of disintegrating, petrified,³ arrested,⁴ and abortive⁵ civilizations, and was illustrated in the history, not only of human societies, but of terrestrial life itself. Every species of living creature is an earnest of growth, inasmuch as it is the fruit of some past creative mutation of an antecedent species and might become in its turn the seed of some further creative mutation into yet another species; yet at the same time every living species 'is a halt', and it is this 'by definition', since it 'is essentially a created thing'.⁶

The tragic breakdown of the Hellenic Civilization in the flower of its growth was sensitively forecast in the premonitory arrest of the growth of the Attic art of the tragic drama in a generation that lived to see the Atheno-Peloponnesian War.

'Tragedy—as also Comedy—was at first mere improvisation. . . . Tragedy advanced by slow degrees; each new element that showed itself was in turn developed. Having passed through many changes it found its natural form, and there it stopped (ἐπαύσατο, ἐπεὶ ἔσχε τῇ ναύτης φύσιν).'⁷

The changes through which the Athenian tragic drama had passed

⁶ Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), p. 251, quoted in III. iii. 235.

⁷ Aristotle: *Poetics*, chap. iv, § 12 (1449a), translated by Butcher, S. H.: *Aristotle's Theory of Poetry and Fine Art*, 3rd ed. (London 1902, Macmillan), pp. 18-19.

before its development was arrested had been rapid as well as radical; for a run of no more than three generations had seen the development begin and end; and the end and the beginning had both been abrupt. The 'natural form' attained by Attic tragedy at the hands of Sophocles and Euripides was conscientiously reproduced thereafter, without any further creative innovations, by their successors, not merely down to Aristotle's time, but until this genre of literature went out of cultivation in the Hellenic culture's latter days; and in the prelude to the story a traditional dramatic ritual, performed as a spell for ensuring the regular recurrence of an annual harvest and vintage, had, as far as we know, remained for centuries on end as static as the technique of agriculture itself until the genius commemorated in the historical or legendary name of Thespis transfigured this archaic religious institution into a rudimentary artistic vehicle for conveying the deepest feelings, problems, and interests of a flowering civilization. Considering that Aeschylus took over this new-born art in its swaddling clothes and handed it on to Sophocles all but full-grown, the three generations that saw the beginning and end of the growth of Attic tragedy virtually contract to the span of one single generation only.

How are we to account for a period of creativity hardly longer than the life-time of Aeschylus, when this brief spurt of growth has for its overture an aeon of the timeless ritual of the *ἐναυτός δαίμων*,¹ and for its epilogue an aeon of the conventional post-Euripidean Hellenic drama? The answer to this question is to be found in the history of the city-state of Athens in which the art of Tragedy was brought to life, like Pygmalion's statue, only to be turned to stone, like the Phaeacian galley,² in full career. The transfiguration of an Attic agricultural rite into a fine art was one of the expressions of a contemporaneous social and cultural transfiguration of Athens herself as a result of the Solonian revolution.³ In accomplishing this revolution in her own life, Athens made herself 'the education of Hellas';⁴ yet a title which conveyed the truth about the Athens of an age beginning with the generation of Solon at the turn of the seventh and sixth centuries B.C. and ending with the generation of Aeschylus (*vivebat* 525/524-456 B.C.) had ceased to be deserved by Athens before it was coined for her in 431-430 B.C. by Pericles; for by that date Athens, under the influence of no other leader than Pericles himself, had hardened into the repellent figure of 'a tyrant city'⁵ who was selfishly misusing her power in Hellas in the narrow interests of her own citizens, and was jealously on her guard against the extension of an Athenian franchise that had now become a lucrative privilege. This moral fall of Athens had taken place during the half-century that had elapsed between the repulse of Xerxes's invasion of Continental European Greece and the outbreak of the Atheno-Peloponnesian War; and the act in which it is most expressively symbolized is the scrutiny and purgation of the official register of Athenian citizens in 445-444 B.C., on the occasion of a distribution of grain, presented to the Athenian people

⁵ "Τυραννίδα ἔχερε τῇ νάρχῃν" (Cleon, in a speech put in his mouth by Thucydides Book III, chap. 37).

by their ally Egypt, which prompted them to act on a restrictive law enacted, at Pericles' instance, six years earlier.¹ It is assuredly no accident that this symbolic date of Athens' spiritual narcosis should coincide with the artistic *floruit* of a Sophocles in whose hands the Attic art of Tragedy came to the end of a growth that had been so vigorous in the generation of Sophocles' own immediate predecessor Aeschylus. The hybris bred in Athenian souls by the triumphant success of Athenian responses to the Hellenic World's sixth-century ordeal of encirclement and fifth-century ordeal of invasion had blighted the Athenian people's moral growth; and the halt in the development of the Attic art of Tragedy was a consequence and an index of this spiritual disaster.

The element of freedom in human affairs which reveals itself in a diversity in the duration of the growth-phases of civilizations, and whose epiphany and atrophy we can see—in the history of the growth and petrification of the Attic art of Tragedy—as sharply focused as if we were gazing through a magnifying glass, is likewise revealed in a diversity in the relations of Religion to the rises and falls of civilizations in different generations; and in this field, as in that, we can discern that human freedom springs from an encounter in which Man is summoned to respond to a challenge presented by God.

The challenge of social breakdown, disintegration, and dissolution had been identical in the histories of the civilizations of each of the three generations of this species of society that had run their course so far, and, as between the divers representatives of a single generation, it had been identical *a fortiori*; yet the responses made to this spiritual challenge in the second generation had, as we have seen, been immensely more fruitful than any responses made in either the first generation or the third; and, among these responses in the second generation, it seemed unlikely to a latter-day Christian historian that either Hinduism or Islam would be placed on a spiritual par with either the Mahāyāna or Christianity by a judge who was wholly disinterested and at the same time fully qualified (if any such godlike human arbiter was anywhere to be found). This wide diversity in the responses to an identical challenge becomes intelligible if—and perhaps only if—we see in it the consequence of a freedom of choice which God had granted to human souls; and thus we see freedom springing from Challenge-and-Response in the most crucial of all the ordeals through which Man in Process of Civilization had been reminded of his Creator in the course of the five or six thousand years during which the human climber had been striving to scale this precipitous 'pitch' on the cliff-face of his terrestrial purgatory.²

D. THE FREEDOM OF HUMAN SOULS THAT IS THE LAW OF GOD

IN the present Part of this Study we are trying to gain some insight into the relation between Law and Freedom in History; and, if we now reapproach this question in the light of the evidence that we have been gathering in the course of an empirical inquiry, we shall find that the question has already received an answer. How is Freedom related to Law? Our evidence declares that Man does not live under one law only; he lives under two laws, and one of these two is a Law of God which is Freedom itself under another and more illuminating name.

This 'perfect law of liberty'¹ is also a law of Love; for Man's freedom could only have been given to Man by a God who is Love in person,² and this divine gift can only be used by Man for freely choosing Good and Life instead of Death and Evil³ if Man, on his side, loves God well enough to be moved by this responsive love of his to commit himself to God, by making God's will his own, as unreservedly as God has committed Himself to Man by giving Man the power of free choice.

Our wills are ours, we know not how;
Our wills are ours, to make them thine.⁴

'La sua voluntade è nostra pace';⁵ and this self-surrender of Man's will to God's, which the Prophet Muhammad has preached in the lapidary word *islām*, is 'the glorious liberty of the children of God'.⁶ 'History is, . . . above everything else, a call, a vocation, a dispensation to be heard and responded to by free human beings—in short, the interaction of God and Man';⁷ and this truth has been partially divined by pre-Christian Hellenic philosophers and been faintly echoed in the utterances of post-Christian Western heresiarchs. Plato has testified that the Gods do not drive human beings, but steer them;⁸ and Hegel's description of creation as a synthesis obtained through a settlement of accounts between a thesis and an antithesis is a recognizable academic abstract of the living truth, even though it makes nonsense of it by perversely depotentializing the creative act of God's and Man's mutual love into the logical procedure of an intellect that 'by itself, moves nothing'.⁹

Law and Freedom in History prove to be identical, in the sense that Man's freedom proves to be the law of a God who is identical with Love. But this finding does not dispose of our problem; for in answering our

⁶ Rom. viii. 21.

⁷ Lampert, E.: *The Apocalypse of History* (London 1948, Faber), p. 45.

⁸ Plato: *Critias*, 109 B-C: 'They tended us as herdsmen tend their flocks, live-stock and nurselings, except that they did not use physical force, as shepherds do when they drive beasts by beating them. The Gods led Mankind by steering them. They guided Mankind's course from astern, which is the way in which a living creature is most easily manipulated, and they used as their rudder the instrument of Persuasion to influence the Human Psyche in accordance with the Gods' own ideas.'

⁹ Aristotle: *Ethica Nicomachea*, Z2, pp. 1139 A-B, quoted in III. iii. 231, n. 1, and on pp. 327-8, above.

original question we have raised a new one. In finding that Freedom is identical with one of two codes of Law, we have raised the question of the relation in which these two laws stand to one another; and at first sight the answer to this new question would seem to be that the Law of Love and the Law of Subconscious Human Nature, which both manifestly have jurisdiction over human affairs, are not only different but are contradictory, and are not only contradictory but are incompatible; for the law of the Subconscious Psyche, which our Western psychologists have located in the psychic abyss from which the Babylonian astrologers once projected it on to the stars in their courses, holds in spiritual bondage human souls whom God has called to work with Him in freedom. When one of two dispensations spells liberty, while the other spells servitude, are we not wantonly obscuring the truth and confusing the issue by using the same word 'law' to describe them both?

The more searchingly we compare these two 'laws', the wider the moral gulf between them seems to be. If we appraise the Law of Nature by the standard of the Law of Love, and see through Love's eyes everything that Nature has made, behold, it is very bad.¹

Ay, look: high Heaven and Earth ail from the prime foundation;
All thoughts to rive the heart are here, and all are vain.²

And, in the bitterness of his riven heart, Man explores divers possible explanations of a moral anomaly and enormity that he cannot explain away and cannot take for granted.

One of the conclusions that have been drawn by human spectators of the moral evil in the Universe is that this chamber of horrors cannot be any god's handiwork.

Quod si iam rerum ignorem primordia quae sint,
hoc tamen ex ipsis caeli rationibus ausim
confirmare aliisque ex rebus reddere multis,
nequaquam nobis divinitus esse paratam
naturam rerum: tantâ stat praedita culpâ.³

To explain this evil universe as the undesigned outcome of a fortuitous concourse of indestructable atoms of matter is indeed the line of least resistance for an Epicurean in whose belief the gods are *rois fainéants*; but this Epicurean solution of the problem of Evil will not satisfy either a logician who sees through the word 'Chance' to an undesignated positive order lurking incognito under this negative label, or a Christian in whose belief God is the Love that has bestowed on Man a law that is Freedom. The Christian finds himself compelled to choose between two other alternatives, both of which are grievously disconcerting: Either the God who is Love must be also the creator of a manifestly ailing Universe, and therefore be either an incompetent demiurge or a malignant *mater saeva cupidinum*;⁴ or, if the God of Love is not one aspect of a Janus-headed Godhead that, in another aspect, is Our Lady of the

⁴ Horace: *Odes*, Book I, Ode xix, l. 1.

Jungle, *πότνια θηρῶν*, then the ailing Universe must have been created by another god who is not the God of Love. In the second century of the Christian Era the Catholic Christian Church impaled itself on the first of the two horns of this dilemma, while a Marcionite Christian Church impaled itself on the second.

Marcion was a posthumous disciple of the Apostle Paul who drew, with an un-Pauline rigour, the logical consequences of a Pauline distinction between opposing realms of Mosaic Law and of Christian Grace. Marcion's uncompromising jealousy for the immaculateness of the God who is Love made it impossible for him to remain in communion¹ with any fellow Christian

Who trusted God was Love indeed,
And Love Creation's final law,
'Tho' Nature, red in tooth and claw
With ravin, shriek'd against his creed.²

Marcion broke with a Catholic Christianity because he had wrestled with the question

Are God and Nature then at strife,
That Nature lends such evil dreams?³

and had given, for his part, the affirmative answer that William Blake's *anima naturaliter Marcionita* was to give to the same question some seventeen hundred years later.

When the stars threw down their spears
And watered Heaven with their tears,
Did He smile His work to see?
Did He that made the Lamb make thee?

Blake's and Marcion's solution for this moral enigma is to attribute the creation of an ailing Universe to a god who, so far from being identical with God the fount of Love and Father of the Saviour, is His antithesis inasmuch as the creator god's distinctive characteristic is the forbidding negative quality of being both unloving and unlovable. In Blake's, as in Marcion's, theology, God the Creator's role is to play the Erinyes to God the Redeemer's Orpheus.⁴ While the Saviour God wins souls by love, without ever terrorizing them by threats of constraining them by force, the highest moral level to which a creator god depicted as a Prussian drill-sergeant *in excelsis* is deemed capable of rising is to exact outward conformity with the prescriptions of a cut-and-dried moral law by imposing savage penalties for formal breaches of it. He is spiritually impotent to move his human creatures by touching their heart-strings.

This melancholy taskmaster god whom Marcion identifies with a Mosaic Jehovah and whom Blake names 'Urizen' and nicknames 'Nobodaddy' would be bad enough if he performed his self-imposed duties

¹ Marcion founded a church of his own in A.D. 144, after his doctrine had been rejected by the Catholic Christian community at Rome. For the date, see Harnack, A. von: *Marcion, Das Evangelium vom Fremden Gott* (Leipzig 1921, Hinrichs), pp. 24 and 18*.

⁴ See IV. iv. 123-5.

competently even according to his own limited lights; but his work is a hideous failure; and this failure must be due either to incompetence or to malevolence. Even if the Creator were to be acquitted on the charge of wilful malice, he would have to be convicted of being either culpably unaware of his wantonly assumed responsibilities or else no less culpably indifferent to them; and either of these verdicts would be damning in the judgement of a decently human jury; for no human being who was not shockingly obtuse or callous could imagine himself ever having had the heart, if he had been creating morally irresponsible sentient living organisms, to victimize his own creatures by enduing them with the capacity to suffer when he was not endowing them with any capacity to turn suffering to moral account. It would have been still harder for him to imagine himself ever having implanted, in any morally responsible sentient living creatures of his, the capacity not only to suffer but to sin without having made sure in advance that he would never be driven by force of circumstances to lead these human beings into temptation and would always be sufficiently master of the situation to be able to deliver them from evil.

"That there is a "soul of good in things evil" is unquestionable; nor will any wise man deny the disciplinary value of pain and sorrow. But these considerations do not help us to see why the immense multitude of irresponsible sentient beings, which cannot profit by such discipline, should suffer; nor why, among the endless possibilities open to omnipotence—that of sinless, happy existence among the rest—the actuality in which sin and misery abound should be that selected."¹

When a human soul thus finds itself confronted with two numinous presences which are morally antithetical² to one another, yet which, none the less, both have to be recognized as being indubitably divine, the most obvious conclusion is that there must be, not one god, but two gods, in the Universe; and this argument came home *ad hominem* to the writer of this Study when, with the present chapter in mind, he was reading simultaneously Adolf von Harnack's *Marcion, the Gospel of the Stranger God*, and Thor Heyerdahl's *Kon-Tiki*.³

"They that go down to the sea in ships, that do business in great waters, these see the works of the Lord, and His wonders in the deep."⁴

But they that go down to the sea, not in a ship, but on a balsa-log sieve, see works of God the Creator that are yet more wondrous and appalling than any that discover themselves to seafarers who 'plough across' the water, in latter-day Western style, 'with roaring engines and piston-strokes'.⁵ "The sea contains many surprises for him who has his floor on a level with the surface and drifts along slowly and noiselessly";⁶ and in the experience of the crew of the *Kon-Tiki* most of these surprises were

¹ Huxley, T. H.: *Evolution and Ethics*, the Romanes Lecture, 1893, reprinted in Huxley, T. H. and J.: *Evolution and Ethics*, 1893-1943 (London 1947, Pilot Press), p. 76.

² Marcion's principal recorded original work (published as a commentary on a Bible composed of expurgated versions of some of Saint Paul's Epistles and of the Gospel according to Saint Luke) bore the expressive title *Antitheses*.

⁴ Ps. cviii, vv. 23-24.

⁵ Heyerdahl, op. cit., p. 117.

⁶ Ibid., p. 117.

nightmares: the whale shark with a toadlike jaw four or five feet wide that came grinning like a bulldog;¹ the three luminous monsters larger than elephants;² the devilish green eyes of giant squids which shone in the dark like phosphorus;³ and the ghastly life-and-death struggle between sharks, tunnies, and dolphins.⁴ 'When we turned in on these evenings, in our mind's eye we saw greedy, open shark jaws and blood, and the smell of shark meat stuck in our nostrils';⁵ yet these predatory monsters of the deep were bone of the bones and flesh of the flesh⁶ of these horrified human spectators; for all terrene life is known to have originated in the sea, and the chemical composition of the human body betrays the marine origin of a perhaps not less predatory Mankind. Almost, Thor, thou persuadest me to be a Marcionite⁷—yet, though Man's heart may be moved by the *visio malefica* of Creation to curse a god who has brought these horrors into being, Man's head will forbid him to embrace a theology that breaks down under examination.

While Marcion is on strong ground in affirming that Creation is bound up with Evil, he is on weak ground in denying that Creation has anything to do either with Goodness or with Love; for the truth is that God's love is the source of Man's freedom, and that a freedom which gives vent for Creation thereby opens a door for Sin. The ordeals in which Man has to exercise his freedom to choose between Life and Death and between Good and Evil can be described, with equal faithfulness to truth, as challenges from God and as temptations from the Devil. We have watched the Devil unintentionally serving God's purpose by helping God to carry on His creative activity, and we have even wondered whether, under the disguise of a satanic malice, a divine love may not be operating through a Mephistopheles without whose left-handed assistance God's work might be brought to a halt by its own paradoxically paralysing perfection.⁸ Every encounter between a human soul and God is thus inevitably fraught with possibilities of Evil as well as Good; and this chain that links Evil, as well as Good, to Love cannot be severed by the knife-edge of Marcion's logic. All morally sensitive hearts will sympathize with Marcion's zeal to keep the hem of a Divine Love's garment unspotted; yet the same fine feeling will make such hearts revolt against the logic of Marcion's consequent denigration of a Sub-conscious Psyche that animates Man and Beast alike, and that bears up human personalities on the surface of its abyss, as the unplumbed Pacific bore up Thor Heyerdahl's balsa-log raft. For this primal living creature that is the Great Mother of Life on Earth is not only the Kali whose obscene womb has spawned Leviathan and Behemoth, the Dragon and the Bull;⁹ it is also the Pytho whose oracular omphalos—in 'that shady city of palm trees'¹⁰ where 'Heaven lies about us in our infancy'¹¹—is the fount of Poetry and Prophecy; and, if we believe that the voice of a God who is Love thus speaks to the Soul through the

¹⁰ Vaughan, Henry: *The Retreat*.

Subconscious in the divinely inspired accents of a Dante and a Deutero-Isaiah, we may venture on to believe that Love is also the God who has created the tentacles of the squid and the teeth of the whale-shark. 'For the creature was made subject to vanity, not willingly, but by reason of Him who hath subjected the same in hope.'¹

In logic, this is evidently a harder saying than Marcion's *creatorem aut ignorasse aut noluisse aut potentem non esse*;² but in reality, as registered in the full gamut of our human experience, Marcion's vindication of God's love at the cost of denying His unity is no less evidently wider of the mark than Irenaeus's vindication of the identity of God the Almighty Creator with God the All-loving Redeemer at the cost of identifying with one another two epiphanies of the Godhead which are logically and morally irreconcilable from a human standpoint. And experience's testimony to the truth of a logical and moral paradox is strikingly vindicated by the findings of a science which cannot be suspected of having gone out of its way in order to ratify an Irenaean system of Christian theology. The travail of striving to reconcile two irreconcilable epiphanies of God, which torments the consciousness of the adult saint and scholar, is declared by at least one school of post-Modern Western psychological research to have already tormented a Subconscious Psyche in an antecedent struggle through which the future saint and scholar's moral personality has been originally acquired at a stage of early infancy in which God's future place in the Soul's universe has been occupied by the infant child's Mother.

'As the baby begins . . . early in the . . . second year of post-natal life . . . to draw a distinction between itself and outer reality, it is the Mother³ who comes to represent the external world and to mediate its impacts on the child. But she dawns upon its growing consciousness under two opposite aspects. She is the child's chief object of love, and its fountain-head of satisfaction, security, and peace. But she is also Authority, the chief source of power mysteriously set over the child and arbitrarily thwarting some of the impulses along whose paths its new life quests outwards. The frustration of infantile impulse generates anger, hate, and destructive wishes—what the psychologists generally style aggression—directed against the thwarting authority. But this hated Authority is also the loved Mother. The infant is thus faced with the primal conflict. Two irreconcilable sets of impulses are directed towards the same object, and that object is the centre of its surrounding universe.'⁴

Thus, according to one psychological theory, the conscious moral conflict of maturity is subconsciously anticipated in early infancy; and, in the infantile, as in the adult, struggle, a spiritual victory exacts its spiritual price. 'Primitive Love conquers Primitive Hate by saddling it with the burden of primal guilt';⁵ and Psychology thus endorses

⁵ *Ibid.*, p. 110.

the Irenaeus anti-Marcionite Christian finding that Love and Hate, Righteousness and Sinfulness, are indissolubly linked with one another through the chain of Creation.

'Without a mother, no strong love focussed on a personal object; without such love, no conflict of irreconcilable impulses; without such conflict, no guilt; and, without such guilt, no effective moral sense.'¹

A latter-day Western psychology's discovery, in an infantile Sub-conscious Psyche, of two irreconcilable impressions of one Mother, who represents Authority as well as Love in her own indivisible person, testifies to the veracity of Irenaeus's intuition that the apparent co-existence of two gods, morally antithetical to one another, must be, not a faithful reflection of the divine reality, but a mirage reflecting merely a diffraction of the unitary image of the One True God in the prismatic lens of an imperfect human spiritual vision.² God the Lover and Redeemer of souls must, in spite of Marcionite appearances to the contrary, be identical, in an ineffable reality, with God the Creator of sub-conscious terrestrial life, as well as with God the Creator of a material cosmos whose mathematical perfection is not marred by any moral bar sinister on the inanimate level. This paradoxical truth that Love is inseparable from the Almighty Power put forth in Creation is visually portrayed in Medieval Western Christian *mappae mundi* in which the latent figure of Christ Crucified holds together and sustains the World; and this image does not become less true to reality if we replace the Greek cross on which the seventeenth-century Western mathematicians hung their analysis of a static universe by the Saint Andrew's cross, embodied in the three-dimensional form of an hour-glass, on which a twentieth-century Western mathematical physicist had learnt to hang his analysis of a universe travelling through Space-Time.

For finite human minds, it is morally inexplicable that God the Creator of Life on Earth should have anticipated the gait of His creature *Homo Faber* by feeling his way *gradatim et pedetemptim*. They can understand why Man should have had to serve an apprenticeship in flaking flints in order to learn how to build an atomic pile; but why did an Almighty God who is Love and Creativity in one not avail Himself of His power to create a Buddha and a Saint Francis *de toutes pièces*? Why did He elect to approach the creation of these spiritual masterpieces of His by the slow, laborious, clumsy, and apparently maleficent method of creating

¹ Ibid., p. 110.

² The psychological process by which the *Visio Beatifica* is distorted in a sinful soul's sight is perhaps adumbrated in the psychologists' account of the distortion of the image of a child's parents in the sight of the refractory infant child.

'It is characteristic of this first beginning of our ethical mechanism that it is in many respects unrealistic. The parents have to exercise control over the child, and in so doing will be strict, or even harsh, and will certainly sometimes appear cruel. But to their actual and real strictness is added an unreal quota and quality of unpleasantness in the shape of the child's own thwarted aggressiveness. Thus the dialectic of growth succeeds in intro-jecting a parent-figure very different from the real parent, since it is "endowed with all the crude and primitive aggressiveness of the child himself. In this way, it would appear, does the super-ego acquire its more alarming and barbaric features", and this is why the semi-conscious or unconscious core of the super-ego (which may persist even throughout life) is so harsh and so unnecessarily severe, calling all the time upon the Self to make atonement for its load of primal guilt' (Huxley, J.: 'Conclusions', in Huxley, T. H. and J., op. cit., p. 206. Cp. p. 195).

amoebas, cholera germs, sharks, and sabre-toothed tigers by the way? 'Did He that made the lamb make thee?' Can God, Marcion again interpellates, be almighty if He is unable, or all-loving if He is unwilling, to evoke sainthood except at the cost of a spiritual tension and struggle fraught with the certainty of suffering and with the possibility of sin? Is the rarely trodden path to sainthood only a higher and steeper reach of the steep and arduous ascent climbed by every human infant that acquires a moral personality at the cost of a psychic conflict? Human minds cannot find a logically self-consistent answer to this riddle of creation because they cannot view the travail of creation with the all-comprehending vision of a Divine Creative Love which sees everything that It has made, from the shark to the saint, and beholds that it is very good.¹ Yet even a finite human understanding may surmise that the history of Life on Earth describes a curve through Space-Time-Psyche in which each of the imperfect and ephemeral successive living moments out of which this curve is built up has its absolute value for the *Deus Crucifixus* whose Cross is at once the sure evidence of God's love and the firm frame on which the moving curve of His creation through suffering hangs. 'Wie es eigentlich gewesen' is a mystery that may pass the understanding of any creature afloat in the creative Time-stream; but the historian's very consciousness of the relativity of his own infirm standpoint is evidence that he has some inkling of an absolute *ὁπου στῆ*; and perhaps even he may catch a fleeting glimpse of 'wie es geworden' by clutching, for an instant, the skirts of 'I am'.² In such flashes of illumination a human understanding may divine that the service performed for God by Evil as an instrument of creation in His hands is a reality in God's creative work in Time which is transcended in those higher spheres that are entered by a contrite Doctor Marianus in the last act of the second part of Goethe's *Faust*; and this intuition is shared with Christianity by Buddhism if the conception of *Nirvāna* is to be interpreted as implying the extinction, not of Life itself, but of the tragically creative experiences of Life-in-Time.³

In Life-in-Time, as human souls experience it in their passage through This World, a finite human understanding, that cannot resolve an apparent moral conflict between divers laws reigning within human ken, can at least discern that, from the standpoint of creatures subject to their dominion, these laws stand to one another in a hierarchical relation, and that this hierarchy of laws is a Jacob's ladder up which God is ever seeking to draw His Creatures towards Him, rung over rung. This partial intuition of the role of Law in History, imperfect though it be, throws some light on the relation between Law and Freedom if we also take the view that 'Freedom', like 'Chance' and 'Heterodoxy', is a relative concept, not an absolute one, and that, accordingly, Freedom from the dominion of a law can be won only at the price of accepting the dominion of some other law that is higher in the scale in the sense of having power to liberate from the rule of the previously prevailing law anyone able to live up to the rule of the new law and willing to live

¹ Gen. i. 31.

² Exod. iii. 13-15 (see V. vi. 42, n. 1).

³ See V. vi. 18, n. 1.

under it. Freedom from the ineffectual law of an anarchic Iceland can be won only by submitting to a stern Norwegian King's Peace; freedom from the capricious law of Xerxes can be won only by submitting to the inexorable law of the Lycurgeoan *agóge*;¹ freedom from the brutal law of Ishmael can be won only by submitting to an arbitrary law of Moses; freedom from the law of the Mosaic letter that killeth can be won only by embracing a law of Christ's spirit that giveth life.²

Since it is thus impossible to win freedom from the service of one law except by entering into the service of some higher law, the liberation that is achieved at each upward step from law to law is inevitably at the same time a sacrifice. The rise from the level of a law of inanimate Physical Nature to the level of a law of Subconscious Psychic Nature liberates Life at the cost of inflicting Death and of kindling sensations and passions that, in a retrospective view from a subsequently attained human standpoint, display a moral spectrum diffracted into Good and Bad. The rise from the level of a law of Subconscious Psychic Nature to the level of a law of Conscious Will liberates the Human Spirit at the cost of charging a creature hitherto as innocent as the lamb and the tiger with the crucial responsibility of having to make divine or satanic choices between Right and Wrong. Liberty from a lower law can never be purchased except at this cost of submitting to a higher law; and, when purchased at this cost, it can be preserved only at the price of eternal vigilance; for an empirically experienced hierarchical relation between these divers laws current in the Universe, which seems to certify that they are so many enactments of a single divine legislator, creates an agonizing conflict of laws for any of God's creatures that have accepted His challenge to transfer their allegiance from some lower law of His to some higher one.

'I delight in the Law of God after the Inward Man; but I see another law in my members, warring against the law of my mind, and bringing me into captivity to the Law of Sin which is in my members.'³

And Saint Paul's testimony from his personal experience was endorsed by a nineteenth-century Western man of science who had done as much as any man to write the laws of Nature large on his contemporaries' mental map.

'Cosmic Nature is no school of virtue, but the headquarters of the enemy of Ethical Nature. . . . Social progress means a checking of the cosmic process at every step and the substitution for it of another, which may be called the ethical process, the end of which is not the survival of those who

¹ This point is made by Herodotus (*Histories*, Book VII, chaps. 101-5) in an imaginary conversation which he puts into the mouths of Xerxes and the exiled King of Lacedaemon, Dámarátus, who is serving on Xerxes' staff during the Achaemenian Power's invasion of Continental European Greece in 480 B.C. The Spartan quisling is represented as saying to the Persian autocrat:

"Though the Lacedaemonians are free, their freedom is not absolute. They are subjects of a lord and master whose name is the Law; and they fear this master a great deal more than Your Majesty's subjects fear Your Majesty. At any rate, they never fail to carry out whatever orders this master may give them; and his orders are always the same: "The troops are forbidden to retreat in the face of the enemy, however great his numerical superiority; their orders are to remain at their posts and there conquer or die."'

² 2 Cor. iii. 6.

³ Rom. vii. 22-23.

may happen to be the fittest, in respect of the whole of the conditions which obtain, but of those who are ethically the best. . . . The ethical process is in opposition to the principle of the cosmic process, and tends to the suppression of the qualities best fitted for success in that struggle. . . . What would become of the garden if the gardener treated all the weeds and slugs and birds and trespassers as he would like to be treated, if he were in their place? . . . The practice of that which is ethically best—what we call goodness or virtue—involves a course of conduct which, in all respects, is opposed to that which leads to success in the cosmic struggle for existence. In place of ruthless self-assertion it demands self-restraint. . . . It repudiates the gladiatorial theory of existence. . . . Man, as a “political animal”, . . . is compelled to be perpetually on guard against the cosmic forces, whose ends are not his ends, without and within himself. . . . The ethical progress of Society depends, not on imitating the cosmic process, still less in running away from it, but in combating it. . . . The history of Civilisation details the steps by which men have succeeded in building up an artificial world within the Cosmos. . . . In virtue of his intelligence, the dwarf bends the titan to his will. . . . That which lies before the Human Race is a constant struggle to maintain and improve, in opposition to the State of Nature, the State of Art of an organised polity, in which, and by which, Man may develop a worthy civilisation, capable of maintaining and constantly improving itself, until the evolution of our globe shall have entered so far upon its downward course that the cosmic process resumes its sway and, once more, the State of Nature prevails over the surface of our planet.¹

If Freedom is to be taken as being a relative concept, and if all the mutually contrary and contradictory laws in an ascending hierarchy are in some sense laws of God, even though human minds cannot resolve an apparent moral conflict between God’s Law of Love and God’s Law of Subconscious Psychic Nature, is there any sense in which the Law of Love can be called God’s Law without qualification, and in which the freedom to be found in God’s service is, after all, not relative, but truly ‘perfect’?² When we have heard Christ’s challenge ‘Take up the cross and follow me,’³ can we credit His assurance ‘My yoke is easy and my burden is light’?⁴

The answer to this question seems to be that ‘the glorious freedom of the sons of God’, which they enjoy under the Law of Love, is not merely the relative freedom of a release from the law of a compulsive Subconscious Psyche; it is also the perfect freedom possessed by God Himself, which an all-loving Creator has bestowed upon His creature Man at the sacrificial price of emptying Himself⁵ of almighty power. Under a Law of Love which is the law of God’s own Being, God’s self-sacrifice challenges Man by setting before Man an ideal of spiritual perfection which Man has perfect freedom to accept or to reject. The Law of Love leaves Man as free to be a sinner as to be a saint. The one thing that Man

¹ Huxley, T. H.: *Evolution and Ethics*, the Romanes Lecture, 1893, and *Prolegomena*, 1894, reprinted in Huxley, T. H. and J.: *Evolution and Ethics*, 1893–1943 (London, 1947, Pilot Press), pp. 78, 81, 51, 52, 81–82, 59, 82, 83, 83, 60.

² ‘Whose service is perfect freedom.’—The Second Collect, for Peace, in the Order for Morning Prayer Daily throughout the Year, in *The Book of Common Prayer* according to the Use of the Church of England.

³ Mark x. 21.

⁴ Matt. xi. 30.

⁵ Phil. ii. 7, as translated in the Revised Version.

can be sure that this law will never do to him is to make him take up the Cross against his will; for the Law of Love is the one law that can never be served involuntarily. There is not, and cannot be, any externally applied coercion to obey this law, or any externally imposed punishment for disobeying it. The punishment for disobedience is inherent in the act of disobedience itself; for, in using his God-given freedom to reject the ideal in which the Law of Love consists, a human soul that has been created 'to glorify God and fully to enjoy Him for ever'¹ is rejecting 'the true end of Man', and is running, self-driven, into the disaster that overtakes Man through the inexorable working of the Law of Subconscious Human Nature, if he fails to respond to God's challenge to rise to the service of the Law of Love by using his God-given freedom to choose what is the will of God for him. Moreover, even this self-inflicted disaster is no final judgement and no irrevocable doom, since mundane disaster brings with it the opportunity of learning through suffering for any sinner who repents of his sin and is moved by his penitence to seek the aid of God's grace.

Thus, on this highest visible pitch of a cliff-face up which the creature is being drawn by the call of his Creator to essay a perilous ascent, we catch a glimpse of God's hand reaching down to meet the upstretched hand of the struggling human climber; and, at the point where hands meet in the clasp of Love, Law and Freedom cease to be distinguishable; for 'tis only he that loves not that is fettered by compulsion'.² Since the God who is Love is also Omnipotence, a soul that loves is liberated by the maker and master of all laws from a bondage to laws of the Subconscious Psyche which Babylonian souls used to project on to inexorable stars in their courses and which Hellenic souls used to personify as malignant *kêres* and *daimones*; and a liberating truth which had once proved potent to set free³ fast-fettered Hellenes and Babylonians might once again be taken to heart by the children of a post-Christian World which had been vainly seeking to ban those dread psychic principalities and powers⁴ in the name of a Science that was as impotent to exorcize them as any pre-Christian magic.

XII

THE PROSPECTS OF THE WESTERN CIVILIZATION

A. THE NEED FOR THIS INQUIRY

AS he took up his pen to write the present Part of this book, the writer was conscious of a sense of distaste for this self-imposed task which was due to something more than a natural shrinking from the obvious hazards of a speculative subject.

On the 30th November, 1950, it was, of course, clear that the forecasts about the prospects of the Western Civilization that he was venturing to put on paper might be belied by events almost before the ink was dry, and perhaps long before the manuscript could be printed and published.¹ Yet, if the risk of making himself ridiculous had been a governing consideration in the writer's mind, this would have deterred him from ever embarking on any part of this Study; and, in committing himself to Part Twelve of the work after having already given eleven hostages to Fortune, he could take heart from the reflection that at this date the prospects of the Western Civilization were at any rate very much less obscure than they had been when, in the early months of the year 1929, he had been drafting the original notes for this Part that were now lying at his elbow.

In A.D. 1929, before the break on Wall Street, it was already possible to discern the general direction in which the Western World was moving, but it was far more difficult then than it was twenty-one years later to picture the alternative possible routes along which this movement might take its course. In 1929 it could already be foreseen, for example, that, in a Westernizing World that had become coextensive with the entire habitable surface of the Planet, a process of unification which, on the economic, technological, and intellectual planes, was accelerating in a geometrical progression was bound to prevail on the military and political planes likewise, sooner or later; yet in 1929 it was still impossible either to guess how long it would take to arrive at this consummation or to imagine how the unificatory process would overcome a passive and active opposition which, at that date, were no less impressive than was the contrary *nisus* towards unification. In 1929 an historian seemed to be in presence here of a contest like the legendary race between the hound who could never fail to catch his quarry and the fox who could never be caught; and on the military and political plane this apparently insoluble riddle of A.D. 1929 was illustrated by the situation of the Great Powers

¹ 'Lorsqu'il s'agit . . . d'un ensemble aussi complexe, la difficulté de reconstituer le passé, même le plus récent, est toute comparable à la difficulté de construire l'avenir, même le plus proche; ou, plutôt, c'est la même difficulté. Le prophète est dans le même sac que l'historien. Laissons-les y.' (Valéry, Paul: 'La Crise de l'Esprit,' in *Variété* (Paris 1924, Gallimard, Éditions de la Nouvelle Revue Française), p. 17).

as a group, and most pointedly by the particular situation of France. Though the Danubian Hapsburg Monarchy had become a total wreck in the War of A.D. 1914-18, the other seven of the eight Great Powers in existence at the outbreak of war had all survived, and, of these, Germany and Russia, which had both been prostrate in A.D. 1919, were manifestly both on the road to recovery ten years later. As for France, on the one hand it was manifest in A.D. 1929—and had indeed been evident since A.D. 1870-1—that she must resign herself, sooner or later, to losing the status of a first-class Power which she had enjoyed continuously ever since her decisive victory over an aggressive England in the fifteenth century; on the other hand it was no less manifest that she was still determined to play her traditional role of 'la Grande Nation', though she might be patently staggering under her present load and be hardly less patently anxious about her future.

Prospects that were thus so bafflingly ambiguous in A.D. 1929 were, by comparison, startlingly clear in A.D. 1950 for an observer who took as his criterion either France in particular or the Great Powers as a group.

By 1950 two decades of French history that had still been below the historian's horizon in 1929 had given a practical demonstration of the psychic alchemy by which 'a nation of patriots'¹ who had once prodigally sacrificed their lives on the goddess France's altar could transmute itself into a nation of 'defeatists'; and one of the most unpredictable, surprising, and significant metamorphoses in this sombrely miraculous transformation-scene was the inversion of French nationalists into French collaborators with a German attempt to reduce France to the status of being Germany's helot-in-chief *en permanence*. The French slogan, to the tune of which the Vichyssois had danced this German dance, had been 'la France seule'; for, under this parade of patriotically refusing to pull Great Britain's or any other foreign country's chestnuts out of the fire at the cost of burning French fingers, French 'defeatists' had indicated that they would reject all foreign proffers of help to throw off a German yoke to which France herself had submitted rather than endure the agony of remaining at war, like Norway, Holland, and Belgium, with an enemy who had overrun her metropolitan territory; and, though France had, in the end, been liberated in spite of herself, and had indeed anticipated the landing of the liberating American and British armies on French soil by throwing up a native resistance movement after the turn of the tide against Germany in a war from which France had previously contracted out, the Vichy chapter of French military, political, and psychological history had left a palpable mark on the spirit of a France who in A.D. 1950 was officially execrating the Vichy régime and all its works.

In 1950 there were Frenchmen who were resigned in advance to seeing France submit to a Russian yoke as she had submitted to a German yoke in A.D. 1940; and those other Frenchmen who were imbued with the spirit of the maquis rather than of Vichy agreed with their 'defeatist' compatriots in feeling that, in 1950, France could no longer stand

¹ Hayes, C. J. H.: *France, a Nation of Patriots* (New York 1930, Columbia University Press).

alone in the true sense in which these words expressed France's former political ideal of genuine national sovereign independence. In 1950 the more sanguine and constructive spirits in France saw their country's salvation in a merger of her once jealously vindicated separate national identity in a supra-national Western community that was to embrace at least all Western Europe and was perhaps eventually to bestride the Atlantic. In the hearts of Frenchmen who were 'good Europeans', as in those of Frenchmen who were 'defeatists', the ideal of parochial nationalism was thus dead; and this was a portent for the Western World as a whole; for, in a post-Medieval Western Society, France had been the archetype of the self-sufficiently sovereign independent national state; and therefore, if, in France, a five-hundred-years-old tradition of political parochialism had been broken between the years 1933 and 1940 by the irresistibly mightier force of an explosive German imperialism, it could be foreseen that tougher wills to retain a sovereign national independence might likewise be broken by the impact of forces mightier than a National-Socialist Germany.

Great Britain, for instance, had refused to give in when, in 1940, France's will to resist Germany had broken down; yet from 1931 to 1940 Great Britain had been France's fellow-traveller down the road of appeasement which France had followed to the bitter end; and, after 1940, Great Britain's happy issue out of afflictions to which she had then exposed herself at the eleventh hour—by then taking an heroic decision—had been due to the mighty reinforcement of her own inadequate national strength by the arms of a Soviet Union and a United States who were successively drawn into the war on the anti-Axis side thanks to a German and a Japanese miscalculation that were, either of them, egregious. The Second World War left Great Britain's two eventual allies alone still capable of playing the part of Great Powers in a struggle for existence between parochial states that had now become vastly more strenuous than it had been in A.D. 1929; America's and Russia's fellow victor Great Britain, no less than a defeated Germany, Japan, Italy, and France, had fallen out of the running; and a Second World War which had thus reduced the number of the Great Powers in a Westernizing World from seven to two had, in the act, forged a new weapon that might prove potent enough to break the spirit of parochial Powers even of a Russian or an American calibre. Even if the uranium atom bomb should fail to produce the same morally devastating effect on these two loose-limbed giants as it had produced on a congested and exhausted Japan, an inconscionable post-Modern Western Science still had up her sleeve a hydrogen atom bomb that could be guaranteed, if ever detonated, to blow even a United States or Soviet Union out of the water—at the cost, perhaps, of making the whole face of the Planet uninhabitable by human or any other living organisms.¹

¹ The following comment on this passage, and on other passages to the same effect in the present Part of this Study, has been made by Professor William McNeill:

'I doubt the likelihood of total extinction of Civilization, still more of Mankind, as a result of a third world war. The will to resist and the capacity to conduct an organized campaign breaks down short of physical extinction; and the breaking point is removed farther from the point of physical extinction in proportion as the waging of war becomes

Thus in A.D. 1950 it was already far less open to doubt than it had been in A.D. 1929 that, in a struggle for supremacy between two titanic post-Christian Western idols—a Moloch Nationalism and a Juggernaut Technology—the treads of Juggernaut's irresistibly high-powered bulldozer were going to trample over the antique plates of Moloch's brazen furnace; and this lesson from the experience of twenty-one sinisterly illuminating years had made experiments in prognostication less hazardous by pinning the still patently open questions within a framework of relatively sure prediction. On the 1st December, 1950, it was still impossible to foresee whether the third round in the struggle was going to be played out without another explosion of 'total war', and whether life on the planet would survive if a Third World War did break out within the bosom of an oecumenical human society that had now learnt how to split the atom. It could, however, now be foreseen that, if a Western Technology's victory over a Western Nationalism were to be consummated without the annihilation of the Human Race, the story would end in the monopoly of the technical means of annihilation in the hands of some single authority whose fiat would be virtually law, not merely in one island, continent, or hemisphere, but throughout the *Oikoumenê*—in whatever quarter of the globe this oecumenical authority's geographical base of operations might be located, and whatever the constitutional form in which its monopoly of world-power might be veiled or advertised. This concentration of political power might or might not be achieved by the 'knock-out blow' that had brought into being a *Pax Romana* and all the other 'universal states' so far known to History; the parochial *peritura regna* might be ostensibly preserved instead of being overtly liquidated; but, whatever course and shape the political unification of a post-Modern Westernizing World might take, it seemed safe to predict that the acquisition of atomic weapons would bring about the political unification of the *Oikoumenê* in one way or another—and this sooner rather than later—considering that a *Pax Romana* had been forced upon an Hellenic World, and a *Pax Hanica* upon a Sinic World, by the intolerableness of the alternative choice of continuing to suffer the consequences of wars between parochial states waged with unprecedented atrocity by new-fangled 'methods of barbarism'. If this revolutionary political effect could be produced by 'total war' fought with such comparatively humane and innocuous weapons as the spear, the bow, and the horse, it must assuredly be produced by atomic warfare *a fortiori*.

Thus in A.D. 1950 an intellectual prospector could enter on a mental exploration of the Western Civilization's future with rather more confidence that he could have felt in A.D. 1929; he need not feel now that he was sentencing himself to undertake a Psyche's task; and the writer's own distaste for his present subject ought therefore to have been appreciably diminished by the intervening passage of two enlightening addi-

a more complex activity, requiring the coordination of larger numbers of specialists both in and outside of the fighting forces. At the time of Germany's surrender in A.D. 1945 about 80 per cent. of Germany's industrial equipment was still intact, in spite of the bombing operations of the Allied Powers. This, however, does not mean that a particular battle-ground, such as Europe, could not be destroyed more or less completely by alien fighting forces whose bases of supply were situated elsewhere.'

tional decades of history if it had been merely a recoil from the risk of a hazardous intellectual adventure. Why was it, then, that, so far from diminishing, his distaste had been increasing steadily in the meantime? The answer to this question was not obscure to the writer himself. The reason was that this growing disinclination of his had in fact little or nothing to do with the difficulty of estimating the Western Civilization's prospects, but was rooted in a reluctance to throw overboard one of the cardinal principles governing the writer's whole approach to his study of History. He was distressed by a fear that, if he allowed himself to single out any one civilization for special treatment, he might be abandoning a standpoint from which alone it was, in his belief, possible to see in true perspective the whole history of a species of Society of which the Western Civilization was one, but only one, representative; and his belief in the rightness of this non-Western standpoint had been confirmed, in his personal judgement, by the results of two decades spent in trying to read the map of history from a non-Western angle of vision.

One of the stimuli that had originally spurred the writer to embark on the present Study was an intellectual revolt against a current Late Modern Western convention of identifying a parvenue and provincial Western Society's history with 'History', writ large, *sans phrase*. In the writer's view this convention was the preposterous offspring of a distorting egocentric illusion¹ to which the children of a Western Civilization had succumbed like the children of all other known civilizations and known primitive societies. In a latter-day chapter of Western mental history this blight of egocentricity had been the nemesis of an act of hubris. Western minds had contracted their vision to the narrow limits of a parochially Western horizon because they had despised and rejected the cultural heritages of Christianity and Hellenism that had been bequeathed to them in the Bible and the Classics. This, in the writer's belief, was an intellectual effect of Original Sin from which an historian must thoroughly purge himself in order to win any hope of being able to catch and communicate even a glimpse of the truth; and, if it was true that an argument must find a point of departure in some axiom or other, then the unavowed and unavowable axiom of egocentricity ought to be ruled out by adopting the contrary axiom that all the representatives of any species of human society are philosophically on a par with one another.² This spiritual discipline, which no historian could afford to neglect in any age of the history of any society, was incumbent *a fortiori* on an historian of Western origin and upbringing in an age of Western history in which the Western Civilization happened to be in the ascendant. The writer, for his part, had taken to heart this counter-axiom of a philosophical parity between all societies of the same species; it had justified his faith in it by serving him as his pole star for steering his course through the first six parts of the present Study; and, though, in a later Part,³ the value of the civilizations known to have existed up to date had been found to be unequal as a matter of historical fact on the evidence of an assay in which the touchstone had been the part played

¹ See I. i. 158-64.

³ See VII. vii. 422-3 and 444-9.

² See I. i. 175-7.

by the breakdowns and disintegrations of civilizations in the history of Religion, the result of this test had not been to re-exalt the Western Civilization to the pinnacle on which it had once been placed by a naïvely vulgar native Western egocentric prejudice; the finding had been that the civilizations of greatest mark and moment in the history of Religion had been civilizations of the second generation—the Syriac Civilization, the Indic, the Hellenic, the Sinic—and that, by comparison with these, the Western Civilization and its contemporaries of the third generation had been ‘vain repetitions of the heathen’¹ from the standpoint of an observer who saw the guide-line of History in a progressive increase in the provision of spiritual opportunities for human souls in transit through This World.²

The writer’s own adoption of this standpoint had confirmed and reinforced his original reluctance to single out the Western Civilization for special treatment. After having done his best, throughout the first eleven parts of this Study, to battle against a sin that beset his Western mind so easily,³ was he to capitulate at the last moment to this tribal infirmity? Was he deliberately to redistort an historical perspective that he had been at such pains to correct? In deciding, in spite of such misgivings, to abide in A.D. 1950 by a plan originally drawn up in A.D. 1927–9, he was bowing to the logic of three facts which had lost none of their cogency during the intervening years.

The first of these facts was that, in the second quarter of the twentieth century of the Christian Era, the Western Civilization was perhaps the only extant representative of its species that did not show indisputable signs of being already in disintegration. Of the seven other extant civilizations, five—namely the main body of Orthodox Christendom and its Russian offshoot, the main body of the Far Eastern Civilization and its Korean and Japanese offshoot, and in the fifth place the Hindu Civilization—had already not only entered into, but passed through, the universal state phase in a familiar rhythm of social disintegration;⁴ and, though, on the strictest view, it might be held that, pending the epiphany of a universal state, disintegration could never be diagnosed with absolute certainty,⁵ a scrutiny of the histories of the Iranic and Arabic Muslim civilizations revealed strong evidence of these two societies having broken down in the second decade of the sixteenth century of the

¹ Matt. vi. 7.

² See VII. vii. 555–68.

³ Heb. xii. 1. When a Westerner of the present writer’s age and upbringing was conscious of being perpetually beset by his collective Western egocentricity, the difficulty of laying aside this sin must have been still greater for his younger Western contemporaries, since the writer himself had had the good fortune to be born into a generation which, in England, had still been educated on the Bible and the Greek and Latin Classics, and not on any native Western cultural pabulum. As a consequence of this fifteenth-century Italian education, the writer’s spiritual home was, not a post-Christian Western World, but a pre-Christian Hellas; and, whenever he was moved to put his deeper and more intimate feelings into words, they found expression in Greek or Latin verse, and not in the English vernacular that happened to be his mother tongue. In the twentieth century of the Christian Era it was indeed hard for any living observer—Western or non-Western—to take an unbiased view of the Western Civilization and its prospects. A Western observer of the West would find it difficult to correct a bent towards his own collective Western ego without falling into the opposite inclination to lean over backwards.

⁴ See Table I in vol. vi, p. 327, reprinted as Table I in vol. vii, p. 769, *ad fin.*

Christian Era, when the Iranic Society had been split by an explosive recrudescence of Shi'ism, and when the ensuing struggle between the two fractions of this fissured body social had led an Ottoman Sunni Iranic Muslim Power to conquer the sister Arabic Muslim Society. On this showing, the Western Civilization in the twentieth century of the Christian Era was apparently in the singular position of being the only one among all the known representatives of the species, extinct or extant, whose present state and future prospects might still be open questions. While all the others were either certainly dead or almost certainly *in articulo mortis*, the Western Society alone was possibly still in its growth-phase.¹

This uncanny uniqueness of the contemporary situation of the West first struck the writer when he was putting on paper his original notes for the last portion of this Study in the early months of A.D. 1929; and the subject and title of the present Part were then immediately conjured up in his mind by a sudden reminiscence of a passage in *The Rime of the Ancient Mariner*. In his mind's eye he saw the picture of the stricken ship becalmed on the boundless expanse of the South Seas, with the crew prostrated by the torments of thirst; he saw the spectre bark shooting towards him from the horizon, on which the ribs of its skeleton hull had shown up sinisterly black against the blood-red disk of a setting sun; and, as the dreadful apparition drew near, he descried, on board, two demonic figures, one of which was Death, while the other was still more ghastly than her grim companion.

Her lips were red, her looks were free,
Her locks were yellow as gold:
Her skin was as white as leprosy,
The nightmare Life-in-Death was she,
Who thicks men's blood with cold.²

He saw Life-in-Death winning the throw of the dice in her game with Death for the prize of the ship's crew; and his recollection of the poem ran on to bring before his eyes a vision of the dying sailors giving up the ghost one by one, till, on board the spellbound ship, the Ancient Mariner is left alone alive with his dead companions lying around him.

The many men so beautiful
And they all dead did lie:
And a thousand thousand slimy things
Lived on: and so did I.³

When these words in which Life-in-Death's legendary victim describes his thoughts and feelings were ringing in the present writer's ears in A.D. 1929, he was conscious of a weird contrast between the Ancient Mariner's agony in his loneliness and the complacency of a post-Modern Western World whose own singular situation had evoked in the writer's mind these echoes of Coleridge's poetry. At that date the prospects of the Western Civilization appeared, on the whole, to be favourable. After

shuddering under the shock of the First World War, the Western body social seemed to have recovered its balance and to have resumed its rudely interrupted course. The spectre of an imminent break on Wall Street was then still hull-down below the horizon, and the tragic sequence of errors, crimes, and sufferings which this financial catastrophe in the United States was to bring in its train was still unsuspected, *a fortiori*. It looked, in fact, as if the Western ship had triumphantly weathered an unusually violent storm; and, if it had, what sense could be made of an irrational imagination's oracular impulse to identify the West's situation in A.D. 1929 with the Ancient Mariner's plight after the death of his companions? Need a once more prosperous Western Civilization take the other civilizations' deaths to heart? In A.D. 1929 it had been easier than it was in A.D. 1950 for Western common sense to dismiss this disturbing question.

One debating point that Common Sense could perhaps still make in A.D. 1950 was to suggest that, whatever the West's plight might now be, it was at any rate not singular, since it could not be distinguished from the plight of the two Islamic civilizations on any impartial interpretation of the evidence. If the evidence did not convict the West of being already in disintegration, then it would not convict the Islamic civilizations either; while, conversely, if it did convict these, then the West must stand convicted in their company. The Islamic civilizations, like the Western Civilization, were not yet in a universal state; yet the Western Civilization, like the Islamic civilizations, was showing signs of being already in a Time of Troubles. In a previous Part¹ we have detected, in the Modern and post-Modern chapters of Western history, the disintegration-rhythm of lapse-rally-relapse recording itself in a sixteenth-century outbreak of a paroxysm of Wars of Religion, in a lull lasting from the third quarter of the seventeenth century to the third quarter of the eighteenth,² and in a paroxysm of Wars of Nationality beginning with the outbreak of the American War of Independence.³ If an impartial inquirer into the state of the extant civilizations in A.D. 1950 were to decide, notwithstanding this evidence, to give the Western Civilization the benefit of the doubt—on the ground that, whatever other symptoms of disintegration might be recognizable in recent Western history, it was at any rate still certain in A.D. 1950 that the West had not yet entered into a universal state—the same inquirer might perhaps feel bound to give the same benefit to the pair of Islamic civilizations on the same grounds. Yet, even if, in this point of not being yet demonstrably in disintegration, the Western Civilization's ambiguous situation were found to be shared with the West by two of its seven contemporaries, the second of the facts that seemed to qualify the Western Civilization for receiving special treatment in a study of History was a fact of Western history which had no parallel in the history of any other extant society.

This unique fact of Western history was that, in the course of some five centuries ending in A.D. 1950, the expansion of the Western Society and the radiation of the Western culture had brought all other extant civilizations and all extant primitive societies within a world-encompass-

¹ In V. vi. 312-21.

² See IV. iv. 142-50.

³ See IV. iv. 165-7.

ing Western Civilization's ambit.¹ Already, some two hundred years before this date, the approaching unification of the entire *Oikoumenê* round a Western centre had been discerned and announced by a Western man of genius. In an *Esquisse d'un Plan de Géographie Politique* Turgot had put on record the propositions

'que chaque peuple qui a devancé les autres dans ses progrès est devenu une espèce de centre autour duquel s'est formé comme un monde politique composé des nations qu'il connaissait et dont il pouvait combiner les intérêts avec les siens; qu'il s'est formé plusieurs de ces mondes dans toute l'étendue du globe indépendants les uns des autres, et inconnus réciproquement; qu'en s'étendant sans cesse autour d'eux, il se sont rencontrés et confondus, jusqu'à ce qu'enfin la connaissance de tout l'univers, dont la politique saura combiner toutes les parties, ne formera plus qu'un seul monde politique, dont les limites sont confondues avec celles du monde physique.'²

By A.D. 1950 Turgot's prognostication had been vindicated by accomplished facts. By this date the two Islamic civilizations, which had not yet entered into the universal state phase, were no less compromisingly enmeshed in a Western net than the five non-Western civilizations which had passed through this phase already. Even the Russian Civilization, which, among these seven societies, had taken the lead, up to date, in making a fight for the preservation of its own identity, ethos, and genius, had found, as we have seen,³ that the only practical way of trying to hold its own against the West was to master the technology which was the source of Modern Western Power and to step into a Western arena as a combatant arrayed in a panoply fashioned on the latest Western model. This world-wide ascendancy of a Western culture, at least on the plane of Technology, even over the non-Westerners who had dedicated themselves to the task of leading an anti-Western crusade, might prove to be a short-lived phenomenon; indeed, a glance at the history of a post-Alexandrine Hellenic Civilization's impact on the Oriental civilizations of the day—a history which had long since completed its course and was therefore on record from beginning to end—seemed to suggest that a Western ascendancy, in its turn, was likely to be liquidated in the long run by military, political, and religious counter-attacks of the kind that had once brought the ascendancy of Hellenism to an end. Yet this Hellenic precedent seemed also to suggest that even an eventual liquidation of a now prevailing Western ascendancy would come to pass in a world that had been unified within a framework of Western workmanship; and this unique role of a Modern Western Society as a unifying agency over a literally world-wide range of operations was the second fact that demanded—in A.D. 1950 no less than in A.D. 1929—a special consideration of the Western Civilization's prospects.

The third of the facts that seemed to make this inquiry imperative was the alarming fact that in the twentieth century of the Christian Era, perhaps for the first time in the history of the Human Race, all Mankind's

¹ See V. v. 152-3, and pp. 479-90, below.

eggs had been gathered into one precious yet precarious basket as a consequence of the Western Civilization's world-wide expansion.

Gone are the days when madness was confined
 By seas or hills from spreading through Mankind:
 When, though a Nero fooled upon a string,
 Wisdom still reigned unruffled in Peking;
 And God in welcome smiled from Buddha's face,
 Though Calvin in Geneva preached of grace.
 For now our linked-up globe has shrunk so small,
 One Hitler in it means mad days for all.
 Through the whole World each wave of worry spreads,
 And Ipoh dreads the war that Ipsden dreads.¹

Some degree of interdependence was, of course, nothing new in the history of human societies. The civilizations had, no doubt, begun to influence one another, as well as all the extant primitive societies, by their radioactivity at an early date after their first epiphany;² and these impersonal influences had been followed up by military and political assaults since the time when—at about the turn of the eighteenth and seventeenth centuries B.C.—an Egyptiac Middle Empire that had never collided with Hammurabi's reconstructed Sumeric Empire of the Four Quarters had been overrun, after Hammurabi's death, by Hyksos barbarian invaders who had imbibed a tincture of the Sumeric Civilization from Eurasian Nomads in their rear.³ A latter-day Soviet Union's 'geopolitically' commanding position—with sally-ports opening on to the back-yards of all other extant civilizations located on *terra firma* in the Old World⁴—had been captured by Russia from Eurasian Nomads among whom the Mitanni had been the first to flood over the domains of adjoining moribund sedentary civilizations. The collisions with one another into which these sedentary civilizations had continued to fall since the Mitanni had implicated an Egyptiac Civilization in a Sumeric Civilization's fate had provided so many occasions for epiphanies of higher religions. At least twelve of these⁵ had sprung from the impact made on six Oriental civilizations by an Hellenic Society which had radiated its culture as far as Japan in one direction and Britain in another. Yet none of these expansive movements, before the expansion of the Western Society, had ever been world-wide in the literal sense on the military and the political as well as on the commercial and the cultural plane. For example, the Roman Empire and the Han Empire had coexisted, not only on the face of the same planet but within the bounds of the same continent, for some two hundred years without ever coming into direct military or even political contact with one another—if the diplomatic mission from Marcus Aurelius, whose arrival in A.D. 166⁶ is recorded in the Posterior Han Dynasty's annals, is to be written off as having been in reality perhaps no more than an isolated private commercial venture—and in this classic case even the convulsions of one of

the two contemporary empires in its death agony did not impinge upon the survivor, as a post-Sumeric *Völkerwanderung* had impinged upon the Egyptiac World. When the Han Empire went to pieces at the turn of the second and third centuries of the Christian Era, the inhabitants of the Roman Empire remained unaware that an earth-shaking event was occurring at the opposite extremity of the Old World; and conversely, when, some two hundred years later, the Roman Empire in its turn went to pieces at a time when, in the Far East, a new society was beginning to emerge from the Han Empire's ruins, this nascent Far Eastern Civilization was not thrown back into chaos by the Roman Empire's fall. In the days of the Han Empire and the Roman Empire, human destinies had not yet been gathered into one basket, and so, though some eggs were constantly being broken, there were always others left intact.

The freedom which an Hellenic and a Sinic 'universal state' each still enjoyed to work out its own destiny without interference from the other appears the more remarkable when we recollect that neither of these 'oecumenical' empires was confined within the bounds of the single civilization that had brought it to birth. Each of them also embraced portions of the domains of other societies¹ and was consequently regarded by its inhabitants as being coextensive with Mankind itself. In a Westernizing World of A.D. 1950 which had not yet been united politically in a universal state, any such illusion would have been impossible for the members either of the supra-national community gravitating round the United States or of the community of the same order of magnitude gravitating round the Soviet Union; for, however tenuous might be the commercial contacts between these two groups of countries by comparison with the web of either group's internal trade, the competition between them in military technology and in political propaganda was so intense that the members of either were acutely aware all the time of the other community's existence and activity. The unification of the whole habitable and traversable surface of the planet, thanks to Western enterprise, had by this time gone so far on this plane of politico-military rivalry that there was reason to fear that, in this highly charged and at the same time highly conductive atmosphere, there might prove not to be room, even within the wide limits of a spaciouly all-inclusive *Oikoumenê*, for both a sovereign independent Soviet Union and a sovereign independent United States, in spite of the auspicious fact that—in contrast to a Germany and a Japan who, between them, had detonated the Second World War—either of these giants was, on the economic plane, a 'satiated' power still possessing within its own boundaries immense reserves of undeveloped non-human resources and correspondingly immense opportunities of finding innocently productive employment for a growing population for as long a time as could be seen ahead. In A.D. 1950 the United States and the Soviet Union were enjoying freedom from want, but not freedom from fear.

If the charge with which an ever more high-powered Western technique and organization had thus loaded the now perilously conductive atmosphere of a not yet politically unified twentieth-century Western-

¹ See VI. vii. 63.

izing World were ever to be detonated by some carelessly or malignantly ignited spark, the resultant military, political, and spiritual explosion would sweep from end to end of the *Oikoumené* as it vented itself with all the physical force of a post-Modern Western technology which had vastly heightened the destructiveness of the weapons at Man's command between A.D. 1929 and A.D. 1950 and was still, so far as the layman could learn, triumphantly advancing along the same suicidal course. A world-wide catastrophe might leave not a single egg unbroken in the solitary basket into which all human destinies had now been gathered.

In a Third World War fought with atomic or bacteriological weapons, it seemed, indeed, improbable that the Angel of Death would overlook even those nooks and corners of Man's terrestrial habitat which, till recently, had been either so uninviting or so inaccessible, or both, as to give their poor, weak, backward inhabitants a virtual immunity against the unwelcome attentions of 'civilized' militarists. In a talk given at Princeton¹ just three weeks before the enunciation of the Truman Doctrine of American support for Greece and Turkey against Russian pressure,² the writer had given play, half seriously and not wholly in joke, to the fancy that, if a Westernizing World were to allow itself to fall into a Third World War, the sequel might be a rendering, in real life, of one of Plato's myths in which the Athenian philosopher imagines the mountain-shepherds periodically issuing from their fastnesses in order to build up a new civilization on the vacated site of an old one that has perished in the latest of a number of periodic cataclysms.³ In the imagery of a Collective Subconscious Psyche in the Age of the Civilizations, 'shepherds' had come to symbolize the unspent and unspoiled primitive human potentialities for creation that God had still held in reserve after He had led a sophisticated majority of Mankind into the temptations that had worsted Cain the husbandman⁴ and Cain's son Enoch the city-builder,⁵ and their heir Tubal-Cain the smith.⁶ Whenever Man in Process of Civilization had come to grief in essaying this most recent, and perhaps most hazardous, of all human enterprises up to date, he had always, so far, counted on being able to draw upon the reserve power latent in still primitive brethren of his whom he had driven out of those choicer portions of the Earth that he had appropriated as his own domain, 'to wander about in sheepskins and goatskins in deserts and in mountains';⁷ and, in the past, these comparatively innocent survivors of the children of Abel had heaped coals of fire on the heads of the children of Cain by coming to their murderers' rescue when the Cainites' sins had found them out. A shepherd from Ascræ, on the foothills of Mount Helicon, had spoken the prologue to the tragedy of Hellenic history, and shepherds from the Negeb, on the fringes of the Arabian Desert, had stood by the cradle of Christianity in Bethlehem.⁸ In his

Platonizing *jeu d'esprit* the present writer had suggested in A.D. 1947 that, if the Western Civilization in which he and his audience were implicated were to inflict some major catastrophe on the *Oikoumenê*, the task of launching, all over again, a cultural enterprise that had been on foot for the last five or six thousand years might perhaps fall to Tibetans hitherto safely ensconced behind the ramparts of their plateau or to Esquimaux hitherto snugly nestling against an innocently inclement ice-cap that was a less vicious neighbour than any *homo homini lupus*.¹ Within the three and a half years that had elapsed between the delivery of that address and the writing of the present lines in the still peaceful precincts of the same university town, these tentative fancies had been overtaken and ridden down by the march of historical events. At the moment of writing in December 1950, an invading Chinese Communist expeditionary force was reported to be *en route* for Lhasa, while Esquimaux who had formerly been happy in having no foe or friend except Physical Nature found themselves in the fairway of a transpolar bombing-route between the basins of the Volga and the Mississippi, and of a *ventre-à-terre* invasion-route, across the ice-floes of the Behring Straits, from the once sequestered habitat of the primitive denizens of the north-eastern tip of Russia-in-Asia into an Alaska that was divided from the main body of the Continental United States by nothing but a Canadian 'Polish Corridor'.

Thus a now ubiquitous Western Society held the fate of all Mankind in its hands at a moment when the West's own fate lay on the finger-tip of one man in Moscow and one man in Washington who, by pressing a button, could detonate an atom-bomb.

These were the facts that led the present writer reluctantly to endorse in A.D. 1950 the conclusion, reluctantly reached in A.D. 1929, that an inquiry into the prospects of the Western Civilization was a necessary part of a twentieth-century study of History.

¹ See V. vi. 161-2.

B. THE INCONCLUSIVENESS OF *A PRIORI* ANSWERS

(I) THE INCONCLUSIVENESS OF STATISTICS

WHAT were the Western Civilization's expectations of life in A.D. 1950 or 1952? On first thoughts a student of History, taking an observation in either of those years, might be inclined to rate the West's current expectations low, considering the well-known prodigality of Nature. The Western Civilization, after all, was one out of no more than twenty-one representatives of its species—or, at most, no more than thirty if the number were to be assessed at the highest possible figure by including four arrested civilizations and five abortive civilizations in the count. Was it rational to expect to see the twenty-first, or even the thirtieth, civilization on trial succeed in avoiding the failure that had been the history of all other civilizations up to date? Success would mean either finding some hitherto untravelled way for a civilization to go on living and growing in *saecula saeculorum*, or else creating a mutation that would generate a new species of society. Considering the number of failures that had been the price of each dearly bought success in the past history of the evolution of Life on Earth, it might appear improbable that, in the history of a species still so young as the civilizations were, any representative of the third generation would have been cast for the part of Fortunatus. Yet, if a twentieth-century inquirer's first thoughts did incline towards this pessimistic conclusion, his second thoughts were likely to enter the caveat that so momentous a question could not be disposed of so easily.

The thesis that, in the evolution of Life, it required many more than twenty or twenty-nine failures to pay for one success was, after all, an inference from empirical evidence; and the particular evidence from which this particular inference was drawn was the experience of Life, not at the human, but at a pre-human, level. The dicta that thirty issues of a species was a very small number, and that a species that could not yet muster more than thirty representatives was a very young species, might be justifiable in the mouths of naturalists studying spiders or beetles or perhaps some far more primitive manifestation of Life than these. It might be true that, when Nature had been engaged on the evolution of rudimentary organisms, she had been apt to coin hundreds and thousands and millions of specimens of a type in order to give herself the off-chance of making, at the millionth or the million-millionth strike of the die, a lucky hit that would produce either an execution of her design that was a close enough approximation to it to be worthy of being perpetuated or alternatively an adumbration of some novel and superior design which would render the type now on trial obsolete and therefore superfluous. At this relatively low level of Nature's creative activity, experience might indeed suggest that the twentieth or thirtieth representative of a type would have little chance of turning out to be the successful

exponent of it. It might even be warrantable to draw from this limited experience the general inference that it was Nature's way, in all her creative work, to deal in prodigally large numbers. This generalization, however, might prove to be legitimate only in virtue of being barren; for it gave no clue for translating the abstract concept of 'a large number' into any single order of magnitude that could be warranted to hold good uniformly for all Nature's creative activities at all levels.

In the evolution of species of plants, insects, fishes, or other pre-human living organisms, twenty or thirty would have been, no doubt, not 'large numbers', but almost ridiculously small numbers; but, for the same creative purpose of Natura Creatrix, these same numbers might well be, not small, but large, when the species on which Nature was working was, not an organism, but a society, and when the living creatures whose fields of action intersected in this social arena¹ were, not spell-bound ants or bees, but human beings endowed with consciousness and freedom of choice. It was true that, even in this context, twenty or thirty were not very large numbers on the level of human societies of the primitive species; for, though the known number of representatives of this species did not run to millions or million-millions, it did run to hundreds and perhaps thousands.² The species now in question was not, however, the primitive human societies; it was the civilizations; and these differed so greatly from the primitive human societies—not to speak of any pre-human manifestation of Life—that any evidence derived from the experience of Life at these other levels would be irrelevant to an inquiry into a civilization's prospects. Second thoughts thus gravitated towards the negative conclusion that it was impossible to give any rational *a priori* answer to an inquiry into the Western Civilization's expectation of life because it was impossible to find any significant statistical basis on which an answer could be founded. While statistics lent no support to the egocentric illusion harboured by a Western Civilization which felt confident that the twenty-first civilization on trial was bound to triumph because this particular candidate happened to be the Western Civilization itself, statistics lent no support either to a dogma that, in the mintage of any species of any manifestation of Life whatsoever, twenty-one must be too low a figure to qualify for success. The statistical record of one species could not be invoked to lay down the law for the statistical prospects of any other species; and, where success or failure hung on the issue of Challenge-and-Response, success and failure were unpredictable. 'The wind bloweth where it listeth.'³ 'The Kingdom of God cometh not with observation.'⁴ 'The day of the Lord so cometh as a thief in the night',⁵ and the hour at which the thief will come is never known beforehand by the householder.⁶

(II) THE INCONCLUSIVENESS OF FEELINGS

When a twentieth-century Western inquirer into the prospects of the Western Civilization had recognized that a statistical approach to his problem was impracticable, he was still confronted by a pair of emotional *a priori* answers that he must take into consideration before proceeding to examine the testimony of the civilizations themselves, in order to see what light might be thrown on the prospects of the Western Civilization by a synoptic view of the recorded experiences of the twenty or thirty known representatives of the species. The two emotional answers were mutually contradictory; and the writer of this Study, who had been born into the Western World in A.D. 1889, had lived, by A.D. 1952, to see feeling in the West begin to lose faith in a self-complacent outlook which had previously been taken as a matter of course, and begin to revert to an alternative outlook that was, not merely different, but antithetical.

The outlook prevalent among people of the middle class in Great Britain at the earliest date in the last decade of the nineteenth century of the Christian Era at which the writer had begun to be aware of the psychological atmosphere of his social milieu was something that was best conveyed in caricature. In this milieu in the eighteen-nineties the feeling was:

‘History is now at an end; this history is therefore final’;¹

and at this date this *Weltanschauung* was shared with an English middle class by the children of the German and the Northern American victors in the latest bout of Modern Western wars (*gerebantur circa* A.D. 1848–71). The beneficiaries from this aftermath of the General War of A.D. 1792–1815 had not, by then, begun to suspect, any more than their English ‘opposite numbers’ had, that the Modern Age of Western history had been wound up only to inaugurate a post-Modern Age pregnant with imminent experiences that were to be at least as tragic as any tragedies yet on record. At the close of the nineteenth century even a German middle class, that was then still permitting itself to indulge in criminally irresponsible day-dreams of more *frisch fröhlich* six-weeks’ wars, was of the same mind as its North American and English ‘opposite numbers’ in its workaday sober senses. In these three provinces of a post-Modern Western World an unprecedentedly prosperous and comfortable Western middle class was taking it as a matter of course that the end of one age of one civilization’s history was the end of History itself—at least so far as they and their kind were concerned. They were imagining that, for their benefit, a sane, safe, satisfactory Modern Life had miraculously come to stay as a timeless present. ‘History is now at an end’ was the inaudible slogan of the celebrations of Queen Victoria’s Diamond Jubilee in A.D. 1897, which made a vivid and lasting impression upon the present writer’s childish imagination; and ‘this history is therefore final’ was the invisible motto on the title-page of a topical publication—*Sixty Years a Queen*²—which was the same child’s earliest source-

book of Western history in the nineteenth century. The assumption that the final product of those sixty years A.D. 1837-97 had come to stay was patently contrary to reason, considering that the pictures with which the text of *Sixty Years a Queen* was copiously illustrated presented a fascinatingly fast-moving pageant of change in every department of life, from Technology to Dress, in which change could clothe itself in visual form. In A.D. 1952 it was manifest in retrospect, even to the duller eye, that this visual evidence had portended, not a perpetuation of the fleeting circumstances of late-nineteenth-century English middle-class life, but a revolutionary transformation of the ephemeral Victorian scene along the grim lines actually followed by the course of History within the next half-century. An oracular foreboding of the future was, indeed, uttered at the time by the Subconscious Psyche through an incongruous poetic medium. Yet Rudyard Kipling's *Recessional* made little impression on the contemporaries of a Late Victorian poet who had found himself writing these ominous lines at an imperious Muse's dictation. In the United Kingdom, as in Germany and in the Northern United States, the complacency of a post-Modern Western bourgeoisie remained unshaken till the outbreak of the first post-Modern general war in A.D. 1914.

English middle-class Conservatives for whom the Millennium had already arrived, and English middle-class Liberals for whom it lay only just round the corner, were, of course, aware that the English working class's share in the middle class's economic prosperity was shockingly small, and that British subjects in most of the colonies and dependencies of the United Kingdom were not enjoying a self-government that was the privilege of their fellow subjects in the United Kingdom itself and in a few other dominions of the British Crown; but these political and economic inequalities were discounted by Liberals as being something remediable and by Conservatives as being something inevitable. Citizens of the United States at the North were similarly aware, for their part, that their own economic prosperity was not shared by their fellow-citizens at the South, and that the fathers of these Southern contemporaries of theirs had seceded from the Union and had been brought back into it only by the *force majeure* of the North's crushing victory over the South in a terrible civil war. Citizens of the German Reich were aware that the inhabitants of a 'Reichsland' annexed from France after her crushing defeat in the Franco-Prussian War of A.D. 1870-1 were still French at heart and that the rest of a French nation which had not yet ceased to be a Great Power was still unreconciled to the amputation of the ceded departments. At the turn of the nineteenth and twentieth centuries France was still entertaining thoughts of a *revanche*, and the subject population in Alsace-Lorraine was still dreaming the same dream of an eventual liberation as other subject populations in Slesvik, Poland, Macedonia, and Ireland. These dissatisfied contemporaries of a sated German, British, and North American bourgeoisie were nursing national grievances and national aspirations which did not permit them to acquiesce in a comfortable belief that 'History' was 'at an end'; indeed they could not have continued, as they did continue, to keep alight the

flickering flame of a forlorn hope if they had succumbed to a *Weltanschauung* which, for them, would have spelled, not security, but despair. Yet their unwavering confidence that a, to them, intolerable established régime must be borne away, sooner or later, by Time's 'ever rolling stream' made little impression on the torpid imagination of 'the Ascendancy'. 'As a sheep before her shearers is dumb, so he openeth not his mouth';¹ and, though 'the Ascendancy' was under a delusion in mistaking for an intimation of consent a silence that was inspired by the watchword 'N'en parlons jamais, y pensons toujours',² there was in A.D. 1897 no living man or woman, even among the most sanguine-minded prophets of a nationalist or a socialist revolution, who dreamed that a demand for national self-determination was going to break up the Hapsburg, Hohenzollern, and Romanov empires and the United Kingdom of Great Britain and Ireland within the next twenty-five years, and going to spread, within another twenty-five years, from a few sore spots in Western Europe and in Orthodox Christendom to the uttermost parts of the Old World, or that a demand for social democracy was going to spread from the urban working class in a few precociously industrialized provinces of the Western World to the peasantry of Mexico and China. Gandhi (*natus* A.D. 1869) and Lenin (*natus* A.D. 1870) were then still unknown names; and the word 'Communism' then commemorated a lurid event in the past that had been the last eruption of History's now extinct volcano. This ominous outbreak of savagery in a Parisian underworld in A.D. 1871 was written off by optimistic post-Modern Western minds as an abnormal atavistic reaction to the shock of a startling military disaster, and there was no discernible fear of the recrudescence of a conflagration that had been smothered now for longer than a quarter of a century under a bourgeois Third Republic's wet blanket. In 1897 a Western bourgeois gentilhomme's sleep was not being seriously disturbed by prophetic nightmares.

This irrational faith had been fortified by experience, for the *fin-de-siècle* prosperity of the Western middle class was not a thing of yesterday. In Germany, it is true, the mirage of a golden age had not dawned on the bourgeoisie until A.D. 1871, when the victory of the German states over France and their unification in a Second Reich had been followed by a titanic local outburst of industrial development. There had been a contemporaneous local outburst of Industrialism in the North-Eastern United States after a victory of the North over the South in A.D. 1865 that had re-established and consolidated the Union; but in the United States the Golden Age had been inaugurated by a victory over Great Britain in A.D. 1783 through which the insurgent colonies had won the recognition of their independence; and in the history of Great Britain an inquirer bent on tracing the Golden Age back to its origins would have to look behind the General War of A.D. 1792-1815, which had made a victorious Britain the workshop of the World as well as the ruler of the waves, to 'the Glorious Revolution' of A.D. 1688 and perhaps

¹ Isa. liii. 7.

² The watchword suggested for the guidance of members of the rising generation in France, on the morrow of her loss of Alsace-Lorraine in A.D. 1871, by a French statesman of an older generation (? Paul Déroulède).

to the Restoration of the Monarchy in A.D. 1660. In the middle-class life of England, at any rate, the entries in Pepys' diary testify to a sense of security, comfort, and prosperity that was perhaps not attained in the middle-class life of the Lowlands of Scotland until after the suppression of the last and boldest Jacobite insurrection in A.D. 1745; and Pepys' incidental and *insouciant* expressions of confidence were deliberately echoed in bolder accents by Gibbon in 'General Observations on the Fall of the Roman Empire in the West'¹ which must have been finally passed for the press at some date in the first quarter of the year 1781,² when Gibbon's own country was in what this English historian will have felt to be a serious plight if he was appraising it by his own serene century's exacting standards.³

In this parenthesis in *The History of the Decline and Fall of the Roman Empire* Gibbon was inquiring 'whether Europe is still threatened with a repetition of those calamities which formerly oppressed the arms and institutions of Rome', and his conclusion was that the Late Modern Western Society of his day stood in no danger of being destroyed either by domestic civil war or by barbarian invasion. The perpetuation and progressive improvement of her present Golden Age were assured, as Gibbon saw it, by a political constitution which—in contrast to the debilitatingly despotic centralization of political authority in the Hellenic World under a *Pax Romana*—was a felicitous balance between parochial autonomy and oecumenical unity.

'In peace, the progress of knowledge and industry is accelerated by the emulation of so many active rivals;⁴ in war, the European forces are exercised by temperate and undecisive contests. . . . It is the duty of a patriot to prefer and promote the exclusive interest and glory of his native country; but a philosopher may be permitted to enlarge his views, and to consider Europe as one great republic, whose various inhabitants have attained almost the same level of politeness and cultivation. The Balance of Power will continue to fluctuate and the prosperity of our own or the neighbouring kingdoms may be alternately exalted or depressed; but these partial events cannot essentially injure our general state of happiness, the system of arts and laws and manners which so advantageously distinguish, above the rest of Mankind, the Europeans and their colonies.'

Gibbon's optimistic appraisal of the Western Civilization's prospects in his day was no mere personal *parti pris*. Among the cultivated minority

¹ This passage of Gibbon's work has been quoted already in this Study in III. iii. 311; IV. iv. 148 and 283; V. v. 625, n. 1, and 644. It is so germane to the subject of the present Part of this Study, and at the same time so alien to the outlook of a Western student of History speculating on the prospects of the Western Civilization in A.D. 1952, that it has been reprinted with a running commentary in an annex on pp. 741–57, below.

² The first draft for this passage may have been written as early as A.D. 1772. See IV. iv. 148, n. 3, and compare III. iii. 311 and V. v. 644, n. 3.

³ In the first quarter of the year 1781 Great Britain was at war with France and Spain and Holland, as well as with the Thirteen Colonies; the Northern Powers of Europe were maintaining an unfriendly 'armed neutrality' for which the term 'non-belligerency' had not yet been coined; and in the North American theatre of operations a campaign was about to open which was to decide the outcome of the war disastrously for the British cause.

⁴ Compare the passage in Hume's essay *Of the Rise and Progress of the Arts and Sciences* quoted in II. i. 473–4, together with the references *ibid.*, p. 474, n. 1, to variations on the same theme by Turgot, Eduard Meyer, and J. W. Headlam-Morley.—A.J.T.

in an eighteenth-century Western World there was a consensus in this sense, and the very passage of Gibbon's general observations that has just been quoted may have been a half-conscious echo of a kindred passage in Turgot's *Second Discours*, delivered at the Sorbonne on the 11th September, 1750, *sur les Avantages que l'Établissement du Christianisme a procurés au Genre Humain*.

'Tout se rapproche peu à peu de l'équilibre, et prend à la longue une situation plus fixe et plus tranquille. L'ambition, en formant les grands états des débris d'une foule de petits, met elle-même des bornes à ses ravages; la guerre ne désole plus que les frontières des empires; les villes et les campagnes commencent à respirer dans le sein de la paix; les liens de la société unissent un plus grand nombre d'hommes; la communication des lumières devient plus prompte et plus étendue; et les arts, les sciences, les mœurs avancement d'un pas plus rapide dans leur progrès. Ainsi que les tempêtes qui ont agité les flots de la mer, les maux inséparables des révolutions disparaissent: le bien reste, et l'humanité se perfectionne.'¹

As for Gibbon's optimism, this was so robust that it inveigled a temperamentally sceptical eighteenth-century mind into committing itself to a credulous declaration of faith in the perpetual progress, not merely of the Western Civilization, but of Civilization in general.

'Since the first discovery of the arts, war, commerce, and religious zeal have diffused among the savages of the Old and New World those inestimable gifts: they have been successively propagated; they can never be lost. We may therefore acquiesce in the pleasing conclusion that every age of the World has increased and still increases the real wealth, the happiness, the knowledge, and perhaps the virtue, of the Human Race.'

The history of the decline and fall of the Roman Empire had been the last chapter in the history of the breakdown and disintegration of the Hellenic Civilization,² and this disaster that had swept away an imposing society had been within the knowledge of post-Hellenic Western Man ever since the first shoots of a new civilization, affiliated to the defunct Hellenic Society, had begun to sprout among the rubble of the fallen empire's ruins at the turn of the seventh and eighth centuries of the Christian Era. Gibbon had found the subject for a monumental work in this débâcle of a universal state which was also the débâcle of the culture which that oecumenical body politic had incapsulated; and, in the first paragraph of his first chapter, he had described it as 'a revolution which will ever be remembered, and is still felt by the nations of the Earth'. Can one contemplate a skull without being reminded of his own mortality? To a Western student of History in A.D. 1952 it was not at all surprising that Gibbon's subject should have impelled him to inquire whether his own Western Society might not be in danger of being overtaken, in its turn, by an antecedent Hellenic Society's fate. From a mid-twentieth-century Western angle of vision it did, however, appear amazing that, when Gibbon had once faced this question, he should have answered it, in transparent good faith, in the extravagantly optimistic terms of the sentences above quoted.

¹ Turgot, A. R. J.: *Œuvres* (Paris 1844, Guillaumin, 2 vols.), vol. ii, p. 599.

² See IV. iv. 58-63.

As the present writer was rereading this passage of Gibbon's history on the 11th December, 1950, his mind's eye conjured up a Late Medieval Florentine picture of saved souls in Heaven leaning lazily over a marble balustrade in order to make their bliss full and perfect by gazing down upon the torments of the damned in Hell; and, among the participants in this Satanic celestial recreation, a dreaming mind's roving glance singled out one figure whose ungainliness would have made it conspicuous, even if the uncouth effect had not been enhanced by an outlandishly un-medieval costume. There, in an uncongenial Dantesque Paradise to which he had unwittingly sentenced himself by embracing the irrational belief that 'History' was 'now at an end', stood Gibbon, in silver-buckled shoes, knee-breeches, tie-wig, and tricorne, looking down on wretched creatures, born under a different star, who had been floundering in the turbid waters of History in days before the flow of Time's 'ever rolling stream' had been cut off, for the benefit of the eighteenth-century English historian and his kind, by the advent of their secular Millennium in A.D. 1688.
